

PUBLISHERS' ANNOUNCEMENT!

FOURTEENTH VOLUME OF THE AMERICAN AGRICULTURIST, THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

The American Agriculturist,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the Agriculturist.

N. B.—The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume, for the bound work.

COMPREHENSIVE IN ITS CHARACTER.

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the Agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with slow *monthly* issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "Farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature, and they look for the united support of all the intelligent Farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor, by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of Agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers *only* that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon *its own merits*; and the laborious zeal and ability which it brings to the support of the interests of the farmer. It is *untrammelled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great Agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the control and management of **MR. ORANGE JUDD, A. M.**, an experienced farmer, whose knowledge of practical chemistry, soil analysis, &c., will enable him to sift the "scientific" nostrums and humbugs of the day. Mr. Judd is wholly independent of business connections of any kind, and will take good care that no collateral interests shall, in the slightest degree, interfere with the *truthfulness* and *reliability* of every department of this Journal.

Mr. A. B. ALLEN, one of the originators of the *American Agriculturist*, in 1842, and for a long time principal editor, will still continue to aid its progress by his counsel and editorial contributions.

Constant editorial assistance will also be given by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical Agriculture, and, by a large number of other eminent Agricultural and Horticultural writers.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than **FOUR CENTS** a number, of sixteen large pages; and to large clubs for a trifle less than **THREE CENTS**. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and Post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers.....	\$2 00	A YEAR, \$2 00
“ Clubs of 3 do.	1 67	“ 5 00
“ “ 5 do.	1 60	“ 8 00
“ “ 10 do.	1 50	“ 15 00

The money always to accompany the names for which the paper is ordered.

The Postmaster, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Postmaster, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, Weekly Tribune, or Weekly Times, or any other paper or periodical in this City, the cost not exceeding two dollars per annum. The above are not given where book premiums are paid.

Subscriptions may be forwarded by mail at the risk of the Publishers, if inclosed and mailed in the presence of the Postmaster, and the name, number and letter of the bill registered.

Communications for the paper should be addressed to the Editors; Subscriptions, Advertisements, and all matters relating to the business department, should be addressed to the Publishers,

ALLEN & CO., No. 189 Water-st., New-York.

SUGAR BEET.

We cannot too often or too confidently recommend the cultivation of this excellent field crop. It is a great yielder, hardy, easily raised, and is superior we think to any vegetable grown for milch cows and fattening cattle, especially when fed raw. We have grown large quantities for our own use the past seventeen years, and can therefore speak of it practically and experimentally. One of our neighbors—a lady farmer—informs us that she made thirty pounds of butter per week from six cows in December, fed upon hay and Sugar Beet. She adds, that the butter was fully equal to the best made in September and October on rich pasture.

The Sugar Beet does best in moderately rich loamy soil, but will grow where any other root does. The seed should be soaked two to four days in tepid water previous to planting, so as to insure its germination. If planted without first soaking, its shell is so hard it is a long time germinating. Hence the ill success of many who do not take this into consideration.

For field cultivation the rows should be three feet apart, so as to admit working easily with the cultivator among the rows. The plants, when finally thinned out, should not stand nearer to each other than six inches in the row. It can be pulled and secured in the fall the same as turnips.

The best variety is the White Silesian, though the French Yellow has been so much improved lately, we are informed it has become nearly as good as the latter. We have never found it to keep so well.

The beet requires about four pounds of seed per acre, and can be planted very rapidly in drills with a seed-sower, costing about eight dollars.

HOW SHALL SHORT-HORN CATTLE BE IMPROVED?

It is conceded by all whose judgment and experience are of any value, that Short-horn cattle as a whole, are superior to any other breed; and that in the loin, quarters, brisket, handling, early maturity, and quick feeding, they particularly excel; and for milking, when properly bred, taking the average quantity and quality into consideration, they are unsurpassed.

What then do Short-horn cattle lack to give them perfection?

We answer, that in comparison with the recently improved Devons, they are generally in-

ferior in girth round the heart; they lack their full, meaty crops; and have nothing comparable to their fine shoulders, forming that beautiful symmetrical outline, gradually lessening and uniting them to the neck. In the set of the head the Short-horn is equal to the Devon, it is also rather finer in its anatomy; but in brilliancy and beauty of eye, the latter excels.—There are exceptions to this remark upon the eye, in some few tribes of Short-horns; among which are the true Duchess, as bred by the late Mr. Bates, and the Princess, as bred by Mr. Stephenson—no Devons ever excelled their eyes.

We now come to the question which heads this article, How shall Short-horn cattle be improved?

Simply by choosing those bulls that have all the good qualities in perfection in which the Short-horns now excel, and which are also superior in the eye, shoulders, and girth round the heart. These should be bred from in preference to all others. In this choice of bulls take the youngest, as the improvement is likely to be more marked and rapid from them. The reason for this is, that as bulls grow older their shoulders grow coarser, and as like produces like, calves by very aged bulls are not generally so fine as those got by younger ones. By steadily persevering in this course we may at length arrive at perfection in cattle. The improvement, however, will be slow; and we trust that those who commence it, will not be impatient in their attempts. It has taken nearly a half century to breed off the coarse dewlap, and put on the fine head and symmetrical shoulders of the Devon—his great girth round the heart we believe he originally possessed.

We shall be much obliged to the breeders of Short-horns, who have either males or females, which they consider superior in the fore rib, girth round the heart, full in the crops, and with fine shoulders, if they will inform us of the fact, either publicly or privately, as most agreeable to them. We have something to propose which we think will be found to their future advantage.

SHALL I USE SPECIAL FERTILIZERS?

A CORRESPONDENT from Windham County, Ct., writes: "As you are particularly acquainted with our soils, will you give your opinion as to whether it will pay for me to use special fertilizers, such as guano, super-phosphate of lime, &c."

Had we space we would reprint several pages on the subject of manures. We place first among fertilizers good barn-yard manure which has been properly preserved from loss.

With regard to the special fertilizers, we still say as we always have said, do not go into these extensively at first. If we had an *exact*, reliable analysis of a soil we could judge *somewhat* of its defects, and prescribe what would *probably* remedy these defects; but after much practice in actual analysis, we do not by any means recommend every farmer to have his soil analyzed. We *know* that a large proportion of soil analysis are *worse* than *worthless*—for they lead astray—though we should highly value one upon which we *could* depend. We would not give a fig for a *thorough* analysis, which did not cost the operator from \$15 to \$50 in time and chemicals.

But a good result can be arrived at without aid from the chemist in *applying* manures, however much he may assist in *collecting* and *manufacturing* them. Every farmer should *experiment* for himself. As for guano it can hardly fail of producing good results, except in the *very driest* seasons, and then no manures have much effect, not even muck, the coolest and moistest of all; but these results are not always profitable ones. Experiments or trials upon every distant class of soils can only determine this matter of profit. Super-phosphate of lime, if *properly* and *honestly* manufactured, is a valuable fertilizer for a variety of crops on many soils. It has produced marked results on turnips and corn as well as on other crops.

Our advice is, *try* small quantities of both of these fertilizers, on a variety of soils and crops. Let the trials be made carefully and thoroughly, and be repeated for several seasons, wet, dry, and medium, to guard against the accidental results that may arise from unpropitious weather.

Let the cost of these experiments for the first season not exceed \$25 to \$100. The chances are that you will not suffer loss, if you do not profit by the operation; but do not throw any large sums upon adventures where you are not pretty sure of gain. Guano should not be purchased of irresponsible and unknown persons, but be procured as directly as possible from the Peruvian agent, or from established and reliable dealers.

Super-phosphate of lime make yourself, if you have the facilities. If not, get a few bags of the best you can. We recommend no man's make. There are doubtless several good articles in the market. We prefer that which is essentially bones and sulphuric acid. Ammonia added to this doubtless increases its value for most crops, but ammonia in the form of any salt, is too dear to be found in any article put up for profit. We doubt not that a mixture of super-phosphate and guano is often the best, but every man can more safely make the mixture himself, by shoveling them over together upon a floor, (the plan fol-

lowed by most if not all manufactures,) and he will then know how much of each is contained in his mixture.

A NUMBER OF QUESTIONS.

THE following letter contains several important questions, a full answer to each of which would fill a whole number of our paper. As the inquiries relate to operations at various seasons of the year, we will print them here, and from time to time answer them by articles on these subjects. The questions will also serve as topics for our correspondents, who will confer a favor upon their fellow-workers, by giving plain statements of their own methods, and the peculiar advantages these methods seem to possess.

For the American Agriculturist.

Will you oblige a subscriber and constant reader of the *Agriculturist*, by replying to a few questions in relation to farming matters?

If in your power, please detail the minutia of the method of harvesting Indian corn usually practised at the north—viz: cutting up the corn, stalks, fodder and all, and putting it in shocks to cure and remain till gathered. The universal method here is topping and stripping the fodder, and gathering the corn from the standing stalks, which are subsequently cut up and fed to stock or burnt. The former method is considered superior, and I am anxious to learn its details, as I wish to adopt it.

Please state the usual mode of proceeding—the number of stalks to a shock—whether untied when gathering the corn, or gathered standing—may the shocks remain standing all winter after the corn is gathered—is this method more or less expeditious and troublesome than topping and stripping, and then gathering—what the best implement for cutting, and whatever else you may deem relevant.

Also, what is the best disposition to make of farm-yard manure raised during the spring and summer, intended for the next year's corn crop? Should it be hauled on the land and the heaps covered with soil; or spread and plowed in—or left uncovered? The soil which will be in corn next year is rather sandy and shallow, which I wish to stiffen and deepen, and I have some idea of plowing in the manure during the fall and early winter in four furrow ridges, plowing so deeply as to bring to the surface about an inch of the sub-soil, (clay) to be pulverized by frost during the winter; these ridges to be reversed in spring, and the land harrowed before planting. Would or would not this be advisable? I know sandy soils ought not to be plowed in autumn, but my object in this case is to expose the sub-soil turned up to the action of the atmosphere and frost. When should such land be sub-soiled? in fall or spring? What the size and price of the smallest sub-soil plow?

I have at command a quantity of rubbish (1000 to 2000 bushels) from a burnt house, which I wish to use as manure. What is the best mode of using it? I have intended to use part of it on corn land, broad-cast, after flushing and before harrowing; and to spread part during the summer on land intended for wheat next fall. Your advice, however, shall govern me in the disposition of it.

What is the best method of preparing carrot seed for drilling, so as to secure regularity of sowing and early germination?

Would saw-dust, or not, be a good divisor with guano, and a fixer of the ammonia?

THOS. R. JONES, JR.

CANADA THISTLE.

MESSRS. EDITORS:—In reply to your solicitation, I would say, the Canada Thistle is one of the most troublesome weeds with which the

farmer has to contend. It spreads very rapidly from the seed, which makes it more difficult to exterminate, because the thorough-going farmer may perform the necessary labor to keep his own fields clear, while at the same time his next neighbor may be cultivating them with but little less care than his corn or wheat. With such a state of things, there can be but little hope of keeping entirely clear of them.

The Canada Thistle may be killed by summer fallowing, but ten chances to one if the next gale does not waft on its wings ten thousand of those little germs of life (the seeds) to take the place of so many hundred just destroyed. The most effectual remedy we have ever tried in this section, is to cut them in the month of July, when the stalk is hollow, and before the seeds are ripe enough to germinate. Cutting them thus, when the stalk is hollow, allows the stub to fill up with water, which kills it. Although you may not kill them all the first or second year, this course, persevered in, will use them up of a surety. It is beneficial to scatter a little salt over them after cutting, and after they are wilted turn cattle or sheep upon them. The animals will eat great quantities of them after they are thus salted and wilted.

SUPER-PHOSPHATE OF LIME.

IN your paper of the 23d of December last is an article with the above caption, in connection with which you invite further communications upon the same subject.

Though not a practical agriculturist, I have given considerable attention to horticulture, and I have used no fertilizer with the general effect of which I have been so well satisfied, as with the one now under consideration. The kind which I have used is manufactured exclusively of bones—finely ground—and sulphuric acid, and when prepared is a fine dry powder, and very convenient for use as a top-dressing, or otherwise.

I have tried this manure on all kinds of garden vegetables, on grass, and on plants and shrubbery generally, and with the very best results. On potatoes, Lima beans, and vines of every description, I have found it eminently beneficial. And it is a complete protection against the ravages of grubs, cut-worms, and the bugs which often destroy young vines. Since I have used it, I have had no trouble from any of these insects.

One hot forenoon last season, after a gentle rain during the previous night, I went into my garden and found that full one-half of my young cucumber plants had been cut down by the striped bugs. I immediately sprinkled a handful of the powdered phosphate over them, and from that time not another plant was injured; the vines grew luxuriantly, and continued to bear well till late in the season.

I intend to make further experiments with this article, and hope others will do the same.

HENRY D. SMITH.

Middletown, Ct., Feb. 27, 1854.

For the American Agriculturist.

TURNIPS FOR COWS.

NOTICING an article in your last paper, on feeding turnips to cows, and your call for information, I will endeavor to give you my own experience. The sixth experiment I am unable to try now, not having raised any turnips this year.

Two years ago having raised a large crop, I gave them freely to the cows, which they fattened upon, but I soon found the milk was getting very poor. It was of a blueish color, and a gallon of it would not raise as much cream as half the quantity ought to have done, and every day it seemed to get poorer. Nevertheless the cows grew very fat. Having inquired into the cause, I immediately stopped the turnips and fed them on cut hay, moistened and mixed with chop, and in a few days the milk was rich and of a beautiful color, and twice the quantity of butter was made from it. I was then satisfied as to the cause, and I fed the remainder of the turnips to the hogs, and never will again raise them for cows. But any dairyman having the convenience of a boiler, and who will boil them with a small quantity of meal, shorts, chops, or any thing of the kind, will insure fat cows, and an abundant quantity of milk or butter. Persons fattening beeves for market will find it a good plan to feed once a day with turnips, cut into small pieces.

For the American Agriculturist.

HAVE WE A BLACK SPANISH FOWL AMONG US?

IN common with the poultry-breeders and fanciers of the country, I have been quite surprised at the decision of a committee of the judges of the National Poultry Society, who have given it as their verdict, that at the recent exhibition of that Society held in this city, there was not a pure Black Spanish fowl to be found. If these judges have spoken correctly, I think that it is high time they gave the community the points of a true Black Spanish fowl. I, for one, have always believed that the birds bred by J. P. CHILDS, and shown at the late fair by the Messrs. HAINES, of Elizabethtown, possessed all of the characteristics necessary to the perfect species, but it seems that they don't come up to the scratch. Will Messrs. GILES & BURNHAM give the public a description of a *bona fide* Black Spanish fowl? The poultry-breeding community would like to know in what points the birds bred by Mr. CHILDS are deficient? I have no interest in them, and neither Mr. C., nor their present owners—the Messrs. HAINES—have any knowledge of this communication; but information on this subject will be gladly received by others as well as by a

FANCIER.

New-York, March 6, 1854.

HORSES IN RUSSIA.

THE immense number of horses in Russia have their origin in the immeasurable extent and fertility of the meadows of the Steppes. No country in the world, either Austria in Europe, or Paraguay in America, can compete with her. Russia alone is capable of remounting a numerous cavalry within the shortest time, and of keeping it effective during the most protracted war. In the last general war, it had 65 effective regiments of cavalry, besides a numerous artillery, and 170,000 mounted Cossacks, Bashchirs, and Calmucks in the field; and in 1812-13 the Emperor Alexander ordered four reserve corps to be formed, for which in a short space of time 63,012 horses were bought. Besides these, a vast number were sold to the Austrian and Prussian cavalry out of the Government of Wolynia. But notwithstanding this extraordinary draught of horses, the statistics of 1814, taken by Professor Heim, in 28 Governments show that there were 1339 Government and private studs, containing 345,109

horses of different ages. The Grand Duke, John the Third, laid the foundation of the present system of improving the breed of horses in Russia; but the present Emperor, by an ukase of the 11th of March, 1843, directed that stallions at proper stations should be distributed throughout the Empire, and that the heretofore Military studs should be changed into Imperial. The immediate consequence of this was, that, in 1844, 470 stallions were distributed, and 12,000 mares were covered. In 1845, the former number had increased to 900; and in 1848, the number was 1337, and the number of mares, since 1844, amounted to 165,000. By this means Russia has effected in a few years, what in other countries would have occupied centuries.

And now a word concerning the races—Haimans, a Government stallion, had four descendants, which won ten prizes, and netted their respective owners 6780 silver rubles. The stock of General Chasse numbered 14, which at the different races, won 41 prizes, netting for their respective owners, 31,152 silver rubles. The descendants of Birmingham, 31 in number, won 79 prizes, amounting to no less a sum than 38,428 silver rubles. These four stallions are thorough-bred English horses, and were bought by the Russian Government, in England, at different times, for 31,436 silver rubles.

The performances on the turf of the half-breeds are no less remarkable. One horse, the descendant of Karatakos, won prizes to the amount of 2283 silver rubles. The trotting races are no less interesting; but circumstances did not allow the author to witness any.

Moscow seems to be the greatest mart for horses. At the establishment where the Government stallions are kept there is a sort of repository for horses, where they are sold by auction or private contract, similar to Tattersall's in London; with this exception, that all horses sent there for sale are examined by a veterinary surgeon previous to their admittance, and, if unsound, are rejected altogether. They charge for the keep, &c., $\frac{1}{4}$ per cent. on the produce of the sale.

There is no town in Russia where there are so many fine horses; not even St. Petersburg excepted. The merchants in Moscow are the greatest amateurs of horses. They spare no expense to procure the very best, and it is a sight that would gratify anybody, to go in the neighborhood of the exchange, about 12 o'clock to see their carriages; though some of them are no more than horse dealers. The trotters are held here in the highest esteem; the prices of them are very high, since you cannot purchase one of them under 1000 silver rubles. Ten colts and fillies were sold at 2 years old for 6000 silver rubles.—*London Veterinarian.*

FARM IMPLEMENTS IMPROVING.

The Patent Office records show, that the improvement and multiplication of agricultural implements is monopolizing a large share of the inventive genius in our country at the present time. Our columns usually contain the claims of patents relating to agricultural operations. The *Scientific American* gives the following summary:

Three patents were granted for horse-power potato digging machines; the models of two of these we have seen, but have not yet had the pleasure of seeing a large one in operation. Fifteen patents were granted for improvements in plows, and four for cultivators. No less than twenty-six were granted for seed-planters. This number is very large, considering that such machines are of recent origin, it shows the importance of this class of machines, and the dissatisfaction entertained with those already in use. The devices, patented, however, were mostly confined to the mode of distributing the seed—the novelties patented are stated to be very small, but that of B. D. Sanders, of Holli-

days Cove, Virginia, for operating the shove-rod to work the valves by friction and rotary cam, is a very good one. Three patents were granted for horse rakes, and eight for threshers and separators; one of the latter consists in having an inclined rotary cylindrical straw-carrier, supported on friction rollers. This cylinder is full of holes, and as the straw is carried up, the grain falls down through the openings. Ten patents were granted for hullers and smut machines—one of them being for washing, scrubbing, and drying the grain. One patent for a weigher combined with a winnower. The weighing apparatus is secured in such a manner to the machine, that when the measure is filled up to the proper weight, the balance tips the weighed grain, which is thrown upon inclined ways, and immediately starts off on a railroad track to a grain depot. Four patents were granted for corn-shellers; in one the ears are allowed to accumulate, to act in the mass, as an elastic bed against the spiral shelling projections. Three patents were granted for straw-cutters, and nine for miscellaneous agricultural implements, one of them being for a metallic tube scythe snath.

CULTIVATION OF INDIAN CORN.

RAISING corn has always been, and still continues to be, one of the most extensive operations of the agriculturists of this country. We perceive by examining into the circumstances of the case, that there is an astonishing amount of capital invested in this one branch of farming, and that the common profits are exceedingly small, compared with favored fields, in favorable localities. This is the subject which appears to be before the public, and its remedy requires the consideration of practical farmers.

There are several causes which directly or indirectly tend to produce this common effect, among which may be enumerated soil, tillage, seed, &c. Large crops are raised on all kinds of land in favorable seasons; yet the risk is so great, that experienced farmers seldom trust their capital in this lottery, but rather take land of a light, warm nature, that is easily tilled, and can be made productive by manuring, and is sure with care to produce a remunerating harvest. I consider a sand or gravelly loam most suitable and profitable, though most soils can, by a thorough draining and sub-soiling, be made to produce good crops of corn.

After many experiments I have adopted the following mode of operating. Take land that has been in sward two years; break with flat furrow as deep as convenient, late in autumn, before the severe frosts injure the vegetable matter; let it settle till planting season and then harrow until mellow. Be sure to harrow enough, for there is no fear of working the soil too much, and few think that one day's work in spring will save four at hoeing time. Mark both ways with a marker which will make four marks three and a half feet apart; be careful to go straight, so that you can do your hoeing with a cultivator. Plant in intersections, after putting one spoonful of gypsum in each hill. Plant good seed, and no more than you wish to grow, this will save a vast amount of bending while hoeing. At first hoeing, put a small handful of ashes on each hill; hoe two or three times, as circumstances require, and you are sure of a good growth. I find that the plaster increases the product fifty per cent., or more, which is a better dividend than all the railroads, banks, manufacturing or mining companies in the Union pay.

I harvest by cutting near the ground, and putting in small stocks before fully ripe, where it is left until cured. The stalks, if harvested in this manner, will half pay the expense of the crop; and are eagerly devoured by most kinds of stock. I find them to be the best feed ever used for cows. Butter made while feeding them is always of a beautiful color and an excellent flavor.

Under this treatment, I have always succeeded in obtaining a remunerating harvest,

while some of my neighbors often do not get corn enough to pay expenses.—FRANK PASLIN, of Malone, N. Y., in *Albany Cultivator*.

CLAIMS OF AGRICULTURAL PATENTS

FOR THE WEEK ENDING FEB. 28, 1854.

SCYTHE FASTENINGS.—S. B. Bachelor, of Louisville, N. Y.: I claim the continuous rectangular slot or opening, in combination with the ring and screw, by which I am enabled to attach any common scythe to my snath, as set forth.

SEED PLANTERS.—John S. Sydney & Joseph Young, of Wheatfield Township, Pa.: We claim the sliding section in the bottom plate, in combination with the tubes and revolving perforated plate, as described, for rendering the machine capable of hill or drill planting, at pleasure, and insuring a regularity of deposit, as set forth.

I also claim the aperture in the frame, in combination with the inclined form of the plate, for carrying off the surplus grains, and collecting them in the bucket, as specified.

SEED-PLANTERS.—Thomas D. Henson and George Rohr, of Charleston, Va.: We claim the construction, use, and application of a revolving longitudinal shaft, having series of right and left or double obliquely set beaters, and cleaning spikes for the purposes as specified.

SEED-PLANTERS.—Lewis W. Colver, of Louisville, Kentucky: I claim the combination of the loosely hinged stocks, with their teeth, shoes, and a seeding apparatus, as described, and for the purpose of mellowing the soil, opening the furrows, dropping and covering the seed at one operation, as set forth.

CHURNS.—R. W. Davis, of Rodgersville, N. Y.: I claim the manner described, of dividing the end pieces, and hanging them eccentric to the axis of the dasher in combination with the arrangement of the blades, so that the dasher may be adjusted by the resistance of the cream in revolving through it, so as to present six centripetal cutting or agitating blades to the cream, and then after the butter is produced to be adjusted by reversing the motion of the dasher, and through the resistance of the butter, so as to present but two centrifugal gathering blades for gathering the butter, working it into rolls, and expelling the buttermilk therefrom, as described.

HARVESTERS.—Solyman Bell, of Marseilles, Ill.: I claim the pins in the sickle, or their equivalents in combination with the scores in the guards, or their equivalents, so constructed and operated as to remove the leaves and stalks, and prevent the guards from becoming clogged, so as to obstruct the motion of the sickle.

COTTON-PICKER CYLINDERS.—James Pitts, of Lancaster, Mass.: I claim constructing the screen so that the periphery of the metal intervening between any two immediately adjacent orifices shall be of a length equal to or greater than that of the staple of cotton or other fibrous material to be picked, in order that the fibre shall not lap around the said periphery and become connected, attached, or tied by its ends, as stated.

I also claim the improvement of constructing the cylinder screen of a hollow perforated metal cylinder without arms or ribs, and with open hollow cylindric journals at its two ends, as stated, in order that the cotton may be drawn out of one journal by the suction draught and any obstruction removed by a person's hand and arm introduced throughout the other journal, as specified.

Additional Improvement.

PLOWS.—David Swartz, of Tonis Brook, Va.: Original Patent, dated June 22, 1852: I claim and desire to have added to my letters Patent of June 22, 1852, attaching the comb or rake to the rear end of the mold-board by a crooked cam lever or bar swivel in combination with the hand lever, whereby it can be conveniently raised and lowered by rotating it upon its axis of connection as set forth.

Horticultural Department.

FRUITS AND THEIR VARIETIES.

THE season is now fast arriving for planting fruit trees. The object of every one in planting trees is, or should be, the production of the *best* fruits of their kind in the proper seasons. Now, there are several requirements that make up the quality of the "best" fruits. We will enumerate some, and the chief of them:

1st. Suitableness to the climate where they are to grow, and their ability to withstand the rigor and change of temperature. This quality may also be termed *hardiness*.

2d. Vigorous and healthful growth, with good constitution.

3d. Proper shape of head, and spread of branches in the tree in its *natural* habit.

4th. A proper distribution of the fruit throughout the branches in *single* bearing—not in clusters, like cherries. This open habit of bearing or distributing the fruit gives it a freer growth without interference with its fellows, holds it stronger on the twig, and renders it fairer and better grown than when huddled in clusters. Some apples and pears have this last habit in a very injurious degree.

5th. Constant bearing—or, as near constant (annual) bearing as possible, in order to give a regular supply of the same fruits every year.

6th. Good size, fairness of exterior, and excellence of flavor for the various edible purposes to which the fruit is to be devoted.

The affirmative of these qualities makes up the merits which, as near as possible, every planter should provide in the fruits he plants.

Fruits otherwise may be sub-divided into two classes: for the table or dessert in their natural condition, and for cooking. For these two objects combined, few fruits are equally well adapted. The best table fruits are such as receive their full measure of excellence in flavor in their natural growth on the tree, while some of the best cooking varieties are stringent and unpalatable while raw, and only develop their full excellence under the cooking process. Every house-keeper experienced in fruits knows this. Therefore, every one planting fruit trees for family use, should understand that he needs not only the best varieties for the table and dessert, but the best kitchen or cooking varieties. Without these last, his fruit garden must be imperfect. And how is he to get the knowledge to guide him in the matter?

We shall not answer this question directly, but make a remark or two by way of caution before starting.

It is the most natural thing in the world for one who is about to plant fruit trees, to send for a nursery catalogue of repute, and consult it, to ascertain what are the best kinds for him to select. He takes it up, finds a hundred or two kinds of apples and pears, or twice that number, half as many cherries, plums, and peaches, half a dozen quinces, currants, and raspberries, besides scores of gooseberries, and grapes, if he happen to want these latter. Looking at the different names among the several varieties of the fruits, and the remarks carried out opposite to them, our young planter finds them all "good," "excellent," "productive," "great-bearer," "delicious," "hardy," "best for mar-

ket," &c., with adjectives piled up in the highest *excellentissimo* style, so bewildering to his imagination, that it is a miracle if he rises from their perusal without sighing that he has not land enough to plant the entire catalogue with such wonder-working fruits. The upshot of this examination is, that he is quite as much at fault as before he commenced his selection; and among the multitude of varieties, in all, that he has looked at, perhaps only a dozen or twenty of each, on examination will be found to be suitable to his wants, the quality of his soil, its climate, and position. Now, what is the poor man to do? He is buried in a labyrinth of apparent delicacies—made so by the zeal of the nurseryman, who will, of course, recommend his own wares—and trusting to his own choice, if not experienced, which not one in a hundred of our modern fruit-growers are, the chances are three or four to one that he chooses wrong.

There is hardly a locality embracing an area or stretch of country containing essentially the same soils, climate, latitude, and altitude in any of the old States, but what has one or more varieties of fruit of several kinds, particularly apples, more or less natural to that territory; probably originating therein, and flourishing in higher perfection of growth and flavor than any other variety in that particular place, or perhaps than any where else, although doing quite well in other localities and positions. We need instance only a few celebrated fruits to establish this fact fully. The Baldwin apple in Eastern Massachusetts; the Westfield Seek-no-further, between Hartford and Northampton in the Connecticut valley; the Rhode Island Greening, in Rhode Island and Connecticut; the Raymond, or Winter Pearmain, in the latter State; the Newtown Pippin on Western Long Island, Eastern New-Jersey, and up and down the Hudson River; the Esopus Spitzenburgh at and about Kingston, in Ulster county, N. Y.; the Philip Rick or Jonathan, in the same locality; and many other celebrated local fruits, that may be named in almost every one of our States where fruits have been long cultivated. Many of these fruits, particularly some of the above-named, flourish nearly as well as at the place of their origin, in some other localities, particularly in *natural* fruit soils—for there are such, preëminently so, in our country—while in other places equally favorable to their own local fruits, these we have mentioned, fail altogether. This important fact establishes the necessity of fully understanding what fruits will, and what will not flourish in the very spot where one is desirous to establish his plantation.

To one who does not know practically what he really wants, we advise him to consult some successful fruit-grower in his own immediate vicinity, and ascertain what good varieties flourish *surely*, and then to adopt them without further delay. Such should be the case for his main reliance. If he choose to experiment on others, untried as yet in his locality, he may adopt them sparingly, a specimen tree or two of each variety, but we would not advise a rash and indiscriminate planting of any thing at all doubtful. We have witnessed lamentable failures from the want of this very caution. A man who would plant an orchard of Newtown Pippins in Western New-York, would lose both his time and money, but with Baldwins or Spitzenburghs he might realize a fortune in time; while

the pomologist on the Hudson River could not plant any thing half so profitable as the Newtown Pippin, or Spitzenburgh, and discard the Baldwin altogether. So, in view of what has been remarked, it may be taken as a general rule by every planter, that *a local fruit, if it be what he wants, to the extent required, should be adopted in preference to any others*. This rule applies to pears, cherries, plums, &c., as fully as to apples, and some varieties of each might be named; but presuming that our readers have brains of their own, we wish not to spin out a tedious detail of what each will understand for himself, acting on the rule we have premised.

There is another thing which will be well to recollect in these days of *new* fruits, as well as new every-things. Very many of the new fruits which are imported across the water, with great names and high recommendations, let them have been truly valuable abroad, are worthless here. Some of them are adapted only to the localities whence they spring; others have been so "highly bred"—to use a term applied to animal instead of vegetable life—that they have neither constitution nor growth, the want of either of which would be fatal as profitable trees. All such had better remain in the hands of the importers, or nurserymen until their merits have been thoroughly tried, not at all fearing but that those we now have will serve us bountifully till their period of probation shall have passed.

We have much more at a future time to say in relation to fruits, which we intend to make a prominent branch of our labors; but for the moment, will content our readers with a brief catalogue of reliable varieties in their several kinds for general cultivation, requesting them, meantime, if either of them have proved unsuccessful in their own locality, to discard it, and adopt in its place such approved *local* variety as will answer their purpose.

APPLES.—*Early*.—Yellow Harvest, (sub-acid,) Large Yellow Bough, (sweet)—both of them sure, annual bearers, of moderate growth of wood, but hardy and prolific. The last fine for baking.

Early Autumn.—Golden Sweeting, Keswick Codlin, (sub-acid, for cooking,) constant bearers, and thrifty growers.

Later Autumn.—Cooper, Rambo, and Belmont, (the first for Southern and Central Ohio, the two last for Northern Ohio—all sub-acid,) Fall Pippin, Gravenstein, Jersey Sweet, Lyman's Pumpkin Sweet, (for baking, it will keep into winter also,) Porter—perhaps the very best pie-apple of the season, as it will cook both early and late, and Fameuse, Pomme De Neige, or Snow apple—for it goes by all three names—ripening late in the fall and keeping till January.

Winter.—Baldwin, Hubbardston Nonsuch, Newtown Pippin, (where it will grow,) Northern Spy, (in Western New-York,) Rhode Island Greening, Roxbury Russet, Poughkeepsie or English Russet, Swaar, (in Western New-York,) Westfield Seekno-further, Esopus Spitzenburgh, Talman Sweeting, (for baking, and it is equal to a sweetmeat when baked,) and Vandervere, (which we think the very highest flavored and richest apple known, where it will grow fair and perfect.)

PEARS.—*Early*.—Madelaine, (very early, but not a vigorous grower, or great bearer,) Blood-

good, (bear well every other year, and a good grower—we prefer this to the Madelaine, if we had but the one,) Bartlett, (succeeds the others, and the very best, large, early pear.) To these we will add Osband's Summer, a delicious and beautiful little pear of Western New-York, ripe just before the Bartlett.

Autumn.—Steven's Genesee, (succeeds the Bartlett,) a tree or two, with rich cultivation, of the Brown Beurre, (in perfection one of the richest and most delicious of pears,) White Doyenne, or Virgalieu, Gray Doyenne, or Gray Virgalieu, Louise Bonne de Jersey, and Seckle.

Winter.—Beurre D'Aremberg, Easter Beurre, (keeps till spring,) Glout Morceau, Winter Nellis, and St. Lawrence, (this last is a new Long Island pear, and has to be tested elsewhere.)

QUINCES.—The Orange is the best variety, and the only one we can recommend as really good, and always reliable.

APRICOTS.—Breda and Dubois' Golden, (the latter for its hardness and productiveness.)

CHERRIES.—Baumann's May, (very early,) Black Heart, (very vigorous growth, and prolific bearer,) Black Tartarian, Elton, Yellow Spanish, or Bigarreau, Elkhorn, May Duke, Late Duke, and the Common red, Kentish, or Pie Cherry, (really the best cooking cherry in its season that we have.)

NECTARINES.—Downton and Early Violet. (These are such very delicate fruits as hardly to be worth cultivation in most places.)

PEACHES.—These are so fluctuating in quality in various localities, that the *surest* way is to look about you and see the *best* that your neighbors have, if good, and copy after them. If your locality be well fitted for them, we recommend the Red and Yellow Rarierpes, Crawford's Early, and Late Melocotons, (coarse but large and showy,) George the Fourth, (very fine,) Royal Kensington, (delicious.)

PLUMS.—Bleeker's Gage, Frost Gage, (late, and fit for preserving only,) Green Gage, (the very best, but hard to propagate,) Lombard, (very prolific, and good market plums,) Smith's Orleans, Washington, and Yellow Gage. To these may be added some varieties of the common Blue, or Horse plum, which are very good for cooking.

CURRENTS.—The large Red, and White Dutch with good cultivation, are altogether the best, and answer all the requirements of the Currant tribe for edible or house-keeping use. The Black English Currant, however, makes a rich jelly, and is a grateful relish in cool drinks in sickness. We would always have it in the garden.

GOOSEBERRY.—These are hardly worth garden cultivation when we can cultivate the Rhubarb so freely for tarts; but if one is disposed to combat mildew, and its other enemies in this country, for the sake of so poor a fruit, we name the Swelling's Crown Bob, and White-Smith, as the best among the foreign, and Houghton's Seedling, an American variety.

RASPBERRIES.—The Red and Yellow Antwerps are the best of the finer kinds. Knevet's Giant is said to be somewhat harder.

STRAWBERRIES.—The variety of these is getting to be "legion." Almost every locality has its particular favorite. We would never be without the early Scarlet. It is always reliable, and the earliest of the season. To this we will add Hovey's Seedling, Burr's New-pine, and Rival

Hudson. But we frankly admit; although these are our favorites, there may be others quite as good—possibly better for some places.

The above-named fruits embrace almost every thing in common cultivation, except the grape; and where the climate will admit of their ripening in out-door culture, the Isabella and Catawba are altogether the best we have known. If the new Concord grape, noticed in our paper a few weeks since, succeeds, as we hope it will, it will prove a desideratum for northern cultivation, for at present we honestly confess, compared with the Isabella and Catawba, we do not know of a grape worth cultivating out of doors by their side.

After all we have now written, we earnestly advise those who are about to plant fruit trees, or having already planted, and without them, to provide themselves at once with the fruit treatises of either DOWNING, THOMAS, or BARRY—or all of them, and study their pages closely. The subject is too diffuse in its various details to be fully treated in a single article in any one periodical whatever.

Mr. ELLIOTT has a new work now passing through Mr. SAXTON's press, at 152 Fulton street, New-York. He informs us it will treat more fully on new varieties and the western fruits, than either of the above publications. Mr. ELLIOTT has been long a resident of Cleveland, Ohio, and has assiduously devoted several years to the study and practical cultivation of fruits.

THE PRESERVATION OF FRUITS.

THE unusual interest that is every where apparent at the present time on the subject of the preservation of fruit, is very appropriate, and suggests a topic for a brief practical article, especially as we have recently received several letters of inquiry on this subject from our subscribers.

Millions of dollars are annually lost to our country, and there is a deprivation of one of our choicest luxuries to the million, by the carelessness or ignorance that so generally prevails in regard to it. A little attention and knowledge of the simplest general principles would prolong the fruit-enjoying season to nearly double the present time. The following rules are alike applicable to the apple, pear, grapes, &c.:

Gather the fruit *just* before it becomes fully ripe, between the hours of 10 A. M. and 5 P. M., on a clear dry day, and remove all the unripe, bruised, and imperfect fruit. Place the fruit on the floor of a cool chamber from six to twelve inches deep, where it should remain to sweat for a week or ten days. If more convenient to hasten the sweating process, place a thin layer of clean straw over the fruit for a day or two. Then place the fruit in dry barrels or boxes which close tightly, and store in the coldest dry place that can be found free from frost. We have often preserved apples, pears, and grapes very well in layers of paper, cotton, &c.; but we are not sure they will not keep better, and their flavor be the better preserved without any thing around them. Cotton absorbs moisture and impairs the flavor.

A strict adherence to the above will doubtless largely contribute to the preservation of fruit and the excellence of its flavor.

The more perfect French method of preserv-

ing tender fruits for many months, consists in placing them in a house prepared for the purpose, by building a small room on a dry, well-drained soil. The walls are of clay or sun-burned brick, twelve inches in thickness, on the outside of which, leaving one foot space, another wall of the same description is built. The roof is of similar make, filled in with tan-bark, and the whole covered with a board roof for protection, after leaving a slight ventilation in the roof and small windows. The temperature of such a house, it is said, will remain nearly the same during all the variations of climate the year round, and preserve the most tender pears, peaches, and even the strawberry in the perfection of its flavor.

Another mode of preserving fruits, which is attracting much attention at the present time, is that of putting them in glass jars or cans, hermetically sealed, after the expulsion of air, by immersing them in boiling water for that purpose. We have attained the same object by extracting the air with a force pump.

Cherries, raspberries, blackberries, gooseberries, and currants may be preserved easily and in great perfection in this manner; but it is quite difficult to preserve the delicate flavor of the peach; and quite impossible, as far as our experiment and observation go, to preserve the strawberry in this way. This process requires great care and skill, and even then it sometimes fails in part to succeed.

The first plan we have described is the simplest, and for general use doubtless the best. In this way the Rhode Island Greening and Spitzenburgh can be retained in all their perfection until July; and the Northern Spy, Newtown Pippin, and Golden Russet, until September or later. If one-half of the winter fruit put up in the usual careless manner becomes worthless in flavor or rotten by the first of April, and the above process will remedy the evil, surely, it is well worthy of the little care and attention required.

CULTIVATION OF PEARS.

Mr. HOVEY has a long article on the cultivation of pears in his Magazine for March, in which the subject is discussed more particularly in reference to the difference in climate existing between America and Europe. Where the pear is most grown in the latter country, and whence we have derived our principal stocks, the climate is more equable and more humid than in the United States. Mr. HOVEY proposes obviating this difference of climate by "deep and thorough trenching of the soil, which will supply an abundance of moisture, and counteract these atmospheric influences; and whoever wishes to produce the larger and finer foreign pears must take this course."

We will add that *deep trenching* is highly beneficial to all other fruits, whether grown on trees, shrubs, or vines; and this should invariably be done before planting, unless the land has just been cleared of a forest, or is particularly rocky.

THE CRANBERRY.

THE interest in this valuable fruit has become so general, and the desire for information, now scattered and inaccessible to the majority of inquirers is so great, that particular attention has been given to the collection of all that can be

useful and valuable in regard to its natural history and cultivation. With this view, nearly a hundred acres of cultivated cranberries have been visited in different sections of the State.

The cranberry is too well known in New-England to need description; but, it is so short a time since attention has been called to its cultivation, that many questions connected with it may be regarded as still unsettled.

Its Natural History.—There are two prominent and well known species of this fruit; the small or European, (*Oxycoccus palustris*), and the common American cranberry, (*Oxycoccus macrocarpus*.) This plant was formerly classed as one of the whortleberry genus, (*Vaccinia*), but is now considered by many scientific men, as forming a group of four or five species, of which, the two mentioned above, are most commonly known.*

The roots of the small cranberry are creeping, with many stems, which are very slender, wiry and trailing, with many leafy branches. Its leaves are alternate, small perennial, somewhat oval, rolled back at the edges, erect on small stalks. They are glaucous, or of a grayish color underneath. The flowers are small drooping, and very beautiful; each consisting of four distinct petals rolled back at the base, of a deep flesh color, on simple red stalks, which have two or more very small, imperfectly developed leaves or bracts. The berries of this species are small, being about as large as an ordinary sized pea. In the early part of their growth, they are spotted, very much like a sparrow's egg, the spots being a little smaller, but, finally, in favorable situations, turn to a deep red. They have an acid taste, and are much used for tarts and jellies. It delights in marshy bogs covered with moss. It grows in great abundance in Russia, Sweden, Germany, and to some extent in Scotland and the north of England. It is also found in Nova Scotia and New Brunswick, and that vicinity, where it bears very abundantly, and along the St. John's River, to a great distance from its mouth. It is met with in some parts of Massachusetts also. I observed it in the swamps of Provincetown, where it is called the "spice cranberry." It is imported into England from Sweden and the north of Europe, in large quantities, and though with us it would be considered as far inferior to our common cranberry, it is more esteemed by many.

[*NOTE.—There is a plant called the High-bush, or High Cranberry, (*Viburnum opulus*), indigenous to North America, found on uplands in Maine, and along the St. John's River, and in some parts of Massachusetts. It is a beautiful shrub, sometimes ten or twelve feet high, having a white blossom, and a fruit somewhat smaller than the common cranberry, perfectly red, and of an acid taste, well adapted for tarts, pies, &c., for which it is often used. The fruit differs from the common cranberry, in having a small oblong stone instead of seeds. It is easily propagated by seeds, layers, or cuttings, and is often found as a garden shrub, flourishing in every variety of soil, sands and clays, wet and dry. Its berries grow in clusters and are persistent through the winter.

The plant, called in Maine, the "Mountain Cranberry," (*Vaccinium Vitis Idæa*), has leaves shaped like those of our common cranberry, and bears an acid fruit used for the same purposes as our cranberry. It is very rare in this State, and where known, is called the "Cow Berry."

There is still another plant, (*Arbutus, Uva-ursi*—L.) found in abundance on Cape Cod, and there called the "Hog Cranberry." This is the common Bearberry. It is not properly a variety of the cranberry, but belongs to a different genus. Its leaves, are in shape, much like those of the cranberry, and it is trailing like that plant. Its fruit is red, but smaller than the cranberry, and is used for medicinal purposes.

All these plants have come under my personal observation and study.]

In Sweden, it was formerly common to boil silver plate in the acid juice of this berry, that it might cat off the minute particles of copper alloy.

The common American cranberry is a native of North America. It grows and flourishes in mossy swamps and bogs, as well as on sandy soils, from high northern latitudes, to North Carolina on the south, and to Minnesota on the west, where it produces very abundantly every other year, and is not excelled in size or flavor by cranberries in any part of the country. It is bought in large quantities of the Indians.

The stem of this species is larger than that of the small cranberry just-described, and is commonly from a foot, to four or five feet in length. It is sometimes much longer than that. I have seen it from twelve to fifteen feet in length, throwing up many rising branches, sometimes to the height of eight or ten inches. The leaves are about one-half an inch long and nearly one-fourth of an inch broad, the second year, when full grown. On the new spring branches, which bear the flowers and berries, they are crowded towards the top. They are of an oblong, oval shape, the margin curved back, divided in the middle above and beneath by the costa, from which veins run to the margin. The flowers are frequently in pairs, very elegant, held towards the end of the new spring branches by erect, reddish stalks, much bent near the ends, giving them, together with the calix and flower-bud, before expanding, the appearance of a crane's neck, head and bill, whence it derives its name, craneberry or cranberry. The flowers continue to grow until immature berries are produced, on the stem in July, and in some instances, even into August. The berries are of a yellowish green before ripening, and when ripe, of a bright scarlet or carmine color, and in some varieties, nearly black, or light and speckled with deep red, varying in shape, from round to oval oblong, about one-half of an inch in diameter, of an agreeable acid taste, and often clinging to the vines during the whole winter. If gathered before ripe, they have not that delicious acid taste which they have at their maturity, and are, therefore, far less valuable than when left to ripen on the vines.

The cranberry grows naturally in watery bogs and morasses, and sometimes on high mountains. I have seen it growing luxuriantly and producing in abundance on marshes exposed to, and covered by high tides, on coarse sand, perfectly white and entirely destitute of organic matter of any kind, though accessible to moisture; on pure peat, on peat covered with sand, on dry, loamy and gravelly upland, and on the richest garden mould thoroughly tilled.

The American cranberry is exported very largely to Europe, though, as has been stated, it is not universally considered as equal to the Russian. It was found and used by the early settlers of Massachusetts, though not introduced into the Royal Botanic Garden, at Kew, till 1772, and comparatively little valued here, till within the last half century.

Analysis.—A valuable analysis of this fruit has recently been made, at my request, by Professor E. N. Horsford, of Cambridge. From this analysis it appears that the

Percentage of water expelled at 212° F., is	88.78
Percentage of ash,.....	17
Woody fibre, tissues, organic acids and other organic matter not decomposed at 212° F.,.....	11.05
	100.00
Percentage of potash in the ash,.....	42.67
" " soda,.....	1.77

This explains why this fruit flourishes so well on the sea-shore, where it derives its alkalies; the amount of potash, though small, may be derived from the sea.

From this analysis, it will be seen that only .17 per cent., or less than two-tenths of one per cent. of the cranberry is found in the ash, as inorganic matter, derived from the soil, all the

rest being derived from the atmosphere and from water. The results of experience are, therefore, strikingly corroborated by the deductions of science, that the cranberry will grow where nothing else will. It explains, too, how it is that this fruit seems to require nothing for its perfect development, but air and water, as will appear more distinctly hereafter.

Modes of Cultivation.—The cranberry may be propagated from the seed, or from cuttings, or by transplanting. The last method is most frequently adopted. The first crop obtained by planting the seed, will ordinarily be a year or two later, than that produced by wild plants transplanted. It is, therefore, found to be more profitable to transplant, except in one or two sections of the State, where the interest in transplanting has been so great, that ten dollars a square rod is not an uncommon price for plants, where the ground is thickly covered. When it is desired to propagate by slips or cuttings, the usual practice is to gather a large quantity of vines and run them through a common hay-cutter, till they are reduced to the length desired, an inch or so, when they may be sown broad-cast and harrowed in, though it is considered best, on some accounts, to sow in drills and cover properly. These slips very soon take root, starting from the base of the leaves, and at the same time shooting up many rising branches. If sown broad-cast and harrowed, they should not be overflowed till the slips have taken root, as otherwise, many, remaining uncovered, will be floated off.

In the case of cranberries growing wild, it is a common and well-known practice to flow or cover them with water during the winter and early spring. This is very desirable, if the situation is such as to allow it, though it is not generally considered as essential by those who have been most successful. It is often useful, where there are facilities for flowing, to let the water remain a few inches deep till the spring is well advanced, (some think, till the first of May, or even later,) to retard the blossoming till there is no danger from frosts. Facilities for flowing are desirable in cultivation of cranberries, also, and if the plantation could be so arranged as to flow very quickly, it might be of essential service, occasionally, during the spring or autumn.

As the cranberry, in its natural state, is more frequently found growing in a low wet swamp or marsh, that kind of land is generally selected for its cultivation.—*Report of Sec. of Massachusetts Board of Agriculture.*

(To be continued.)

LAKE ERIE GRAPES.

CHARLES CARPENTER, of Kelley's Island, in Lake Erie, off Sandusky Bay, gives an account of some very successful experiments in grape culture on that island. He says:

The soil of Kelley's Island consists of a few inches of vegetable mould, resting on a sub-soil of hard clay, in which is mixed some pebbles and sand, mostly of lime-stone, and occasionally crystals of sulphuret of iron are found.

When the whole are mixed by plowing, they make a pretty stiff soil, well supplied with lime, sulphur, and iron, and yield heavy crops of wheat or corn. Most of the island is nearly level, or having a gentle slope, just sufficient to carry off the surface water.

Where grape vines are planted, the ground is sub-soiled eighteen inches deep, and under-drained. The first planting of grapes was in 1842 or '43, when a few Isabellas were planted in gardens. The Catawba was introduced two or three years later. The unusual growth of the vine, and superior quality of fruit, attracted the attention of persons acquainted with their culture, and generally elicited expressions of surprise; and induced several persons to engage in the culture for the sale of fruit and wine-making.

In the spring of 1851, the writer set part of a field where corn or wheat had been raised for five successive years. The ground sub-soiled

and under-dained. Layers and cuttings, each one year old were used. In February, 1852, the growth was cut down to two and four inches from the ground.

From one to four shoots were allowed to grow, according to the strength of the plant. The side shoots were picked off twice in the early part of the season, in all from three to five feet from the root, after which all were allowed to grow. In November some of the Isabellas had two shoots each eighteen feet long; others four shoots each fourteen feet long.

Some of the Catawba have two, others four shoots ten feet long each, of wood well ripened nearly to the ends. No manure of any kind has ever been put on this field, except some leached ashes on one corner, and that does not appear to have increased the growth at all.

The yield of fruit has been uniformly heavy until the vines were injured by the severe winter of 1851-'52, and again by long-continued and heavy rains while in blossom.

Mildew is sometimes seen on the Isabella, but never yet on the Catawba. The rot I have never seen but once.

The training here is entirely on trellis, some made of wood, and some of wire. That of wire is made thus: Set posts twenty-five feet apart, bore half-inch holes at suitable distances; if for three wires, say twenty, forty, and sixty inches from the ground; or if for four wires, at eighteen, thirty-two, forty-six, and sixty do. Then draw in annealed wire, number nine, the whole length of the row of posts, letting the end come through the last post about four inches, drive in a half-inch pin of hard wood from the outside, and give the end of the wire one turn round the pin close to the post. Then from the other end draw the wire tight and fasten as before. The end posts should be set firm, with a brace from the inside.

Number nine annealed wire is seven cents per pound, and weighs just one pound per lineal rod. Wire trellis is put up very rapidly, and costs less than half that of wood.

It is better, also, for the clusters can hang singly, and have full benefit of the air.

A little wine has been made for the last three years—has been pronounced by good judges to be of the first quality.

Grapes will keep until May or June without decaying. I once put a bushel in a basket, covered with a sheet of paper, and set the basket in the cellar, on a barrel of apples. In March they were sound and fresh, and in better condition than the russet apples.

The influence of the Lake has a marked effect on our vegetation, retarding it in the spring, and preventing late frosts. In sixty years that peaches have been growing here, they have never been injured by a spring frost.

In the fall the water retains the warmth acquired during the summer, sufficient to extend our season considerably beyond that of the main land at a distance from the lake. We never have a frost before the 20th of October, and often not until much later. The first this season to do injury, was November 13th, when the thermometer fell to twenty-eight degrees, until which time peppers, tomatoes, and the like, were untouched. A trifle of white frost had been observed before in some localities, but not sufficient to do injury.

The severe drouths of summer are considerably mitigated by the moisture arising from the lake, while at the same time, fogs, so destructive to the grape leaves, are of rare occurrence in summer or autumn.—*Tribune*.

GRAPES.

THE improvement of the grape, with a view of obtaining varieties adapted to our climate, has been of late, as has already been stated, sedulously pursued by the raising of seedlings, and new varieties have been, and will probably continue to be, annually exhibited. In endeavors for this object Mr. A. W. Stetson has distinguished himself, and during the past season

he exhibited several new seedling varieties among others the following:

Seedling No. 1, from the Grizzly Frontignan, of a purple color; both bunches and berries of good size and fine flavor. This grape was highly approved of by good judges, and will, Mr. Stetson thinks, prove to be hardy.

Seedling No. 2 is from the Grizzly Frontignan, has berries nearly white, with a little tinge of bluish.

Seedling No. 3, also from Grizzly Frontignan; resembles No. 2, but has larger berries.

Seedling No. 4 is from the Black Hamburg; three years only from the seed.

Seedling No. 5, a seedling from the Sweetwater; exactly like the common Sweetwater, in every thing but color, which was a dark blue.

In addition to the foregoing, Mr. Stetson fruited the past year many other seedling grapes. Mr. James Blood, of Newburyport, has two seedling grapes, which he states have been in bearing eight years, and never failed to produce a crop. The fruit was ripe this year in the last week of August. One of these was a large purple grape, resembling the Isabella; the other in color, more approximating to the Catawba. They seemed to be both good grapes, and from the circumstance of ripening so early in the season, in addition to their other qualities, may prove an acquisition.—*Hovey's Magazine*.

THE STRAWBERRY.—The sexual character of the strawberry is the subject of a very interesting report just made to the Cincinnati Horticultural Society by a committee, who have come to the following conclusions:

1st. That all strawberries, in their natural state, have some blossoms, perfect in what are termed male and female organs, while some are decidedly pistillate, and others staminate.

2d. That when they are in some degree perfect in both organs, the fruit will be small and indifferent, except, perhaps, in the case of "Longworth's Prolific."

3d. That if the staminate plants prevail, there will be but little fruit realized.

4th. That if they be all pistillate there will be a like result, and that of an inferior quality.

5th. That to insure a full crop, whatever be the theory, it is absolutely necessary that the pistillate plants predominate; indeed, that the staminate plants be very sparsely distributed.

For the American Agriculturist.

A NEW REMEDY FOR CURCULIO.

I HAVE in my yard two plum trees, which have blossomed well every spring for more than ten years past, and have been, literally, loaded with young fruit; but not one solitary plum escaped the ravages of the curculio long enough to mature, until last summer when one of the trees produced a fair crop. These trees stand about two rods asunder; and their circumstances, as to soil, exposure, and situation in reference to other trees, are as nearly alike as may be. During the past ten years I have tried every thing—except "catching the crittur"—which I have seen recommended in agricultural works for repelling the curculio, but found nothing effectual until last season. I yarded my pigs in a small space about them for several weeks, to no good purpose. They were dusted with lime and ashes every morning for a long time without success. Holes bored into the body of the tree, and filled with sulphur, and stopped with a plug, had no perceptible influence. Many other remedies proved quite as ineffectual.

But last spring, early in May, in grading my yard around one of these trees, to the depth of ten to twelve inches, coarse unfriable earth from the highway side was drawn in with a seraper, and the team in traveling over it, packed it down very firmly. I had resolved, that if I found no fruit this year, I would cut them down. The result was, that the tree which had dirt hauled about it yielded a fair crop of ripe fruit;

while from the other one, although it was well filled with young fruit, every plum dropped before they were half grown. I observed when the curculio was committing depredations, and the fruit was dropping daily, that from the tree, around which dirt had been drawn, but very few plums fell to the ground in consequence of having been stung.

It would appear, from this fact, that the curculio itinerates but little; that it hibernates in the soil, under the branches of the trees, on which it has flourished the preceding summer; and that paving, or burying it in the soil, a few inches deeper than it is accustomed to burrow, delays its resurrection, until the young fruit has grown so as not to be injured by these little marauders.

I design to make some experiments this season in repelling the curculio; and if I am successful, I will furnish you with details respecting them, and the result. S. EDWARDS TODD.

Lake Ridge, Tomp's Co., N. Y.

Similar experiments to the above have come under our own observation, but no covering of the surface of the ground has yet proved entirely effectual. Mr. MANICE, of Long Island, paved the ground under his plum trees, but did not entirely succeed in keeping out the depredators till he entirely surrounded them with a high board fence. Against this the curculios would strike in great numbers while attempting to reach the trees.

THE BEST CELERY.

THE few remarks I have to make on this subject, therefore, are not made with a view to describe any particular mode of culture, but rather to direct attention to particular varieties now in cultivation. There are at the present time a great many kinds of Celery grown, and all have their patrons, or some of them would soon become extinct; and if each cultivator, after a careful trial of the comparative merits of each variety, has retained the best and most useful for his purposes, he is quite right in doing so, and may assist others by giving the public the benefit of his experience; which I shall now proceed to do, trusting that others in different parts of the country may be induced to do the same.

First, then, it is an indispensable quality in celery that it should be solid; second, that it should be sweet and crisp; and third, that it should remain long in perfection. The only varieties which I have found to possess these qualities any thing like constant is one known in this neighborhood under the name of "Dwarf, late White Celery." Unfortunately it has never been made known by the trade; at least, if it has, it has been so but very partially. It is of a dwarf, robust, compact habit, and can be had good ten months out of the twelve; the space between the rows may also be eighteen inches less than that for any other variety. I should advise all who have not grown it to give it a trial; and I am certain of its giving them satisfaction. It can only be had true from a few establishments at present. Those who have a stock of it should, therefore, make it known; for of all others it is certainly the Celery best calculated to meet the extensive demand of a gentleman's establishment, and to give entire satisfaction as regards flavor. A BOUSIE.

Stoke Park, near Slough.

[We can confirm Mr. Bousie's opinion from our own experience. We find that those who have once grown it care but little for any other variety. It is most desirable that it should have some distinctive name; and we suggest that in future it be called "Incomparable." The raiser of this very useful variety is unknown.]—*Florist and Fruitist*.

POVERTY wants some, luxury many, and avarice all things

American Agriculturist.

New-York, Wednesday, March 15, 1854.

OUR PAPER.

We are not fond of boasting, but we do feel a high degree of satisfaction—not to say pride—in presenting to our numerous readers such a paper as we now send out. We will not enumerate them, but ask our readers to look over and look through the long list of articles in this number, most of which it will be noticed are original; and we hope to make each future number if possible an improvement upon its predecessor.

We may be allowed to say in this connection, that whatever appears in the *Agriculturist* as editorial, or with editorial sanction, we shall honestly endeavor to make strictly reliable. We rather pride ourselves upon excelling in this particular, from the fact that those who speak through our editorial columns, are men deeply versed in both the *principles* and *practice* of agriculture.

We are happy to announce that in addition to our former force, we have enlisted in the editorial corps, the services of Mr. LEWIS F. ALLEN, so long eminent in the western part of this State as a Farmer, Stock-Breeder, and Fruit-Grower. Mr. ALLEN occupies a farm of about one thousand acres, near Buffalo, and has large herds of improved cattle, fine flocks of sheep, and over forty acres of orcharding. With what ability he instructs others with the pen, is shown by several articles on orchards and other departments of the farm, in the last volume, as well as by the article on "Fruits and their Varieties" in the present number.

We also take great pleasure in saying that Mr. R. G. PARDEE—whose valuable contributions to the various Agricultural and Horticultural journals for several years past, have made him widely and favorably known—is now enrolled with the editors of this journal. He will attend more particularly to the Horticultural Department, and hereafter give what he has to say on this and kindred subjects, to the *Agriculturist*.

Several other gentlemen, who are thoroughly practical farmers, as well as able writers, have promised us their constant aid in our effort to make the *Agriculturist* preëminently the leading, as well as most instructive and reliable work of its kind in the country.

With these appliances and efforts on our part, may we not again request each of our present readers to make a personal effort to enlarge our circulation; not only that an increased income may enable the publishers to add to our present facilities, but also to extend to as wide a circle as possible, the advantages which must result to those who weekly read a large and reliable agricultural journal.

Who will respond to this request, by sending one, two or more new subscribers, among their immediate friends and acquaintances?

We take the liberty of sending this number, as a specimen, to some intelligent agriculturists, who are not subscribers, (and to the very few who have been subscribers but who failed to

renew when their time expired.) We trust that all who are disposed to forward our enterprise, and at the same time benefit themselves, will promptly remit the small sum required for a year or for six months' subscription. There are in each year two complete volumes with an index, and we are quite willing to receive new subscribers for six months, that they may try us.

We renew the request made in a former number, viz., that our subscribers will send us the address of their friends and acquaintances, to whom they may desire to send a copy of the paper, and specimens will be freely mailed to them from the office without expense.

TO OUR LADY READERS.—We are so crowded with original matter on other subjects this week, that we have neglected the *Household Department*, though some good suggestions will be found in the *Reminiscences of a Farmer's Daughter*. We design to devote considerable space each week, to giving information on matters relating to the *in-door* work of the farm. We have a basket full of Recipes which we might publish, but we are unwilling to insert any thing of this kind, which we do not know to be useful, or which is not directly vouched for by some person speaking from experience. We respectfully request the ladies to communicate any information in regard to household matters, which may be useful to others. Their names need not appear in the paper if they desire them not to be there, though it adds interest and value to any communication to have it signed by the name of the writer. Every valuable hint thrown out through our columns, is read by, and benefits thousands.

We just now call to mind the "Washing Recipe No 2," on page 279 of last volume, in which the use of borax is recommended. Indirectly, we have heard of it being tried, and highly approved. Will some of those who have tried it faithfully, communicate the results directly to us. We are just as anxious to learn the fact that an experiment has failed, as that it has succeeded, for such information is equally important to others.

ACKNOWLEDGMENTS.—We have just received, through the politeness of Mr. D. A. BULKELEY, a copy of the address of JUSTUS TOWERS, Esq., and the reports of committees, &c., at the Forty-third Anniversary of the Berkshire County (Mass.) Agricultural Society.

We have also received a copy of the addresses at the annual meeting of the New-York State Agricultural Society, by the retiring President, LEWIS G. MORRIS, Esq., and by the President elect, WM. KELLEY, Esq.

ERROR IN CREDIT.—In No. 25, Vol. xi., we inserted a short extract on Poultry Raising, which we found in an exchange *uncredited*. This article first appeared in the *Farm Journal*, of Pa., and should be credited to that paper.

HARPERS' MAGAZINE.—We have received the March number of this elegant magazine, in which the Messrs. Harpers make another "apology" on account of its appearance. We have no doubt that the new type, embellishments, &c., which they have been preparing for it since their great loss by fire last December, will surpass any thing yet got up in the magazine line;

but as for an "apology," why the public ought to *apologize* to them for the generous and elegant banquet they already furnish at so low a price. Gentle reader only think of this March No. now before us, containing 144 handsome pages, double columns, of the most agreeable and entertaining matter, illustrated by 52 fine engravings, and all for 25 cents. "Apology," gentlemen, it needs no such thing, especially from you.

Our readers will see under the head of "Economic Arrangements," &c., on the last page, that we offer them the above excellent magazine and our own for the low price of \$4 a year. Who will not have *Harpers' New Monthly* and the *Agriculturist*?

REMEDY FOR LICE ON HORSES.

A CORRESPONDENT at Milan, N. Y., asks for a remedy for lice on horses and colts.

Scotch snuff, well rubbed in between the hair and mane, is the best remedy we have seen applied. Some use a strong decoction of tobacco, others mercurial ointment. The latter is very dangerous, owing to the habit of colts biting each other. They are consequently very likely to get the ointment into their mouths and swallow some of it. This produces excessive salivation, and frequently death.

We have raised many colts but were never troubled with lice on them. They must be kept clear of hens and hen-roosts, and all other places where vermin are likely to harbor. If well fed then and cleaned, there is no danger of their getting lousy.

As soon as warm weather comes, we advise our correspondent to wash his colts well, two or three times a week, in mild, warm soap-suds, and continue the snuff till the lice disappear. In the meanwhile see that they are well fed, and have a clean dry place to lie in.

GUANO FOR CORN.

A CORRESPONDENT from Norwalk, Ct., asks the best method of applying guano to corn.

Sow broad-cast in the fall of the year, and plow in the guano as deep as you please. Cross plow equally deep in the spring, and then plant. Of course the time has passed for doing this for the coming crop. The only safe way now, is to wait till the corn is up, in May or June, then mix the guano half and half with plaster of Paris, charcoal dust, or fine soil, and at the first time hoeing, apply two table-spoonsful of the mixture round the corn, about four inches from the stalks, and dig it in lightly with the spoon. If this can be done just before a rain it will be better. Careful boys or girls will do this very rapidly. As the corn is near silking, apply another table-spoonful of the same mixture around each hill, about nine inches from the stalks. This will make it ear much better, and give a larger quantity and finer quality of grain.

Guano is a very strong, burning manure. If plowed or harrowed in, just previous to planting, the slightest particle—even not much larger than a pin's head—which comes in contact with the finest roots of the corn, is liable to kill it; but by plowing it in during fall, it has time during the winter to mix well with the soil, which imbibes its strong, burning principle—the ammonia—and then there is no danger of its

injuring the crop. Perhaps if the guano were plowed in during March, six weeks or so previous to re-plowing and planting, the ammonia from it would be so well mixed with the soil as to prevent danger to the corn.

CIRCULAR SAWING MACHINE FOR SAWING LOGS.

We have frequent inquiries about a circular saw-mill for cutting boards from logs. The following information, furnished by a correspondent of one of the best machines we know of, will doubtless be acceptable to many of our readers.

"It is a circular saw board machine, with two head blocks, twenty-four feet carriage and forty-eight inch diameter saw, will weigh about two tons, and costs from \$450 to \$550, according to its mode of construction. It requires steam or water to drive it, of about 12 or 15 horse-power. This machine has a number of new and valuable improvements, and it is giving entire satisfaction for cutting lumber as there is but little waste. Logs can be sawn from 5 to 24 inches diameter. With small logs they cut from six to eight thousand between sun and sun. One machine, with a good head of water, and a choice selection of pine logs, (just for an experiment to see what could be done in driving the machine to its utmost capacity,) sawed 1200 feet in one hour by the watch, but this is not a fair average of what it will ordinarily do. Very small logs of course would require more time in getting them on and off, than larger ones containing an equal quantity of lumber."

For the American Agriculturist.

CAN BONES BE DISSOLVED IN ASHES?

THERE seems to be little danger that farmers will not be sufficiently urged to collect bones for manure, as nearly every paper that has an agricultural column, appears to be calling their attention to the subject; but it is important, not only that the bones be saved, but used to the best advantage after they are saved. I notice a paragraph "going the rounds," stating that bones may be dissolved by making them into a heap with fresh ashes, moderately wet, and allowing them to remain a month or two. Now I have not tried this, but am very much inclined to doubt the efficacy of wet ashes as a solvent for bones, even though they remained in it a much longer time than a month or two. Will you be so good as to favor your readers with your opinion, whether this is one of the many worthless recipes that float through the newspapers, without any pains being taken to ascertain their origin or value, or whether it is reliable? If reliable, bones might be dissolved by this process much cheaper and easier than by the use of sulphuric acid. H. S. V.

We cannot now put our hands upon the paragraph alluded to. There are so many recipes for this and that, "going the rounds," which are entirely worthless, that we despair of correcting them, and generally let them pass unnoticed. It is really amusing to see many persons writing on chemistry, who have not the least practical knowledge of this science. We think there would be a hundred times less written on the chemistry of farming, if many of the editors of agricultural papers knew a hundred times more about it than they now do.

Bones are composed of two distinct parts, a fleshy (organic) and an earthy (inorganic.) Burn a bone, and you destroy its organic (fleshy) part, and leave a white mass—chiefly phosphate

of lime—which retains nearly the form of the original bone. Caustic alkalies (caustic means burning) will in like manner destroy the organic part, and at the same time render the earthy part a little more brittle than burning, if the alkali is strong. But it is out of the question that a mass of moist ashes, containing at most but a small per centage of alkali, (potash,) should dissolve the whole bone. A correspondent writes us, this week, that he reduced bones to a powder, by boiling them in strong ley for four hours. We think he must have kept them stirring during most of the time, or they would not have become powdered.

We know of no dissolving process equal to using sulphuric acid (oil of vitriol) where this can be obtained easily and cheaply, for most soils that need bone earth, seem to be benefited by the acid. To dissolve unground bones well, several months time is often needed. If they are ground, a few days at most is required. If they are first boiled in strong ley, so as to destroy the animal matter, the solution will be quite rapid. Where the acid cannot be obtained, it might be well to boil the bones in ley, or in water containing a large amount of ashes, for, in this way, the animal matter would be retained in a soapy form instead of being burned away, and the bones being made brittle, they could easily be crushed, and the whole mass be thus spread upon the land, after being mixed with muck, peat, &c.

HEAVY SPADE vs. LIGHT FORK.

DICKENS, in *Household Words*, gives an account of a trial of the comparative merit of these two implements at an agricultural gathering at Tiptree, the seat and farm of Mr. Mechi. The spade used was the ordinary farm spade, while the fork was two pounds lighter than the ordinary agricultural fork. It was ascertained that the fork would dig up easily hard strong ground that the spade could not efficiently do. The prongs of the light fork yield place to the stones and bend round them, loosening the soil and springing instantly when withdrawn into their original form.

A trial was also had between the light fork and the ordinary rigid and broad-bladed fork. "The man with the light fork earned four shillings while the other was earning two shillings and three pence, and the heavy fork after the match, required an outlay of sixpence for repairs. The savings in repairs and renovation, pay for the light fork several times in the course of the year, and in the labor the saving is so great that the man using this fork is said to lift—by the saving of two pounds in each effort—five tons less in the course of a day's work than his old-fashioned neighbor. It was ascertained by repeated trial that laborers with the light fork were able to perform their work more thoroughly with a saving of twenty per cent. of labor. These forks were composed of five narrow prongs of cast-steel, completed in one solid joint without joint or weld."

We believe Mr. HENRY PARTRIDGE, formerly of Sherburne, now of Medfield, Mass., was the first person who made the elastic hay and manure or spade fork, from a single piece of cast-steel; and that the English and other nations are the copyists of his invention.

Mr. P. first made the elastic cast-steel hay fork, "completed in one solid joint without joint or weld," in 1813. One of these was then purchased by a neighboring farmer, who used it every season till his death in 1851—thirty-eight years! It was still a good fork, and was

then sold at auction with the other implements belonging to the estate.

In the year 1815, Mr P. commenced the manufacture of the elastic steel manure and spade fork, of four to eight tines, from one solid piece of cast steel as above, and these he continues to manufacture to the present day. His son, Mr. HENRY PARTRIDGE, Junr., is also engaged in their manufacture, and has become quite as eminent in the business as his excellent father.

Forks for handling tan and oysters are made the same as the above with ten to fourteen tines.

Mr. PARTRIDGE has greatly improved the small trip hammer and its movements; and has exercised his ingenuity in improving many other things connected with his manufacturing business.

In the above trial spoken of in *Dickens' Household Words*, it seems the cast-steel fork did the same labor, at an expense of five tons less lifting in a single day. What a boon this is to the laboring man; and for this he may thank the mechanical ingenuity of our worthy countryman, Mr. HENRY PARTRIDGE.

A NEW DESCRIPTIVE HEN'S-NEST.

UNDER this head, our venerable friend, the *Knickerbocker*, says in its March number that, he finds the following in a Southern journal:

This is one of the most ingenious contrivances of the age, and is the invention of a downeast Yankee. The design is to deceive poultry into the speedy and liberal laying of eggs, which is accomplished by the peculiar construction of the machine. At the bottom of the nest there is a trap-door, which works on a hinge, being supported by a spring. The moment an egg is placed on this, the trap opens and lets it fall through into a cushioned apartment prepared for its reception. The consequence is, that the bird, just as she is preparing to cackle, glances at the nest, and seeing nothing, actually reasons herself into the belief that she has not laid at all, and resumes her position on the nest, in hopes of making a more successful effort. On the first trial of this curious contrivance before the Commissioner of Patents, to test its virtues, a singular result was effected. A large imported Russian hen was "located" on the nest, and left to her meditations. On account of pressing business, the hen was forgotten until the next day, when, to the utter astonishment of the commissioner, a half-bushel of eggs was found in the cushioned chamber below.

The *Knickerbocker* then goes on to intimate that the above Southern paper has been infringing on his own patent, long before obtained for the "*Self-Acting Hen-Persuader*." We should be glad if our fun-loving neighbor would give us the exact date of the caveat for the said patent, for we too have a "claim" of an invention to register; but whether it is as great an antique as that of our venerable contemporary, we shall leave him to determine. Suffice it to say, that upwards of six years ago, in the seventh volume of our journal, a grave contributor of ours, in his veritable history of "Yankee Farming," thus causes one of his heroines to speak:

"Du tell, Sargeant, now," interrupted the impatient Mrs. Doolittle, "have you hearn any thing about that 'ere patent hen's nest, way down to Inventionville, that keeps the hens layin' all the time? We haven't had a egg all winter, and I am dreadful fearful we shan't get one for settin' in the spring. Mr. Doolittle says he don't believe a word on 't; but I do, every bit; for I see it in the almanac; and the way was, as soon as the hen had laid the egg, it rolled down through a little trap-door into a

basket, when the hen looking under her could'n't find nothin' there, so concludin' she'd made a mistake and hadn't laid, she begun agin, and so kept on layin' as many as three or four a day, sometimes. He only asks five dollars for his patent; and sartin true, if I had one now, I could sell eggs enough before settin' time, to buy Molly a braun new silk frock, though she hardly deserves one."

Written for the American Agriculturist.

REMINISCENCES OF A FARMER'S DAUGHTER.

No. III.

BY MINNIE MYRTLE.

THE old farm-house on the hill, how well I remember it, for I am a genuine farmer's daughter as I told you, and "my experience" is not at all an imaginary one. We lived away out of the village, were surrounded by farm-houses, and our only neighbors were farmers, therefore I have a right to say I know something about them, and how they live. But I cannot say they were all to my taste, or that they all had the refinement and cultivation which I think it should be the aim of every class of people to possess; yet I do know that in more than one family, there grew up sons and daughters, with all the strength of character which is the pride of our country; and not only with refinement, but elegance of manners such as I have rarely seen surpassed in any circle in city or country.

It was in my earliest childhood that I used to see it, the old farm-house, but I should never forget, were I to live a thousand years, the lady who presided there; her gentleness, her dignity, her loving-kindness, and her lady-like deportment—which would be called in courtly circles high-bred. I remember how sweetly she reproved little children if they were rude, so indelibly impressing upon their minds the importance of politeness even in their play, and the possibility of uniting freedom and joyousness with gentleness, that I do not think any who were brought within the sphere of her influence could fail to be nobler and better all the way through life.

She was one of those women whose "price is above rubies;" who "saw well to the ways of her household;" and emphatically exemplified that the better educated and more highly cultivated a woman is, the better she is fitted for all the duties of wife, and mother, and house-keeper. There is no more false and injurious notion, than that education is only necessary for those who are to depend upon it for the means of livelihood. We hear it often remarked of a son, "He is to be a farmer or mechanic, and therefore may leave school early, as 'learning' is not necessary to his success;" and of a daughter, "She is to be married, and aspires no higher than to be a farmer's or a mechanic's wife, and therefore can do without book-knowledge." Yet it is true that if a man is to plant corn, mow grass, and "fodder cattle" all his life, he can do it better, and be happier whilst doing it, if he has learned to do it scientifically, and has abundance of food for thought while so employed. I could bring a thousand instances to prove that the most cultivated women are the best house-keepers; for no woman can be a thoroughly good house-keeper who is not systematic; no woman can sweep and dust a room well who does not do it systematically—or "do

a baking," or a washing, or practise economy; and the more thorough her education, the better she will be able to plan; and the more pleasant things she has to think about, the happier she will be at her toil; and thus more expertly and satisfactorily will it be performed.

The most intelligent woman I ever met, was one whose whole life was spent in the most severe and wearing toil; and never any where else did I see a house in such "apple-pie order," or eat such delicious bread, or meats cooked in such perfection, and all the economy and arrangements of house-keeping so thoroughly performed. There was never a day, even during "butchering week," or "soap-making," that she did not find, or make time to read, at least a page; and neither souse, nor sausages, nor soap, ever suffered on account of her love of reading.

But I must not forget the old farm-house and its presiding genius. It has become a proverb that the women of farmers' households lead a more toilsome and drudgery kind of life than the men, and I think this is true. One reason has ever been, that so little attention has been paid to convenience in the construction of those parts of the house where they must spend most of their time, and where their labor must be performed; and another is that the husbands and fathers have so little idea of the true nature of woman's toil. It seems to them *light work* to run round a cooking-stove, and sweep, and dust, and take care of children, while on the contrary it is infinitely more exhausting to mind and body than the labor of the field. Many and many a farmer do I know, who thinks his wife may perform all the labor of the household—the cooking, cleaning, butter making, and cheese pressing—which obliges her to rise early and sit up late, and never rest, and all because it costs so much to "hire a girl." But I could never see why it is not as reasonable to expect one man to do all the sowing, planting and plowing, the mowing, reaping or threshing, because it costs half the products of the farm to pay the "hired men." I suppose they would answer that the seeds would not be in the ground in season to spring up and bear fruit, and the grass would never become hay, and the grain would be spoiled before it could be cradled by one person. This is unanswerable: but because the wife does not spoil and become utterly useless in one season, it is not the less certain that she does spoil by such usage; and the children are spoiled, in the first place by her over-working when she needs rest and the kindest attention, and in the next place by neglect, because the mother has not time to devote to them. They are cross and fretful, when a little attention to their physical health and habits would keep them always well and pleasant.

Now the quiet, dignified lady in the old farm-house, was just such a farmer's wife. The house was an old castle of a thing, very well for some lord or duke who could afford to keep a train of servants, but not at all suited to the wants of a republican family in a republican land, where republican tastes should prevail, whether they do or not? The china closet was in the parlor, according to the custom in a multitude of just such houses that I have seen, for what reason I never could divine, unless because all the *best things* must of course be in the parlor, and to reach it from the kitchen, one

must go at least a Sabbath day's journey. The dining-room was half way between; the milk-room down cellar, and the cheese-room out doors! To prepare one meal, a woman must necessarily walk miles, and to do the work of a day was worse than a pedestrian tour to Mexico. I will tell you some day how she did it, and what was the secret of her success.

Miscellaneous.

For the American Agriculturist.

TRAINING CHILDREN.

I NOTICE what is said in the *Agriculturist*, No. 24, page 375, headed "Children of 1854."

If there be any one thing more interesting than another, it is children, beginning with the wee ones at the mother's breast up to the group in the play-grounds around the country villa or cottage. Surely that man or woman is not far removed from the brute who does not love children when well trained and taught obedience, and I can subscribe to Aunt Fanny's creed, and add to it many more articles.

But here lies the great cause of the many evils which befall the children of the present day, viz., the want of parental government. Children are not taught obedience. There is no lack of commands or demands, neither of which are enforced, but they are allowed to disobey them with impunity, and to have their own way and carry their own points in almost every thing, either by teasing, open rebellion, or stealth; hence they become a pest and vexation in our public conveyances, our boarding-houses, and more especially in our schools; for children who are not taught obedience at home, will seldom when abroad submit to rule, however simple and reasonable. On this account both parents and children who do their duty, have to suffer by the neglect of those who do not. Can any one point out a remedy for this growing evil before it be too late?

ALMOST AN OCTOGENARIAN.

ANY BODY'S CHILD.

THE following story by DICKENS, is as true of thousands of children in the city of New York, as in London. It behoves the public to take care of them; and we may be assured if the State schools do not educate the wild urchins, roaming about without house or home, and belonging to any and no body, the State prisons will. The rich had much better be taxed for the proper education of poor, ignorant children, than for their support in prisons, and the expense of a large police force, criminal lawyers, and judges. Some of the ideas in this story of DICKENS, are the same as those in the communication in our last week's paper by "Almost an Octogenarian;" but we know the writer of that had not seen this, when he wrote his article.

Any body's child is a sad little being. You find him playing at marbles in a city alley. His feet are bare, his clothes are ragged, his voice is hard and cracked, his hair is matted down over his eyes, his hands are thin and angular, his knees protrude through his torn trousers, and those rags are kept on by a piece of cord that passes over his shoulder. How keen are the eyes that leer out at you from under that hair-thatched brow! They read

you off in a minute. Any body's child can tell, at a glance of those sharp eyes, whether you have any thing or nothing in your pocket; whether your heart is hard or soft; whether you are a parish officer or a detective policeman. You may deceive casual observers, but Any body's child is not to be done. Admitted.

He has no respect for you; if you freely offer him money, you are a flat; he has a ready impertinence to throw at you should you be harsh to him; he hates you if you be either a parish officer or a detective. If you be a philanthropist he listens to you only to laugh at you. Any body's child is twelve years old, yet he has had great experience in the world. He is skilled in every artifice, and ready to profit by any. Admitted.

Is it his cue to be penitent, to repent thoroughly, to cry, and call himself an abandoned wretch and a miserable sinner, to declare that there is no good in him, that death is the best possible thing that could happen to him, to exhibit a knowledge of religious observances—he will do all this, you know he will. Admitted.

First, he cries; then he allows himself to be soothed; then he describes the terrible hardships he has suffered; then he strikes up a psalm, which he sings very fairly. This performance is well adapted to touch the feelings and to influence the pockets of the good ladies who go their rounds courageously, about the worst by-ways of the city, doing what they conceive to be their duty, quietly and firmly; distributing, with real charity of heart—but often to unworthy objects—money which they can ill spare. Any body's child knows these good ladies very well. He hears what they have to say with downcast eyes; and he is very serious when he takes the tracts they are so good as to distribute. But how can he read while he is hungry? The lady is certainly to be touched by this appeal, and all honor to her gentle heart! Any body's child receives sixpence. Then the lady proceeds to the next court, and Any body's child buys some pudding at a house close at hand—which he wraps up in the tract—and saves twopence for the low theatre at night. You know all that is true of Any body's child. Admitted.

Any body's child plays other parts. Many come to inquire into his condition; to ask him about his parentage, his mode of life, the number of times he has been in prison, the games he has played. To these he appears very hardened indeed. He has no recollection of his mother, and his father is somewhere in the country. He is allowed to sleep upon a pallet in the corner of a kind old woman's kitchen up a court. He lives by all sorts of stratagems. He holds gentlemen's horses; he goes out with costermongers to cry their wares. He has been offered the situation of errand-boy, to carry out goods; but he never liked it; such places was always too hard for him. He has been in prison many times, five or six times at least. He proceeds to repeat the prison regulations, for he knows them by heart. He has been engaged with other boys in taking lead from house-roofs; in "snow gathering," (a poetic expression for clothes stealing from hedges,) in picking pockets at fairs. He can turn his hand to any thing destructive; but finds the world is again him. He knows very well that he is an outcast, and that boys of his sort are not to be admitted into any decent companionship. Yet his is a hard life—his is. He has tried very often to do something for himself—he has; but it ain't of no use, he can't keep to nothing; he gets tired of it, and people gets tired of him. He supposes he will be transported at last. He doesn't much care what becomes of him. As for a home—he has never had a home. He is glad his father has gone away, for he was always a thrashing of him. He will say all this to you, will Any body's child. Admitted.

Any body's child here begins a true story, a little colored. He watches narrowly the expression of his questioner, and shapes his answer

according to the result of his observation. He thinks there is a chance of getting something out of his listener, perhaps half-a-crown, perhaps a passage to the diggings; but he is afraid it may be an introduction to some reformatory institution.

Any body's child plays a third part. Admitted. This is played when he is accosted by an inquirer who is the sworn advocate of popular education. Herein the child is a mass of ignorance. He has never heard who is king or queen. He is not certain that it ain't the Black Prince. How should he know? He has heard of the Creator once or twice, but knows nothing about the New Testament. Cannot read or write; wishes he could. Will go to the ragged school; wouldn't he like to? But he must have something to eat, afore he can think of learning any thing. Has heard of all sorts of places built to do good to him; but he doesn't like them. He isn't fond of work. It's a hard life in the streets; but he will get used to it in time.

All this admitted. Admit on the other hand—you must, if you admit the sun and the eternal heavens to be realities—that *while opponents discuss theories, he grows up to Newgate and perdition.*

Yet, truly regarded, Any body's child is something more than this worthless little wretch and irredeemable outcast. Because he cannot be made to mend his ways in a few weeks; because it is not easy to make him the quiet inhabitant of a monotonous House of Refuge; because he cannot recognize a ministering angel in a police officer; because he is slow to learn, and has a disgust for the irksome foundations of education; because the wild animal of a city alley cannot, in a few days, become a lap-dog for lady visitors to pat and smooth; voices begin to cry aloud that the case is hopeless. Let our voice cry aloud, instead, To whom does Any body's child belong? To some of us, surely, if not to all of us. *What are our laws, if they secure for this child no protection; what are we, if, under our eyes, Any body's child grows up to be Every body's enemy.*

Any body's child is undoubtedly Some body's child. To discover this Some body, who basely deserts it, should be the duty of the State; and the law's heaviest hand would we lay upon this Some body. The State, professing and calling itself Christian, and therefore refusing to breed plagues and wild beasts and rubbish to be shot into the bottomless pit, *should systematically take that child, and make it a good citizen.* And as it can, in most cases find out Some body when he or she has done a murder on the body, so let it find out Some body guilty of the worse murder of this child's soul, and punish that heaviest of all offenders, in pocket and person.

Any body's child is a little fiend, a social curse, a hypocrite, a liar, a thief. Admitted. But if the State had long ago made Some body accountable for the child, and taken upon itself the duties of parent, Any body's child, in lieu of the dreadful creature you recoil from, would now be a hopeful little fellow, with the roses of youth upon his cheeks, and the truth of happy childhood on his lips.

Any body's child cannot too soon become the adopted of us all; and the Some body who gave it birth cannot too soon or too relentlessly be made to pay the charges of the adoption, or be punished in default. Recent conferences on this shame to England have renewed our hopes of Any body's child. Reader, as you have children of your own, or were a child yourself, remember him!

From the Knickerbocker Magazine.

LITTLE PEOPLE'S SIDE-TABLE.

A WEE fellow was learning to read in a picture-primer. He commenced one morning "H-e-n." Well, what does that spell? It puzzled him; but after ogling at the picture a mo-

ment, his face suddenly brightened, and, looking up triumphantly, he ejaculated:

"Rooster!"

ANOTHER, at another time, happened to be reading of the curious skin of an elephant.

"Did you ever see an elephant's skin?" I asked.

"I have!" shouted a little "six-year old" at the foot of the class.

"Where?" I asked, quite amused at his earnestness.

"On the elephant!" said he, with a most provoking grin.

He had seen "the elephant," that boy, young as he was.

A LITTLE boy came in one morning, with his eyes wide open, and inquired if the Chinese stood on their heads.

"No," I answered, somewhat surprised at the question; "why?"

"'Cause," said he, "Jim Brown says they live under us, on the other side of the world, and I don't see how they stick, any how."

A LITTLE girl here, after repeating her usual prayer which her sick mother had taught her, asked if she might say "words of her own." Leave been given, she went on:

"O Lord! don't let my ma die, nor my pa, nor gran'-pa, nor gran'-ma, nor any of my uncles and aunts, or any of my cousins; and don't let our hired girl die; but, O Lord, you may let who else die you are a mind to!"

—•••—

TWO OR THREE THOUSAND PIGS.—During a recent visit to the interior, we heard of an incident not yet cold on the breath of local circulation, which had as well receive newspaper life and immortality now as at any other time. A city-country gentleman of the section, which we were visiting, who *listphs* after the most approved fashion, wanted a few pigs, for the purpose of supplying his family with roasters in the fall and bacon in the winter. He had a new man-of-all-work, who was not very familiar with his peculiarity of speech, and had not exactly taken the trouble to acquaint himself with the line of business in which his employer was engaged.

"John," said the city-country gentleman, one day after breakfast, "go out this morning and buy me two or three thows and pigs."

"Yes, sir," replied John, "it shall be done."

John did not return till late in the day, when he was met by his master and accosted thus:

"Did you get 'em?"

"No sir," answered John, "not all. The drovers have been about buying up large numbers, and I could get only eight hundred."

"Eight hundred *what*, thir?" demanded the master impatiently.

"Eight hundred *pigs*, as you told me," replied John.

"I told you no such thing. I told you, thir, to go and buy me two or three thows and pigs."

"I know it," answered John, "but I couldn't get two or three thousand. I've been out all day, and scoured the whole country, and could get but eight hundred."

Light now, for the first time after the order had been given, flashed on the gentleman's mind. He comprehended the cause of the misunderstanding, and although not exactly in the mood for laughing, very good naturedly pocketed the costly joke, and asked:

"How many did you get, John?"

"Eight hundred, sir, and that was all I *could* get."

"And did you *buy* them outright, John, or only talk of taking them?"

"Bought them for good," replied John, "and had hard work to keep them out of the hands of the drovers, and the owners will be here for their pay in the morning."

The best of the joke, so far as the gentleman was concerned, is to follow. This happened last season. The hogs were received, kept and fed for a short time, and then sold for the block at a handsome profit.—*Louisville Courier.*

For the American Agriculturist.

FACTS IN FRAGMENTS.

A hog's taste would not generally be considered very fastidious, but, according to Linnaeus, the hog eats only 72 species of plants, while the horse eats 262; the cow, 276; the sheep, 387; and the goat, 449.

The Potato is a native of South America, and is still found in Peru and Chili growing wild, in which state it is small and bitter. It is said to have first attracted the notice of a European botanist by its flower. Potatoes were introduced into Great Britain in the latter part of the sixteenth century, but by whom is uncertain. Some historians say by Sir Walter Raleigh, while others mention other adventurers to the new world. They were at first cultivated as rarities, without any idea of their importance as an article of general cultivation. Their spread over the countries of Europe was slow, and in some of them they are now but little cultivated.

Wheat and Rye grow spontaneously in Tartary and Siberia. Wheat is also indigenous in Sicily. Oats grow wild in Abyssinia. Buckwheat is said to be a native of Asia. The native country of Barley is unknown. Indian Corn is a native of America. Rice of Ethiopia. It was introduced into South Carolina from Madagascar, in 1693 or 4. Artichokes, Cabbage, and Lettuce, are said to be natives of Holland; Asparagus of Asia; Onions and Garlic of various eastern countries; Horse Radish of China; Mustard of Great Britain; Beans of the East Indies; Pumpkins of America; Peaches and Cherries of Persia; Plums and Apricots of Asia; Hemp of Persia and India. Flax grows spontaneously in Persia, but the cultivated variety is supposed to have originated in Egypt. Tobacco is a native of America. It is supposed to have been introduced into England in 1586, by Ralph Lane and the colony under his command, who returned from Roanoke in that year. Probably it was introduced by order of Sir Walter Raleigh, under whose auspices the colony had been sent out, who had learned its use of the Indians, or in France, where it had previously been introduced by Nicot, from whom it takes its generic name, *Nicotiana*. The Sugar Cane is a native of China or the East Indies, where sugar has been manufactured from it from a very remote period. Sugar is first mentioned by a European writer, A.D. 625, but for centuries after was sold only as a medicine, and previous to its cultivation in the West Indies it did not come into general use as an article of food.

Previous to the commencement of the sixteenth century, our English ancestors appear to have known little of gardening, as they imported their vegetables from the Netherlands.

Merino Sheep were first introduced into this country in 1802, by Robert R. Livingston. The same year one hundred were imported at Humphreysville, Ct., by Gen. Humphreys, at that time Minister to Spain.

A singular custom prevails in Valetta, the capital of the Island of Malta, which effectually

protects the inhabitants from all danger of purchasing adulterated milk. The milkmen take their goats to the doors of their customers in the morning and evening, when the customer sends or brings out a vessel, and the goat-herd, kneeling down by one of his animals, milks from it the required quantity.

The custom with persons who cannot write of making their mark in the form of a cross, thus, +, originated in the days of papal ignorance and superstition, when it was ordained that those who were unable to write their names, should make a cross to show that they were Christians. H. S. V.

RUNNING DOWN A COMPETITOR.—If it be policy for a tradesman to run down the goods and character of a competitor, the following may be considered an exception to the general rule:

"What's the price of that coat?" inquired a countryman, the other day, of a merchant in this city.

"That? The price of this, sir, is eight dollars; and very cheap at that price," answered the merchant.

"I can't exactly agree with you then," said the customer; "I only paid six for the one I have on."

"That may be," replied the merchant, "and I should consider that you would have been horribly bitten, if you had paid half that sum for it. I don't sell such goods as that. Why look at it! it is miserable stuff, and merely basted together, at that; and the man who sold it to you knew it at the time. He is a great cheat, whoever he is, and deserves to be publicly condemned."

"That's just the opinion I've had of him ever since I made the purchase," said the customer; "I bought this coat of you some six months ago!"

The merchant was suddenly reminded of some other business that needed his attention, and left the customer in the hands of his clerk.

A MODEL CHRISTMAS PRESENT.—We met one of our industrious young mechanics, who was congratulating himself upon having found in his stocking, this morning, a most elegantly wrought purse, with fifteen dollars, in bright gold, "enclosed," the purse made by his happy young wife, and the money saved by her from his regular contributions for family expenses. Besides the affectionateness of this appropriate holiday *douceur*, it is a text from which a whole volume of good sermons might be written on the subject of household economy. It reminds us of Solomon's beautiful proverb about a good wife.—*Ohio Statesman*.

OYSTER LIFE.—An imaginative naturalist has pictured the life of an oyster as one of the happiest of destinies. He has described him as carefully lodged in a dwelling of pearl, fed with the rich produce of the swelling tides, growing delicately corpulent with luxuries which he receives by the mere trouble of opening his mouth, soothed to slumber by the gentle ripple of the waves that roll above and around him, and cheered amid the intervals of his almost continuous dreams by the consideration that his death even is to be glorious as that of the white bull sacrificed to Jove, or the tender virgin who saved her country by her passage down the throat of the Minotaur. Faint ideas of discomfort are suggested by such traditions as those of the "Oyster crossed in love;" but on the whole, the lot of the oyster is a glorious one. He swims in a sensuous paradise until the crash of the oyster-knife comes thundering in to put an end to his life; and then he lies white, succulent, and resigned, ready to be offered an unresisting sacrifice to the gastronomic sensibilities of some refined palate.

"YOUNG AMERICA."—The Lafayette (Ind.) *Journal* tells a good story of a precocious little fellow who walked into the house of a citizen of that city one day last week, and after taking a seat by the fire, very coolly informed the lady of the house that he was on his way to Chicago, and, if they had no objection, he would remain over night. The lady, of course, consented, and the little stranger was kindly cared for. He gave his name as Charlie, and said he lived in Cleveland. When asked what he was going to Chicago for, he answered that he was "traveling for his health." All attempts to obtain the name of his parents were unavailing. He obstinately persisted that he *never* had any.

THE WORST OF IT.—"Do you want any berries, ma'am?" said a little boy to a lady one day. The little fellow was very shabbily clothed, and his feet were bare and travel-stained. In both hands he held up a tin pail full of ripe raspberries, which were prettily peeping out from amid the green leaves that lay lightly over them. The lady told him she should like some; and taking the pail from him, she stepped into the house. He did not follow, but remained behind whistling to some canaries hanging in their cage on the porch.

"Why do you not come in, and see if I measure your berries right?" said the lady, "how do you know but what I may cheat you?"

The boy looked archly up at her and smiled. "I am not afraid," said he, "for you would get the worst of it, ma'am." "Get the worst of it!" said she, "what do you mean?"

"Why, ma'am, I should only lose my berries, and you would be stealing; don't you think you would get the worst of it?"

INTERMARRIAGE OF BLOOD RELATIONS.—The *Frederickburg News* says: In the county in which we were raised, for twenty generations back, a certain family of wealth and respectability have intermarried until there cannot be found in three or four of them a sound man or woman. One has sore eyes, another scrofula, a third is idiotic, a fourth blind, a fifth bandy-legged, a sixth with a head about the size of a turnip, with not one out of the number exempt from physical or mental defects of some kind. Yet this family perseveres to intermarry with each other, with these living monuments constantly before them.

LARGE OX.—The *Ogdensburg Sentinel* says Mr. Perkins, of Hydepark, Vt., has an ox on exhibition in Ogdensburg which weighs 3,935 pounds. This Behemoth was raised at Hydepark, is now in his sixth year, and is still growing, having gained the past year nearly 400 pounds. He stands 6 feet 4 inches high, and measures from rump to nose 12 feet 4 inches, and from tip to tip 20 feet. He is considered the largest specimen of horned cattle in the world. Mr. Perkins is on his way to Illinois, whither he has removed his family, in order as he says, to let the animal attain his growth, Vermont being too crowded for that purpose.

SUBSTITUTE FOR THE COMMON BRICK.—Martin Keenan, of Milford Mass., says—"I think a substitute for brick, as good and cheap, can be manufactured as follows: Take a metal mould, first filled with heated gravel, and then pour melted glass into it, and leave it to cool gradually. I think each mould would not require more glass than is contained in a common black bottle. These are sold for a cent each, the blowing of which must cost half that sum." There appears to be something in this.

"MOTHER, what is a *hush*?" "A *hush*, child? I do not know—what makes you ask?" "Cause the other day I asked Jane what made her back stick out so, and she said *hush*."

WHEN Adam got tired naming his descendants, he said: "Let all the rest be called Smith."

PROOF THAT FLAME IS HOLLOW.—Pour some spirits of wine into a watch-glass and inflame it; place a straw across this flame, and it will only be ignited and charred at the outer edge; the middle of the straw will be uninjured, for there is no igniting matter in the center of the flame; or introduce into the middle of the flame one end of a glass tube, when the vapor will rise through it, and may be lighted at the other end of the tube.

GEOLOGICAL SURVEY OF VIRGINIA.—A bill is before the Legislature of Virginia, and likely to become a law, which provides for a geological survey of the State.

EXPORT OF PIGS AND POULTRY.—We understand that one of Adams & Co's express cars was entirely occupied yesterday with pigs and poultry to be shipped at New-York for England, in answer to orders from that country. The total value of the lot is about \$1,000.—*Boston Traveller.*

SICK HEADACHE.—The following cure for the sick headache was furnished to the *Boston Medical Journal*, by Dr. N. S. Folsom, of Portsmouth, N. H.:

Take any number of drops of Croton Oil, mix them with flour and molasses, and make as many pills as drops of the oil used. When the patient begins to feel the sick headache coming on, one-half of a pill is to be taken every hour in molasses, or something of like consistence, until it acts as a cathartic; and thus treat the sick headache at each attack. If thus taken, each attack will be less severe, and in some cases a few doses produce a permanent cure. He seems to think the Croton Oil acts in three ways: 1st. By increasing the secretions. 2d. By counteracting the anti-peristaltic action of the stomach and bowels; and 3d, by acting as a counter-irritant to the brain.

SPECIAL NOTICE TO ALL SUBSCRIBERS.

We find that by using such good paper, our volume of 832 pages will be quite large to bind, and especially large for those who wish to stitch their paper together with an index, without being at the expense of binding. To obviate this, we have concluded to be at the expense and trouble of making out an extra index with No. 26, so as to form a complete volume of the first 26 numbers. The index for the next 26 numbers will be given at the end of the year, or with No. 52. This arrangement will make it convenient for all, as the 52 numbers can be stitched or bound in two volumes with an index for each, or in one volume with the double index at the close.

We hope all will preserve their numbers, for there are many single articles each of which will be worth the price of the volume, for future reference. When the paper arrives from the post-office, a good plan is to see that it is properly folded, and then pin or sew it through the middle and cut open the leaves. It is very easy to stitch 26 numbers together. To do this, arrange them in regular order, and with an awl punch several holes about one-fourth of an inch from the back, and through these run a strong thread two or three times with a darning-needle, and the work is done. We have scores of volumes of papers, pamphlets, and addresses, thus prepared, which serve all the purposes of a bound volume, and occupy less room in storing and carrying. We would, however, prefer to see volumes of agricultural papers neatly bound and laid upon the book-shelves or tables of farmers. They are much better and more appropriate ornaments, than gilded volumes of trashy magazines or novels.

ONE WORD MORE.—We thank our friends for the liberal aid they have afforded us in extending the circulation of the *Agriculturist*. Our list has increased beyond our expectation, and we are daily encouraged to labor with the

utmost diligence, to make our paper worthy of the confidence and admiration of our largely increasing list of readers. Our reliance for the continuance and increase of our list is upon those who are already readers. As stated above, we now divide the year so as to give either one or two complete volumes of the 52 numbers. This number begins the second volume or half of the year. We respectfully request all our present subscribers to make a little exertion at this time, and each send us on at least one new name. If you cannot get your neighbors to send on for a year, ask them to try the paper for six months, as in that time they will get a complete volume of 416 pages with index for \$1, or less if clubs are formed. Where clubs already exist new names may be added at the same rate, and these names may be at different post-offices. See the last page for terms, special notices to subscribers, &c.

TO CORRESPONDENTS.—We have several communications on hand which we will look over as soon as we have time, and some of them will be published. It is no trifling labor to prepare for the printer many communications which we receive. Some are written so closely that there is not room to put in corrections, without re-writing the whole. We cheerfully prepare articles, unless there is manifest want of care on the part of the writer. If he does as well as he can, we make all needful changes and corrections.

As most writers doubtless wish to improve their own style, we suggest to them to keep an exact copy of their communications, and then compare this copy with the printed sheet. They may often learn something in this way.

We are not anxious to receive original poetry. We have little space for rhyme, and we have good selections enough to last us a year at least. Good poetry, however, will not be rejected; but we advise all who attempt to write in verse to remember, that good *rhyme* does not constitute *good poetry*; on the contrary, some of the best poetry we have ever seen does not "rhyme" at all, while some of the best *rhyme* contains not a single poetic sentiment.

Markets.

REMARKS.—Flour has fluctuated the past week 25 cents per bbl., but closes at our last rates. Corn is 2 to 3 cents per bushel lower than last week. Some are looking for a re-action in breadstuffs; but we noticed in our latest advices from Europe, that extraordinary measures were taken in the Baltic ports to forward wheat to England. Shippers have been at the expense, in some instances, even of cutting canals through the ice in the harbors, to haul out their vessels loaded with grain for the English market. Such efforts as these will have considerable influence in keeping down the corn market.

Pork a decline of 50 cents per bbl. Lard and Beef unchanged. Cotton a decline of $\frac{1}{4}$ cent per lb., Rice no change, Sugar a slight improvement.

Money is more in demand, and worth outside of the banks 9 to 15 per cent. Stocks have given way more or less the past week.

The weather continues favorable for spring work, and the gardens around us are being rapidly planted with salad, peas, potatoes, &c. An unusual large quantity of spring wheat and rye are being sowed, and preparations are making for an extra quantity of barley, oats, and corn. This is wise on the part of the farmers, as all these products are likely to bring good prices the ensuing season.

PRODUCE MARKETS.

Wholesale prices of the more important Vegetables, Fruits, &c.

Washington Market, New-York, March 11, 1854.

VEGETABLES.—Potatoes, Junes, $\frac{3}{4}$ bbl., \$3; Western Reds, \$2 50; Mercers, \$3 25; Merinos, \$2 37 $\frac{1}{2}$; Onions red, $\frac{3}{4}$ bbl. \$2 37 $\frac{1}{2}$; yellow, \$2 50; white, \$3; Turnips, Russia, $\frac{3}{4}$ bushel, 68c.; white, 62 $\frac{1}{2}$ c.; Cabbages, $\frac{3}{4}$ doz., \$1 12 $\frac{1}{2}$; Carrots, $\frac{3}{4}$ bushel, 62 $\frac{1}{2}$ c.; Celery, $\frac{3}{4}$ doz. bunches, \$1 25@ \$1 50.

FRUITS.—Apples, Spitzenburgs, $\frac{3}{4}$ bbl., \$1 50; Greenings, $\frac{3}{4}$ bbl., \$4; Russets, $\frac{3}{4}$ bbl., \$3@ \$3 25; Cranberries, of an extra quality, $\frac{3}{4}$ bbl., \$9; Maple Sugar, 12 $\frac{1}{2}$ c. per lb.

NEW-YORK CATTLE MARKET.

Monday, March 13, 1854.

The sales are reported as rather more brisk than last week, and the cattle look full as well as last week.

Washington Yards, Forty-fourth street.

A. M. ALLERTON, Proprietor,

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY
Beeves, 2,009	1,984
Cows, 48	
Calves, 644	
Sheep, 746	300
Swine, 260	60

Of these there were forwarded by the Harlem Railroad, beeves, 47; cows, 48; sheep, 446.

By the Hudson River railroad, beeves, 800; sheep, 300.

By the Erie railroad, beeves, 550; swine, 260.

New-York State, furnished by cars, 630.

From Pennsylvania, on foot, 224.

Ohio, by cars, 776.

Kentucky, by cars, 301.

Mr. ALLERTON gives the following prices: Cattle, 8 $\frac{1}{2}$ @ 10 $\frac{1}{2}$ c.; Calves, 4 $\frac{1}{2}$ @ 6 $\frac{1}{2}$ c.; Sheep, \$3 50@ \$10 per head; Cows, from \$30@ \$50, according to quality.

CHAMBERLIN'S, Robinson street.

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY.
Beeves, 275	
Cows and Calves, 60	15
Sheep, 2,900	450
Veals, 25	

*BROWNING'S, Sixth street.

Beeves, 257	
Cows, 74	
Sheep, 2,628	1200

O'BRIEN'S, Sixth street.

Beeves, 65	
Cows, 87	

The following are the prices at Mr. CHAMBERLIN'S, Robinson Street: Cattle, 8@ 10c.; Cows and Calves, the sales rather slow, and were from \$25@ \$35@ \$50; Sheep, \$3 25 @ \$5@ \$7 and \$10 for some extras. One lot of 600 sold for \$5@ 5 62 $\frac{1}{2}$; Veals, 5@ 7c. per pound.

At Washington Market, Pork in the carcase is worth 7 to 8c. per pound; Mutton, 6 to 8c.

MUSQUIT GRASS.

THE TRUE MUSQUIT GRASS, GROWN BY A CAREFUL Georgia Planter. This has proved the most sure and valuable grass for stock yet cultivated at the South, and is invaluable to the planter. For sale by RICHARD PETERS, Atlanta, Ga., also by R. L. ALLEN, 189 and 191 Water St., N. Y.

SUPERIOR FRUIT AND ORNAMENTAL TREES.—CHAS. W. R. PRINCE & Co., Flushing, Long Island, in consequence of the Railroad passing through their largest Nursery, will sell about 50,000 trees at very reduced prices—comprising Fruit Trees in a bearing state, and Ornamental Trees of the largest size, including the finest evergreens and all other articles. Catalogues may be had at 113 Chamber st., and will be mailed to all applicants. 27-29

SHANGHAI BUFF, GREY, AND WHITE; ALSO BRAMA-Pootras and Malay fowl; 100 pairs assorted for sale. Also Brahma Pootra White Shanghai Eggs, at \$5 per dozen; Black and Buff Shanghai Eggs, \$3 per doz. They also have for sale Trees and Plants, Ornamental Shrubs, Roses and Grape Vines. Catalogue furnished. Apply by mail (post paid) to GEO. SNYDER & CO., Rhinebeck, Dutchess Co., N. Y.

CLARK, AUSTIN & SMITH,

NO. 3 PARK ROW, and No. 3 ANN STREET, HAVE RECENTLY published new editions of the following books: 1. NORTON'S SCIENTIFIC AGRICULTURE. Elements of Scientific Agriculture, or the Connection between Science and the Art of Practical Farming. Prize Essay of the New-York State Agricultural Society. By John P. Norton, M. A.

CATECHISM OF AGRICULTURAL CHEMISTRY AND GEOLOGY. By James F. W. Johnston. With an Introduction by John P. Norton. 26-29-31-33

CHARTER OAK GRAPES.

NOTICE.—THE UNDERSIGNED WISHES TO DIRECT particular attention to these magnificent grapes, which he has propagated with such success, that they are beyond comparison the largest grapes known. He has many one and a half inches in diameter. The grape is perfectly hardy, and will endure the winter, and ripen 2 or 3 weeks sooner than the Isabella or Catawba. The Charter Oak Grape is unsurpassed for preserving and for wine—and a delicious table fruit. Orders up to 1st May received by subscriber, at 5 Scammel street, New-York city. After that date at Frankfort, N. Y. [27-] JOHN P. WILSON.

MORRIS FEMALE INSTITUTE.

THIS INSTITUTION IS SITUATED AT MORRISTOWN, N. J., about an hour and a half's ride from the city of New-York on the Morris and Essex railroad; the cars leaving New-York several times a day. It has been ably patronized for the last six years. There will be a vacancy for a few more pupils in April.

Faithful teachers are provided for English branches usually required; also Drawing and Painting. French, Latin, and Spanish under a native teacher. Vocal and instrumental music by an accomplished player, whose time and attention has been for years devoted exclusively to this object.

Further particulars, and circulars, may be obtained by applying to J. A. SEELEY, Principal, or at the book-store of Messrs. C. Shepard & Co., 152 Fulton street, near Broadway, or at this office.

Persons wishing to send their daughters from home, would do well to visit this Institution before deciding. 27-4f

FRESH GARDEN SEEDS OF ALL THE BEST VARIETIES. Also a choice collection of GREEN-HOUSE and GARDEN PLANTS, FLOWER ROOTS, &c. For sale at A. BRIDGEMAN'S HORTICULTURAL ESTABLISHMENT, Nos. 874 & 878 Broadway, above 18th street, New-York. 26-38

EARLY EXCELSIOR POTATOES.—THIS IS A NEW AND very superior sort. They are as early as the June potatoes, grow above the average size, are mealy and palatable, and have kept better than any other variety planted in this vicinity. The rot has never been known among them. 26-4f R. L. ALLEN, 189 & 191 Water st., N. Y.

WILLARD FELT, NO. 191 PEARL STREET, (NEAR Maiden Lane), Manufacturer of Blank Books, and Importer and Dealer in Paper and Stationery of every description. Particular attention paid to orders. 26-77

NURSERY STOCKS.—QUINCE, PLUM AND CHERRY Stocks for sale, also cherry pits in their season, packed in damp moss, suitable for transportation to any part of the United States. Apple and quince seed &c., &c. Orders from any distance promptly attended to. Address, post-paid W. H. DAY, 26-4f Morristown, Morris Co., N. J.

ASSISTANT EDITOR WANTED.

THE PUBLISHERS OF A STANDARD AGRICULTURAL Journal wish to secure the services of a young man who has had experience in the farm and in the garden, and who is capable of assisting in the office duties of a paper, such as writing and preparing articles, correcting proof, answering correspondence, &c. To such a man there is a fine field open, both for self-improvement and for rising in the editorial profession. The place is a good one for a young man who has just completed a collegiate course, provided he has had sufficient farm experience to qualify him for an accurate observer and writer on agricultural subjects. Salary first year moderate. For further information address ALEXANDER, to the care of the editors of the American Agriculturist, New-York, stating age and experience, and sending articles of composition if he has written any for the press. Communications on this subject will be considered strictly confidential. 25-27

NO. 1 SUPERPHOSPHATE OF LIME.—THIS VALUABLE fertilizer has been used for several years in England and other parts of Europe, and, next to Guano, holds the highest rank in popularity, and the extent to which it is used among farmers. Its introduction in this country has been more recent; but the progress it has made in the estimation of the public has not been less marked or successful than abroad. It is now extensively used throughout the Northern States, after a full trial and investigation of its merits; and it is rapidly becoming, like its predecessor, Guano, a favorite manure at the South and West.

It is composed of crushed or ground bones, decomposed by the addition of about one fifth their weight of sulphuric acid, diluted with water, to which is added a due proportion of guano and sulphate of ammonia. The latter is the active and one of the most efficient agents in the best Peruvian Guano.

It is suited to any soil in which there is not already a full supply of the phosphorus, which is seldom the case. All crops are benefited by its application.

For sale in large or small quantities, in bags of 150 lbs. each. No charge for packages. All bags will be branded "C. B. De Burg, No. 1 Superphosphate of Lime."

PERUVIAN GUANO of best quality.

AGRICULTURAL AND HORTICULTURAL IMPLEMENTS of all kinds.

FIELD AND GARDEN SEEDS, of various sorts, fresh home grown and imported.

THE AMERICAN AGRICULTURIST—weekly, \$1 per volume—two volumes a year.

For sale at R. L. ALLEN'S Agricultural Warehouse and seed Store, 189 and 191 Water street, New-York. 25-2f

FOR SALE AT THE SOUTH NORWALK NURSERY. The Great New-Rose or Lawton Blackberry Plants; also plants of the White fruited Blackberry. For sale also a large stock of small plants of the new or North River Red Antwerp plum, at the low price of fifteen dollars per thousand. The above plants all warranted.

GEO. SEYMOUR & CO.,
South Norwalk Nursery, Conn.

24-36

ATKINS' SELF-RAKING REAPER.—40 of these machines are used last harvest in grass or grain or both, with almost uniformly good success, in nine different States and Canada. TWENTY-SIX PREMIUMS, including two at the Crystal Palace, (silver and bronze medals,) were awarded it at the autumn exhibitions. I am building only 300, which are being rapidly ordered. Mr. Joseph Hall, Rochester, N. Y., will also build a few. Early orders necessary to insure a reaper.

Price at Chicago \$175—\$75 cash with order, note for \$50, payable when reaper works successfully, and another for \$50, payable 1st December next with interest. Or \$150 cash in advance. Wanted to be a good Self-Raking Reaper.

Agents properly recommended, wanted throughout the country. Experienced agents preferred. It is important this year to have the machines widely scattered.

Descriptive circulars with cuts, and giving impartially the difficulties as well as successes of the reaper, mailed on post-paid applications. J. S. WRIGHT.

"Prairie Farmer" Warehouses, Chicago, Feb., 1854. 23-35

POUDRETTE.

THE LODI MANUFACTURING COMPANY OFFER their Poudrette for sale in lots to suit purchasers, from a single barrel up to 4000 barrels, at their usual rates, \$1 50 per barrel for any quantity over seven barrels, delivered on board of vessel in the city of N. York, free of cartage or other charge. When 200 or 300 barrels are taken, a deduction will be made from the above price. That this article has stood the test of fourteen years trial is proof of its efficacy. It is the cheapest and best manure for corn ever produced, and it has the advantage of being useful in small quantities and harmless in large. It is a capital manure for peas, strawberries, &c., and all garden vegetables. Apply by letter or personally to the Lodi Manufacturing Company, N. York.

22-34

GARDENER FOR THE GREEN-HOUSE AND GRAPE-HOUSE.—Wanted a Gardener as above, who is experienced in the management of the Green and Grape-House in the United States. None need apply except fully qualified. A. B. ALLEN, 189 Water st.

SEEDS FROM THE CRYSTAL PALACE.—A few choice samples of Two rowed Barley, Four rowed Barley, White Poland Oats, Black Prince Edward's Island Oats, Spring Wheat, Timothy, and Flax Seed, for sale by R. L. ALLEN, 189 and 191 Water st.

HOUSE WANTED FOR A SMALL FAMILY.—ONE A few miles from the city, and of easy access daily, would be preferred. A plot of ground attached would be desirable. Possession wanted immediately, or at any time before the 1st of May. A good tenant, and perhaps a future purchaser, may be heard of by addressing or calling upon J., at office of this paper.

DIRECTIONS FOR THE USE OF GUANO.—A full and minute description of the different crops and soils to which Peruvian Guano is adapted, with full directions for its application, a pamphlet of 96 pages, and can be sent through the mail. [21f] R. L. ALLEN, 187 and 191 Water st.

SHEPHERD DOGS.—WANTED ONE OF THE ABOVE Dogs of the Scotch Collie breed. He should be under one year old, and partially trained. Name lowest price at once, which must be moderate. A. B. ALLEN, 189 Water st.

GARDEN IMPLEMENTS.

HEDGE, LONG-HANDLE, AND SLIDING PRUNING SHEARS; Budding and Edging Knives; Pruning Lathes, saws and knives; pruning, vine and flower scissors; bill and Milton hooks; lawn and garden rakes; garden scufflers, hoes of great variety, shovels and spades; hand engines, which throw water forty feet or more, syringes and water pots; grafting chisels, tree scrapers, and caterpillar brushes; transplanting tools, reels; hand plow and cultivator, very useful to work between rows of vegetables, together with a large assortment of other implements too numerous to mention. [21f] R. L. ALLEN, 187 and 191 Water st.

MEN AND BOYS' CLOTHING, AT WHOLESALE AND RETAIL.—Cheaper than ever, at J. VANDERBILT'S, No. 81 Fulton street, New-York. A very large assortment of all qualities and sizes; also a splendid assortment of fashionable goods, which will be made to order in a style that cannot be surpassed. Also India rubber clothing and furnishing goods. Your patronage is respectfully solicited. 2-30 J. VANDERBILT, 81 Fulton street.

Iron Chairs, Iron Hat Stands, and all kinds of Ornamental Iron Furniture, bronzed in a most beautiful manner. All kinds of Iron Fence and Verandah Work, made at very low rates. G. MAUREL, Manufacturer, 175 William street, between Beckman and Spruce, N. Y. 2-35

HOUSE FURNISHING AND MECHANICS' HARDWARE.—M. DA COSTA & CO. offer for sale all articles in the above line cheap for cash. All articles warranted, exchanged or taken back. No. 206 Chatham street, opposite Division street, N. Y. 6-31

LIVERY STABLES.

NORTHROP & POST'S DROVE AND SALE STABLES, corner of Third Avenue and Twenty-fourth street, New-York. The subscribers, formerly proprietors of the Rose Hill Stables, respectfully announce to their former patrons and the public generally, that they have taken the five new fire-proof brick stables, capable of holding 300 horses, directly opposite the Bull's Head Hotel, and, by their efforts to please, hope to receive a fair share of that patronage which they so strongly solicit. R. K. NORTHROP, N. POST.

New-York, April 1st, 1853. N. B.—New wagons and harness for the accommodation of their customers. 1-34

CONKLIN & HUGG, LIVERY STABLES, NOS. 63 & 65 Twenty-fourth street, between Lexington and Third Avenues, (office on Twenty-fourth street,) New-York.—Coaches, Light Wagons, and Horses to let on most reasonable terms. Horses kept by the day, week, or month. 1-40

FRENCH BARR, ESOPUS AND COLOGNE MILL-STONES. Mill Irons and Machinery of every description, at the Columbian Foundry, 45 Duane street. 1-26

MACHINERY, PATENTS, &c.

IRON AND STEEL.—SANDERSON BROTHERS & CO. Sheffield, warranted Cast Steel. New-York, E. F. Sanderson, 16 Cliff street. Boston, J. B. Taft, 21 Doane street. Philadelphia, E. Frith, 42 Commerce street. New-Orleans, A. Robb, 24 Bank Place. 2-43

MANUFACTURES.

RANGES AND HEATERS.—I AM NOW PREPARED TO supply those in want of a Cooking Range with one that is not only economical, but combines more conveniences for boiling, baking, &c., than any other in use. Also, the Etna Heater, for warming houses of any size. Apply to A. McPHERSON, No. 233 1/2 Water street. 2-40

FISH HOOKS AND FISHING TACKLE, NEEDLES, &c.—HENRY WILLSHER, Manufacturer and Importer of Needles, Fish-hooks and Fishing-tackle, consisting of Limerick and Kirby salmon, trout, bass, pike, perch and other Hooks; Salmon, Lake, and Trout Flies; Cork and Wood Floats; Flax, Twisted and Plaited Silk, Chinese Grass Hair, and Cable-laid Lines; Bowed, Swivel, Hollow, and Plain Sinkers; Flax and Silk Lines ready for use; Silk-worm Gut; Snells; Double Twist, and Single Gut Leaders; Spoon Bait; Squids; Multiplying and Plain Reels, Nets, Artificial Fish; Walking-ane and other Rods; Lolley's and Chambers' Sail Needles; Pack and Willsheer's superior Sharps and Between Needles, &c. Cheap for cash, in lots to suit purchasers, at No. 9 Cedar street, New-York. N. B.—Orders per mail or otherwise promptly attended to. 2-40

MISCELLANEOUS.

GREENWICH POTTERY, 251 WEST EIGHTEENTH street. Steam-pressed Vitreous Drain Pipe, from three to eighteen inches in diameter, and in two feet lengths. The best and cheapest medium for drainage and sewerage ever yet offered to the public. The subscriber is the exclusive manufacturer of steam-pressed Drain Pipe in this country, and he offers it to the public on as favorable terms as the ordinary drain pipe made or sold in this city. 2-27

WHOLESALE FISH STORE.—500 BBLs. SALMON, 2000 bbls. Mackerel, first quality, 3000 Small Packages Mackerel, 200 bbls. New Shad, 500 halfs Shad, 1000 bbls. New Herring, 300 halfs New Herring, 1000 quintals New-Dried Cod-fish, 500 Jars New Anchovies, 500 Kegs New Dutch Herring, 2000 Boxes New Smoked Herring, 3000 lbs. New Smoked Salmon, 500 Kitts New Soused Salmon, 500 Kegs New Spiced Herring, Sword-Fish, Blue-Fish, Pickled Cod, Haddock, Halibut, White-Fish, Sturgeon, Trout, Duff-Fish, &c.

For sale by NELSON WELLS & CO., 81 Dey street, between Washington and West New-York. May 13th, 1852. NELSON WELLS. 1-52 S. H. WOOD.

SEEDS.

SEEDS.—TIMOTHY; RED AND WHITE CLOVER; BLUE Grass; Orchard Grass; Ray Grass; Red Top; Sugar Corn; Peas; Beans; Turnip; Cabbage; Beet; Lettuce; Onions; Radish; Squash; Orange; and Sarge Yellow Locust, and all other kinds of field and garden seeds. Also Rubarb roots; Asparagus Plants, &c. R. L. ALLEN, 187 and 191 Water street.

STOCK.

IMPROVED STOCK OF ALL KINDS.—HAVING HAD great experience in breeding and rearing fine stock for the past twenty years, I offer my services to my friends to procure it of the best and most reliable kinds. As much notice as convenient is at all times desirable previous to purchasing, as it takes time to make good selections. Early in August or September is the best time to purchase for the South.

Short Horn or Durham cattle, Devons, Herefords, Alderney or Jersey and Ayrshires. Long-wooled Sheep—the Cotswold, Oxford, Leicester, Bakewell, and Lincoln. Mutton Sheep—the Southdown. Fine-wooled Sheep—such as the Saxon, Spanish, and French Merino.

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, which are spurious.

1-1f A. B. ALLEN, Nos. 189 and 191 Water street.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master, and ask him to mark the envelope, *Registered by* —, P. M.

BACK NUMBERS are usually kept on hand, and when a subscription is sent without naming any date for commencing, the back numbers from the beginning of the current volume will be sent, unless as sometimes happens, an unusual rush of subscribers has exhausted the supply.

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In writing, always give the Post-office (instead of the town) and the County and State. *Write these very plainly.*

Clubs may add to their number at the same rate per copy as was paid by the original members.

Those wishing their papers changed from one office to another, should give the name, county, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished with Harper's Magazine, one year for.....	\$4 00
" Putnam's do.....	4 00
" Knickerbocker do.....	4 00
" Eclectic do.....	6 00
" Little's Living Age do.....	6 00
" National Magazine do.....	3 50
" Dickens's Household Words.....	3 50

Address ALLEN & CO.,

J. A. GRAY, Printer, 95 and 97 Cliff street, N. Y.

PUBLISHERS' ANNOUNCEMENT!

Twelfth Volume of THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of the year for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon *its own merits*; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammeled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDD, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. Wm. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers, - - -	\$2.00 a year, \$2.00
" Clubs of 3 do. - - -	1.67 " 5.00
" do. 5 do. - - -	1.60 " 8.00
" do. 10 do. - - -	1.50 " 15.00
" do. 20 do. - - -	1.25 " 25.00

The money always to accompany the names for which the paper is ordered.

The Post-Master, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Post-Master, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, *Weekly Tribune*, or *Weekly Times*, or any other paper or periodical in this city, not costing to exceed two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if enclosed and mailed in the presence of the Post-Master.

Communications for the paper should be addressed to the Editors; subscriptions, advertisements, and all matters relating to the business department, should be addressed to the Publishers,

ALLEN & CO.,

BEE-KEEPING—A REVIEW.

THE MYSTERIES OF BEE-KEEPING EXPLAINED; being a complete analysis of the whole subject, &c. By M. QUINBY, Practical Bee-keeper. C. M. SAXTON, New-York.

ANOTHER—and that a well-executed volume of 376 pages, of SAXTON's standard editions of agricultural books—on bees! Nor is this volume at all unwelcome, even in this book-producing age; for it is upon a subject of which, although much has been written, there is enough always left unwritten for an experienced and practical man to write more, if he does it knowingly, that will benefit every bee-keeper who may make such writings his study.

Mr. QUINBY, is himself a bee-keeper, or apiarian, resident in the valley of the Mohawk. He has given much time and attention to the care of his hives, and appears to have succeeded admirably during an experience, as he says, of "more than twenty years." He should, therefore, be qualified to speak understandingly upon the subject; and from what we have read of his book, we think he has well accomplished his object.

There is no description of the "live stock" of the farm, or garden—for people who have nothing of territory beyond a door-yard and garden may keep bees—so little understood in its nature and habits, and regarding which so much error exists, and so much nonsense is believed, as the honey bee. This probably arises from the wild, untameable nature of the insect—the only thing hitherto brought under the dominion of man, which retains its wild and savage nature, without the slightest recognition of human authority, and can, at its own choice, flee from his protection with entire safety to its own existence and future welfare. Six thousand years under the protection of man, and its own wild will alike surrounded by the luxuriance of cultivation, or amid the solitudes of the wilderness, has the bee flourished, without a single deviation from its original habits or economy of life; and whether the swarm be newly captured in the forest and brought to the farm-house, or fled of its own choice from the farm-house to the forest, they are alike in every thing appertaining to what concerns their own "lives, fortunes, and pursuits of happiness," ready, at will, to remain in their newly acquired homes, or exchange them, as before, without detriment to their welfare. It is from a want of this essential knowledge of the nature and habits of the bee, that success in its keeping is so uncertain.

Apiarians, or those who aspire to become so, build costly bee-houses, buy expensive *patent* hives, and prepare its accommodations with much pains; and after having every thing, as they suppose, to content and make the bee happy in its new situation, are astonished to find their young swarms emerging from the parent hive, and heedless of all persuasion, after the most approved modes, to remain, rush off at once to the wildest woods, and seek a habitation in some dilapidated tree which will afford them refuge, spurning thus the benefits of protection, and the luxuries of cultivated fields redolent of the choicest honey harvests, to the gratification of its own wild and capricious nature. Such is the honey bee, and such the disappointments of many of those who strive to keep it under subjection.

To become a successful apiarian, it is necessary to be not only a close observer of the habits of the bee, but to study books which are considered good authority on the subject; and then, with great care, one may become a "lucky" bee-keeper.

It is true, instances have occurred, and they may be familiar to most of our readers, of very stupid or very thoughtless people—people never having read a book in their lives—who have been successful apiarians. But for a time, only. The moment any thing like adversity occurs—that an enemy interferes with the ordinary labors of the apiary, or by untoward natural events, the usual economy of the bees is interrupted—they are brought to a dead stand, and "luck," that controlling deity of the ignorant and superstitious, is at once denounced as the author of all the evil, which, with the intelligent man, would either have been averted, or immediately remedied, through the knowledge he had acquired from observation and study combined. So, let every one who wishes to keep bees and succeed with them, provide himself with a well-digested authority on their management, and make it his study.

The various subjects of remark in his book have been well and methodically arranged by our author, from the birth of the bee, onward through its growth, swarming, hiving, and settlement, to the gathering of its harvests, and the ultimate appropriation of its sweets to the use of the apiarian. Much sound observation is recorded, together with a close knowledge of what appertains to the successful management of the bee, the best size and shape of hive, its locality and position, either within or outside the bee-house,—in short, whatever is demanded of information to propagate, care for, and aid the bee to the most successful result in all its labors, is written in plain, perspicuous language, which only to read it, is to understand.

Like a sensible man, Mr. QUINBY thinks of "patent" bee-hives just as we do, bating the egotism of the remark. Of some twenty patterns, and upwards, sundry of which we have tried, only one or two are worth the cost of the nails and board to make them; and in their use, we have seen enough to know that the bee itself has a great deal more gumption on the subject of its own wants and accommodations, than the man who pretends to teach it, and gives it for a habitation any thing more complicated than a plain, open mouthed, tight box to live, breed, and work in.

Weeks, of Vermont, many years ago, and Minor, of this State, of later date, both wrote—the one a small book of four pages, the other a volume nearly the size of this under notice—on the subject of bees, and both books were valuable. But the first was chiefly to explain and set forth the merits of his *patent* hive, which, by the way, we acknowledge to be one of the best we ever saw, of a *compound* kind; while the other had a very good hive, also a patent, as a sort of addenda to his book. Mr. QUINBY repudiates all the patents; tells us how to make a square box, or something very near like it, and how to fit other boxes, of either glass or wood, upon it, to take the surplus honey.

LETTERS FROM PROF. NASH.—No. 5.

IRRIGATION.

Snow has often been called the poor man's manure; and probably every farmer has noticed that where snow accumulates in winter and lies till late in spring, there the ground appears in better condition and produces improved crops. This may be supposed to arise in part from the protection afforded by the snow-drift; the dry, chill winds of spring are kept from the surface; the soil is kept moist; and excessive evaporation is prevented. There is, however, another cause;—snow has been proved to contain ammonia; it also contains minute portions of organic matter; the ammonia and organic substances pass with the water of melting snow into the soil; they there act as manure on the roots of grass, which gives it an early and vigorous start. This leads me to inquire, whether it might not, in some cases, be worth while to retain the water of melting snow on snow-lands? perhaps to flood a piece of mowing with the water of some spring torrent from neighboring hills? Of course it should be confined to such pieces of land, as from their peculiar situation admit of being thus irrigated, or flooded for a short time, without great expense; and it should be confined to soils not very tenacious, and having a porous sub-soil, so that the water could pass freely off, as by lying dormant on the sur-

face, it would be injurious rather than beneficial. The water thus let on would vary in its character; in some instances it would be impregnated with road-washings; in others, it would contain considerable amounts of various fertilizers, brought along from the regions whence it came; and in all, it would contain the ammonia and the organic matter of the melted snow. I have, therefore, supposed that in some peculiar cases, where all the circumstances favored, it might be worth the farmer's attention to turn such waters on to his mowing, as a sort of spring irrigation.

There is another species of irrigation, of the advantage of which there can be no doubt—one which is generally practised by farmers, but not always—that of turning the water of gutters by the way-side on the adjoining land. During and after heavy rains, such water often flows fully saturated, thickened even, with fertilizing matters. These should be directed, if the shape of the ground permits, to the neighboring fields, instead of running into the nearest brook. With regard to water from barn-yards, it may be said that none should be permitted to flow. This is true. Still many farmers have their arrangements such, and perhaps will have them such, for a long time, in spite of all that can be said, that the water runs in torrents from their yards after every hard rain. Where this is the case, the water should, if possible, be turned upon grass-land; and it should be made to irrigate as large an extent as the nature of the ground permits, as otherwise, it will make a small extent so rich as to be useless—to produce nothing but weeds. As a general rule, wherever on a farm fertilizers are wont to accumulate, if the water of showers, rains, and melting snows runs over these places, it should be so directed as most to benefit the land, instead of running where it will be useless. All these, however, are species of irrigation, which it would seem that common sense might teach every farmer, and of which too much perhaps has been said in this place. I will now speak of irrigation in a more appropriate sense of that term—the turning of natural streams upon grass-lands, so as to cause the water to pass over and through the soil. No specific rules can be laid down for doing this. What is required for doing it in the best manner, is a little of that science, sufficiently rare, though often talked of, called *Farm Engineering*, the principal ingredient in which is *common sense*—a thing which very plainly teaches that it is the prerogative of the *Almighty* to make hills and valleys; that we cannot essentially alter the surface of the earth, and therefore must be content to take it very nearly as it is, and to leave it pretty much as we find it; that water will not run up hill; that it tends to the lowest place by the shortest route, that is, that it will run directly down and not slant-wise on a slope. If we are to prepare the surface of land for irrigation, it will be found necessary to even it somewhat—to level down here a hillock and fill up there a hollow; but the transportation of great amounts of soil cannot be made on paying conditions, where labor is as high as with us. Had the Duke of Portland made his improvements at the present rates of labor in this country, they would have given him but two, or at most, three per cent. instead of eight, on the outlay, because he removed vast quantities of earth, far more than was necessary in order to

accomplish the object, certainly far more than would be wise in a country where labor is as high as with us.

Let the space above be supposed to represent a ten acre lot of snow land. A brook (5) flows through it from west to east. Across this brook (10) is constructed a dam with a gate. A water-channel cut from the dam to the northeast corner of the lot (1) will preserve, by a few windings, as the face of the land requires the level of the water in the dam, so that when the gate is shut the channel (1) will be filled. The wavelip, or bank, of this channel should be leveled with great care; should be stamped hard, sown with grass seed, and then, if it settle unequally, should be regulated from time to time as occasion requires, in order that when the channel is more than filled, the water may run over evenly all the way from 10 to 1. English irrigators insist upon it, that there should be a catch-drain parallel with the water-channel, (1) and about 6 or 8 feet from it into which the water should be admitted from the main water-channel (1) by under-ground passages, capable of being opened and shut. I shall not speak further of this, because I do not believe it necessary. They irrigate with a recklessness of expense, which certainly cannot yet be recommended to the American farmer. I would have the lower bank of the water-channel (1) levelled with great care, and then allow the water to pass over instead of under it. The only objection I have heard to this course is the danger that the bank may give way, and damage be done by the whole of the water in the main channel rushing out at one place; but I do not believe there would be much danger if the bank were properly consolidated and turfed over before being put to use. From the water-channel (1) let the water run down to the catch-drain, (2) thence to the next catch-drain, (3) thence to the catch-drain (4,) and thence to the channel of the brook. In this way about four acres on the north side of the brook would be irrigated.

At 11 is another dam, and from it a water-channel (9) on the south side of the brook. From this the water may pass to 8, thence to 7, and so on back to the brook, irrigating an acre or so on the south side of the brook—in all about five acres, or half of the ten acre lot; and if the brook, as often happens, was somewhat foul, containing considerable quantities of fertilizing matter, it would be likely to cause good crops of grass without other manure; and if the manure made from the grass grown on these five acres were put upon the remaining five acres, the whole might be kept in a highly productive state. But in order to give such results, the brook should be something more than mere by pure water; the soil should be either porous by nature, or well under-drained, as otherwise the irrigation would render it cold and productive of only sour, innutritious grasses; and the surface of the ground should be so arranged that the

water would irrigate the whole, and would nowhere settle into ponds, and remain dormant till it had time to settle through the soil. The true idea of irrigation is that of *water running over ground*, and not *standing upon it*. How often the water is to be admitted, and how long to remain before being shut off, depends much upon the character of the land, and must be learned by observation in each case. It should never, however, remain more than a few days at a time.

Suppose the above straight lines to enclose a piece of new land. A brook (a) enters it at the northwest corner, and passes through the whole length. About two acres of this field are considerably lower than the brook at the place where it enters the lot. These two acres then, can be irrigated by water taken from the upper end of the lot. Suppose now we find the soil of this field to be a light loam, resting on a gravelly sub-soil. If so, no under-draining would be required. Suppose, also, that we find the brook to be rich in fertilizing matters. These would be favorable indications. Suppose further that the make of the ground is such that a water-channel (b) could be cheaply cut from or along the side of the brook, and around the before-mentioned two acres, preserving all the way the turns of the brook at a, so that without the expense of a dam even, this channel could be always kept filled and overflowing with water. But we find that the enclosed two acres is of such shape that the water, as it runs over the channel, will not flow equally over the whole surface, but will come together into larger or smaller rills, and thus drown a part of the land, without touching the rest. The way to obviate this difficulty will be to cut catch-drains from which to distribute the water again, and so to serve a nearly equal distribution over the whole. Let us then cut the catch-drain, (c,) humoring its direction to the make of the ground, so as to keep the elevation equal from end to end. Then, as the water flows over this, cut other catch-drains as may be necessary to prevent the water forming itself into rills, instead of spreading over the whole ground; as d, &c.

If this plot of two acres, done as I have described, should be found on trial to have doubled its produce, the owner would wish that he could get the water of that brook upon other parts of his field. The surface of the whole field, except these two acres, is higher than the brook, at any point within his own enclosure. He finds, however, that by going up the stream a few rods into his neighbor's land, he could then draw off the water at such an elevation as would carry it over the whole slope of land lying north of the brook (e, e, e). This, if he can bargain with his neighbor on reasonable terms for the privilege, he will be likely to do. But there is one thing which he can do without asking favors. On the south side of the brook, at f, is a sandy elevation, nearly round in form, and sloping in every direction from the highest point. The soil is unfit for mowing, and yet it cannot be fenced out without shutting out some of the best of his

mowing. He perceives that if a small basin were excavated in the top of that sandy knoll, and filled with water to overflowing, the rim being nicely adjusted to a common level, the water would diffuse itself in every direction over an acre or two, and might render that barren spot one of the most verdant on his farm. I suppose the summit to be 15 or 20 rods from a slight fall in the brook, and the elevation to be 8 or 10 feet above the stream. Would it be worth the expense, say of from 20 to 30 dollars, to throw on that elevation a stream of water by means of the hydraulic ram, or by a forcing pump to be carried by the stream?

It sometimes, though rarely, happens that a plot of ground lies almost precisely level, and yet so low that a stream of water can be turned upon it. In such a case, irrigation can be effected as above; A representing a stream of water brought from some river, brook, or pond, or possibly from the drainage of neighboring lands; B, a channel to carry off the surplus water after the irrigation has been accomplished; 1, 2, 3, and 4, smaller channels connecting with the main channel A, the ground being first thrown into ridges with the plow, and these smaller channels running along the summits of the ridges, and overflowing on both sides, so that the water will run down a gentle slope into the catch-drains 5, 6, 7, these last to connect with the waste-drain B, and to empty their surplus water into it. In order to irrigate in this way, it would be necessary to bring the whole plot to a very nice level, so that the banks of the channels 1, 2, 3, 4 should be in all parts equally high, as otherwise, the water would discharge itself over them into the intervening catch-drains in some places and not in others; and I do not believe that an effect at irrigation in this way could be commended, unless in cases where, from the nature of the soil and the character of the water, great benefit would be sure to result, especially as great care would be requisite to keep the banks of the distributing drains from settling out of level.

In England it seems to be no matter what an improvement costs, if it but promises to pay five per cent. or more on the outlay. The Duke of Portland's water-meadows have been improved at an expense of \$200,000. Other improvements of a like kind in that kingdom have been made at enormous rates of expense. Especially is it so with the application of sewerage water to lands, as at Edinburgh and other places. Indeed, improvements are now talked of, with regard to the sewerage of London, which, if ever accomplished, will have to be done to the tune of hundreds of millions sterling. There, land is scarce and money plenty; labor is low and produce high, and there is hardly an end to improvements, which it may be wise for them to make on lands, or to the expenses which they may wisely incur for this end. With regard to land and money, labor and produce, it is other-

wise with us. We cannot yet rush into these huge expenses which there are wise. Still, high as labor is here, and high as interest is, there is many an odd acre of bog land, ugly and pestiferous, which might be drained and rendered beautiful and healthy, with a *certainly* of paying double our usual rates of interest in the outlay; there is many an extended marsh, now creating disease and shorting life, which could be reclaimed with a like certainty of paying well; and, if I am not mistaken, there are thousands of fields among us, the whole, or parts of which, might be irrigated, with an absolute certainty of paying such a return for the outlay as should satisfy any reasonable mind.

Amherst, Feb. 12, 1854.

HOW TO CHOOSE A GOOD MILK COW.

J. H. MAGNE, of the Veterinary School, of Alfort, France, has recently published a valuable little work entitled as above. This has been translated in England, and a supplement added by JOHN HAXTON, very good in the main, with the exception of his apocryphal history of the Short-horns and their *improvement* by a cross with a polled Galloway Cow! It is astonishing how ignorant many of the English remain on this subject. *The Royal Agricultural Society Journal*, *The Mark Lane Express*, and other British journals, have for the past few years completely exposed the absurdity of this cross, and far from its being an improvement, shown that it was a great deterioration of all their good qualities, and yet the falsehood of BERRY, as copied by YOUTT, still goes the rounds of nearly every new publication in Great Britain on the subject of cattle. How hard it is to head a great untruth or a stupid absurdity.

With this exception, we can commend the work, though we believe it is not on sale in this country, as we were obliged to import a copy for our own use; and on this account we now commence copying some extracts which we will continue till we have presented our readers all the more valuable portions. We copy in this number the chapter headed

Points Indicative of a Good Cow.

Among practical dairymen there has long existed a number of rules, by which the milking properties of a milk cow are judged of; and as these rules are the results of long experience, transmitted from one generation to another, they contain, when collected together, the sum of all that information which is known by the name of *practical knowledge*. That this knowledge is correct, in a general way, cannot be questioned, because it is the result of actual experiments repeated and confirmed not only for a long period of time, but in a great variety of ways, and under circumstances so different, that any errors must long ere now have been detected. Notwithstanding the existence of these established rules, of judging, by external signs, of the qualities of an animal suitable for the dairy, there are very great differences in the modes and results of applying them practically. Some men have a natural turn or peculiar adroitness for minute and careful observation, which others are devoid of; and consequently the former are far more successful in rearing, selecting, or buying dairy stock, than the latter; and hence, too, we find that to these *instinctive* judges of stock, a glance or a touch will reveal a greater amount of information than the closest inspection of others. While it is necessary, however, that there should be long and habitual familiarity with recognized data in order to their being success-

fully applied in practice, they at the same time furnish a set of rules, a knowledge of which is of very great advantage to those who have been prevented from acquiring an experimental acquaintance with the points to which such rules refer, either by youth or want of opportunity.

The points to be attended to in judging of a good milk cow, are, by universal consent, considered to be shape and size of the animal, both as a whole, and in detail; texture of the skin and hair, development of the lactiferous parts; temperament or habit of body and disposition; and finally, strength or endurance of constitution. A maximum development of these points marks out a first-class cow of the breed to which she belongs; but the milking properties differ in endless variety, not merely as these points are prominent or the reverse, but also in proportion to the circumstances of climate, soil, and treatment. The escutcheon test of M. GUENON, already described in the former section of this work, is a new element in the question; and when fully established, and better understood, will probably occupy the first rank among the external signs which indicate the natural milking properties of cows; but as yet it is rarely recognized in Britain; and there are few farmers, even in the best dairy counties, that have even heard of such a test. How far M. Guenon's observations have been borne out by facts supplied by the examination of a great many dairy cows in our own country, both by the writer and others, will be discussed at the close of this section; meantime, we shall direct the reader's attention to those points which experience has proved to possess a marked influence on the milking properties of cows.

Shape.—Whatever may be the breed to which a cow belongs, there are certain points of configuration which are considered essential as regards her milking properties. There may be, and are frequently, great discrepancies between the one and the other; but still, generally speaking, the rule holds good that, all things being alike, the cow which approaches nearest to a certain standard will be the best milker. The *head* must be rather lengthy, especially from the eye to the point of the nose; the *nose* and *muzzle* should be cleanly cut, and free from thick skin or fleshy lumps; the *cheek bones*, thin, and, in like manner, devoid of thick skin or flesh (not thick chapped); *eye* prominent, of a placid and benignant expression, with little of the white exposed to view. If horned, the *horns* should taper gradually to a point, and have a clean surface, free from rugosities; the breed will determine the shape and set of the horns. The *neck* should be long, thin, and free from loose skin. A good milk cow may be deer or ewe-necked, but never bull-necked. The *chest* and *breast* should be deep, rather than broad, and the brisket should project forwards and downwards; and, whether large or otherwise, should be round, well shaped, and without loose folds of skin depending from it. The *girth*, behind the shoulders, moderate, and arising more from depth than breadth of chest; *shoulders* rather narrow at the top; *back-bone* on a line with the shoulder-top; *ribs* arched, and well home to the haunch-bones, which should be wide apart, and form a straight line across, neither depressed in the center, at the lumbar vertebrae, nor drooping at the extremities; *hind-quarters* lengthy, and the rump, or tail-top, nearly on a line with the back-bone; *thighs* rather thin, but broad, well spread, and giving plenty of room for the udder; *belly* projecting outwards rather than downwards, with plenty of room for food; the *udder* should be large in a lineal direction, that is, well backward as well as upward, between the hind legs and forward on the belly; also broad in front, filling up the space between the lower flanks, but rather short vertically; a deep hanging udder, from its swinging motion, being always the cause of great fatigue to the animal when walking; the teats should be moderately long, straight, and equal in thickness from the udder to the point, and also at considerable and equal

distances from each other; the two front teats especially should be well apart, and the direction of all four should be outward. When full of milk, the udder should be greatly enlarged in size, and, when newly emptied, shrink in a corresponding degree, and the skin gather into soft creases. The *mammary glands*, running on each side of the belly, large throughout their whole course, and swelling into large *puffs* at or near their junction with the udder; *thigh veins* also large and easily felt by the hand.

Of all these shapes the more important are the long, finely-formed *head*; long, thin *neck*; *rump* nearly on a line with the back-bone; broad *quarters*, long *udder* from back to front, and large *veins* underneath the belly, and downwards, from the loins and thigh, to the udder. When seen in front, the body of a good milk cow should present the appearance of a blunted wedge, the apex of which is the breast and shoulder. Seen from behind, she should present a square well-spread shape. Seen sideways, she should be lengthy, but not lanky.

For the American Agriculturist.

SPECIFIC MANURES.

I WAS much pleased and I trust somewhat profited by an article which appeared in your paper of Nov. 3, 1853, headed "How to make home-made super-phosphate of lime." Doubtless, the clan of *Super-phosphate manufacturers* will not esteem it very highly, but be assured it *will be appreciated* by every intelligent cultivator of the soil who reads it. Taking a hint from your remarks I consulted an elementary work on Chemistry, (Youmans') and went to work to see what I could do. I took a small quantity of bones and boiled them in strong lye about four hours; when they were reduced to a powder, and the lye boiled away so as to be nearly dry. Thus I intend to proceed with what bones I can get before planting time. With this pulverized bone I intend to mix gypsum to render it dry enough to be handled with ease when put on. Now, whether this will be as good as it would be if dissolved in the *acid* I am unable to say. What its value as a fertilizer is yet remains to be seen. One thing is certain, if it fails it is not money thrown away upon this or that Prof.'s *concentrated* compound.

I would not by any means undervalue *science* as an aid to the farmer, but would try my own resources first.

I consider it poor-husbandry to neglect the means within my reach for the manufacture of manure, and then buy it at a high price.

S. TENNEY.

For the American Agriculturist.

NEW FARMS LATELY DISCOVERED.

LAWYERS ascertained a long time ago, that landholders owned far down below the surface; but farmers never suspected, that their deeds gave them a right to more than six inches of the surface. Scarcely any have thought of looking deeper than this, except the diggers for gold and water. The sub-soil plow is revealing to agriculturists treasures before unknown. Discoveries in the earth are keeping pace with those in the sky, and a new earth is opening to the cultivator, as a new heaven is to the astronomer. In the soil is a great source of phosphate of lime, which few farmers have hit upon; I mean in that part of the farm which lies more than six inches below the surface. There since the Deluge has lain undisturbed this fertilizer in a hard compact mass. Roots of the grains and grasses cannot penetrate it. There it is and

has been for thousands of years, insoluble, except when roots apply themselves to it.

Not one farmer in twenty ever plows deeper than six inches. The roots cannot get at the mine below for it is too hard. As beneficial as the sub-soil plow has proved to be where used, not one farmer in five hundred uses one throughout the Empire State. You may ask them why this is so and they will answer, our grandfathers never used them, and they generally had great crops, and we think it better to follow their examples, than to be carried away by the silly fashions of the present day.

CANADA THISTLE—DIFFERENT VARIETIES.

IN the 24th No. of the last volume, you ask for an article or two from Western New-York, as to the best means of destroying the Canada Thistle. As I do not belong to that section, I am not called on for a word. I will, however, allude to a mistake in some sections of the United States, as to what plant is really the Canada Thistle.

I have heard several different plants called the Canada Thistle, which are so dissimilar in external appearances and habits, that I doubt their belonging to the same order; certainly they do not belong to the same species. In the State of Maine the plant called "Canada Thistle" has creeping roots, which are exceedingly tenacious of life in every bit cut or broken off. They strike deeper, and therefore are more difficult to kill by digging, and more to be dreaded than the well-known couch grass. The seed, too, is much more troublesome, as no cultivator, however careful, can prevent the winds taking it from a negligent neighbor's land, and gratuitously sowing sufficient in a single year to stock the largest farms of the most guarded farmers. This variety also luxuriates in a clayey soil, and if a chance plant were *well neglected* for a few years, it would be found to have entirely rooted several acres. This underground habit, or mole life, is no small obstacle to be overcome before one can effectually "stop their breath." They have a spine at every angle of stalk or leaf, and so numerous, that one must have a tiny finger indeed, to be able to touch any part without getting a sting from at least one thorn. But for all these bad qualities they have some good ones, for when in bloom they are highly fragrant, and give off in large amount, a very pleasant spicy odor, perfuming the air a long distance around. If cut and well cured when the blossoms are just opening, horses will eat them with much avidity. The seed, too, is the choice food of some of our most beautiful feathered songsters.

In Maryland, there is a plant called the Canada Thistle, that is dissimilar from the above in almost every respect, so much so, that only one of them can properly be called the Canada Thistle. In this section there is a third plant bearing the name of Canada Thistle, which is different from either.

As to the destruction of these plants, I doubt whether it would be necessary to use the same means to kill those of Maryland, that would be requisite to exterminate those in Maine. They may be killed by mowing them off before they blossom, each time they spring up, for a couple of years. I have tried this plan and succeeded. I have also dug them up so as to kill them. This is more laborious, but leaves the soil in good order for a crop.

Would it not be well for every person who speaks of a plant that has a local name, to describe some of its characteristics, so that people of other sections might compare the description with those of their own locality, and so save mistakes which are now frequent, and often lead to serious inconveniences.

I see no reason why the variety of thistle growing in the State of Maine, should be called Canada Thistle any more than Maine or New-

England Thistle, for I have heard many of the "oldest inhabitants" say, that they found the thistle in Maine when it was an entire wilderness from the sea shore to the Canadas, proving to me clearly, that the Thistle was as indigenous to Maine as Canada.

J. H. D.

Morristown, March, 1854.

GUANO ON COTTON.—Mr. BRAHAM, of Coss County, Geo., gives in the *Lawrenceville Herald*, the following account of an experiment of guano on cotton:

The land on which I used the guano, is what in this section of the country we call Hickory Orchard land, the principal growth being thick bark Hickory, with some post Oak and Pine; the color of the soil, dark red, with very little sand. The quantity used was rather less than a sack, which was finely pulverized before using. About three weeks before planting, I had the land listed three feet distance with a large shovel plow, and as deep as a good mule could pull it. The guano was applied immediately, in the ratio of about 250 pounds per acre, and a high ridge thrown on it with turning plows. It was planted on the 18th of April, as was also the balance of the patch (8 acres,) and cultivated in the same manner as the rest of the crop—and now for the result.

"As soon as my crop generally began to show blooms, I counted on the first row, where I had used guano, 40 blooms, and at the same time counted the blooms on the adjoining row, where no manure had been used, and found 9—and now for the seed cotton.

	1st picking.	2d.	3d.	4th.	Total.
Guano row -	12 lbs.	27 lbs.	20 lbs.	17 lbs.	76 lbs.
Unmanured row, 3	12	8½	12½		36

Difference in favor of guano, - - - - 40 lbs.

"I attended the picking and weighing myself, and am sure that the above is correct.

"The rows are 178 yards long, and you will see by calculation that 28 will make an acre, and

76 lbs. multiplied by 28 make	-	-	-	-	2,128 lbs.
36 "	"	"	"	"	1,008

Difference per acre, - - - - 1,120 lbs.

RAISING FOREST TREES FROM SEEDS.

ONE of our subscribers requests us to furnish instruction for raising Chestnut, Walnut, and Locust trees from seeds. This is a subject of much importance to settlers in prairie countries, and even in many other parts of the country, it would be well if farmers would plant a few acres of their grounds with forest trees for the prospective wants of their children, if not for their own benefit. In some parts of the State there is already quite a scarcity of timber for fencing and building purposes, as well as for fuel, and good woodland is worth more per acre than that under cultivation.

The first thing demanded on the part of those intending to plant forest seeds, is to select such kinds of trees as are best adapted to their soil. Much labor has been wasted by neglecting this precaution; and all the instructions we have seen in books and papers in regard to this business have been defective on this point. It has been stated, for instance, that chestnuts can be raised with the greatest ease from seed; and many farmers have been induced to try the experiment, but have very generally failed because their soil was not of the right kind.

A deep sandy and dry soil is requisite for the successful growth of the chestnut; and it is in vain to attempt to make it thrive on soils of an opposite character, as we know from repeated experiments. The Black Walnut and Butternut thrive best in a deep, rich, clayey, and gravelly loam, or what is commonly known as deep limestone soils. The same kind of soil is best suited for the Sugar Maple, but this tree will flourish on a greater variety of soils, and requires less depth than the walnut.

The Hickory will bear a strong clay soil better than most other trees except beech. Neither of these are well adapted to the rich mucky or sandy soils of the prairies. The Oak, in some of its varieties, will flourish on most good soils, not too wet or mucky, but is of too slow growth for our fast people. The Locust on account of rapid growth, valuable timber, and adaptability to various soils, is perhaps the most useful of all—but unfortunately it is so liable to be destroyed by the borer, that it cannot be relied on in many parts of our country.

SAVING AND SOWING SEED.—Chestnuts, Walnuts and similar kind of tree seeds should never be suffered to become perfectly dry before planting. If not convenient to plant them soon after their time of ripening, they should be put in a box of sand, and kept moist, (not wet,) and be allowed to freeze during winter, then planted early in the spring, covering them about two inches in depth. They may be planted where the trees are to remain, taking care to keep the plants clear of weeds and grass while young; or, they can be transplanted when 2 or 3 years old, taking them up carefully, without injuring the roots, and not exposing them to drying while out of the ground.

Locust Seed may be kept dry for a year or two, without destroying its vitality, but it must in all cases be thoroughly scalded before sowing, or it will lie a whole year in the ground without vegetating. For a quart of seed, pour on 4 quarts of boiling water, and let stand for 12 or 24 hours, when most, if not all of the seeds will be swollen to several times their former size. If a considerable portion are not swollen they must be scalded again. Stir the seeds while in the water, so as to agitate them briskly, and while in motion pour off the water and swollen seeds, while the other being heavier will remain at the bottom of the vessel, then scald and let soak as before, and they will generally all swell. The seeds can then be sown where designed to remain, or in a nursery bed, and the trees transplanted when one year old.—*Ohio Cultivator*.

THE POULTRY HOUSE.

As every thing connected with poultry now a days has a peculiar interest, we give the following sensible remarks from an English paper. First, of the roost and nest-house. The floor should be sprinkled with ashes, loam, pulverized peat or fine charcoal, and the floor should be cleaned off every week.

The yard should contain a grass plat, some fine gravel, slaked lime, dry ashes, and pure water. The nests should be lined with moss, heath and straw. Evidently the Dorkings are the best breed; they will lay an average of 185 eggs each per annum. Fowls with black legs are best for roasting, while those with white legs are best for boiling. If you want them to sit early leave the eggs under them. Fowls in their native habits never lay more eggs than they can hatch. Remember that no success can be expected from poultry-keeping if their houses be damp, cold, unclean, or badly ventilated; if their food does not approximate to that which they get in a state of nature, viz., a mixture of animal and vegetable food; if the water they drink be stagnant, the drainage of the manure heap, &c., or if the strongest and hand-somest be not bred from.

VALUE OF ACORNS.—The editor of *The Advocate*, Claiborne, La., has gone into a minute calculation upon the value of one crop of acorns in that parish—equivalent to our counties. He says that 1,800,000 pounds of pork will be consumed there in the year 1854, by the 12,000 inhabitants, and that the whole of it comes from the crop of acorns, and is worth the snug sum of \$90,000. Besides this, he thinks an equal value has been added to the stock hogs. He thinks also that that parish grows \$35,000

worth more cotton than it would, if all the planters had to depend upon the corn crop for their meat, so that the actual value of a crop of acorns is \$215,000.

INDIAN FARMING IN CALIFORNIA.—Lieutenant Beal is prosecuting his labors to establish at the Tejon Pass, California, an Indian reservation and farm. He has already planted two square miles with grain, and has kept running constantly twenty-four plows. Most of the labor is performed by Indians who two months before were running wild on the mountains. He began with sixty, and has now two thousand three hundred.

ARROW-ROOT CROPS IN NATAL.—The extraordinary productiveness of arrow-root in the soil of Natal is illustrated by the fact that, from a plot of less than half an acre, on the estate of Mr. Moorewood, at Compensation, a quantity of the root or tubers has been taken, weighing 12,700 pounds, and this crop has been sold for cash, at 1d. per pound, being upwards of £50 for half an acre! The prepared arrow-root from this lot has been sold in this town at 1s. per pound.—*Cape Town Mail*.

THE FARMER—A PRETTY PICTURE.

THE man who stands upon his own soil, who feels that by the laws of the land in which he lives,—by the laws of civilized nations,—he is the rightful and exclusive owner of the land which he tills, is by the constitution of our nature under a wholesome influence, not easily imbibed from any other source. He feels—other things being equal—more strongly than another the character of a man as the lord of the inanimate world. Of this great and wonderful sphere, fashioned by God and upheld by his power a portion is his,—his, from the center to the sky. It is the space on which the generation before him moved in its round of duties; and he feels himself connected with those who will follow him, and to whom he is to transmit a home.

Perhaps his farm has come down to him from his fathers. They have gone to their last home, but he can trace their footsteps over the scenes of their daily labors. The roof which shelters him was reared by those to whom he owes his being. Some interesting domestic tradition is connected with every enclosure. The favorite fruit tree was planted by his father's hand. He sported in his boyhood beside the brook which still winds through the meadow. Through the fields lies the path to the village school of earlier days. He still hears from his window the voice of the Sabbath bell, which called his father and forefathers to the house of God; and near at hand is the spot where his parents are laid to rest, and where, when his time is come, he shall be laid by his children. These are the feelings of an owner of the soil. Words cannot paint them; gold cannot buy them. They flow out of the deepest fountains of the heart; they are the life spring of a fresh, healthy, and generous national character.—*Puritan Recorder*.

AN UNPARALLELED HORSE.

AN auctioneer in Demara thus describes a horse he put up for sale. This is piling up the adjectives in a style that few Americans can surpass.

A strong, staunch, steady, sound, stout, safe, snug, servicable, strapping, supple, swift, smart, sightly, sprightly, spirited, sturdy, shining, sure footed, sleek, smooth, spunky, well-skinned, sized and shaped, leather colored horse, of superlative symmetry, called SIR TATTON, with small star, and swift, square bodied, slender shouldered, sharp sighted, and steps stately, free from strain, sprain, spavin, spring halt, staggers, strangles, seelling, sellander, surfeit, seams, stumous, swelling, serances, scratches,

splints, scars, sores, scattering, shambling gait, or symptoms of sickness of any sort. He is neither stiff mouthed, shabby coated, sinew shrunk, spur galled, saddle backed, shell toothed, slim gutted, surbated, skin scabbied, short winded, splay footed nor shoulder slipped; and is sound in the sword point and stifle joint. He has neither siek spleen, sleeping evil, set fast, snaggle teeth, sand crack, subentaneous sores or shattered hoofs; nor is sour, sulky, stubborn, surly or slow, sluggish nor stupid; he never slips, strips, strays, stalks, starts, stops, shakes, snivels, snuffles, snorts, stumbles, and seldom sweats; has a showy stylish switch tail, and a safe set of shoes on; can feed on stubs, straw, sage coron or Scotch grass; can carry 140 lbs with great speed and long strokes. Upset price low.

CLAIMS OF AGRICULTURAL PATENTS

FOR THE WEEK ENDING MARCH 7, 1854.

SEED PLANTERS.—L. B. Fisher, of Coldwater, Mich.: I claim constructing the driving wheels of planters with eut rims and divided hubs, substantially as described, said hubs being made to traverse the driving shaft by means of forked levers operated by a screw or its equivalent, for regulating the alignment of the hills in a cross direction, as set forth.

I also claim the scraper in combination with the two pins and the two levers, arranged and operating substantially as described, for preserving a given space between the edge of the scraper and outer surface of the rim of the wheel, as specified.

THE GAUGE OF STRAW CUTTERS.—Warren Gale, of Louisville, Ky.: I claim the arrangement of the adjustable gauge, as described.

OPENING AND CLOSING GATES.—W. G. Phillips, of Newport, Del.: I claim the double span rotating gate opening and closing continually forward, by means of levers and inclined planes, as well as by pulleys and cords, combined and arranged as set forth.

HANGING GATES.—Mr. Ashley Hotchkin, of Schenectady, N. Y.: I claim hanging a gate by means of two lower turning pivots, or pintles, working on separate step projection of a box, or frame, the upper end of the gate being steadied and carried by suitable rollers, (any number) or their equivalent, working or traveling in fixed grooves, channels, or spaces, so as to admit the gate opening either way,—the several parts being constructed, arranged, and operating, as described.

COTTON SEED PLANTERS.—G. W. Cooper, of Palmyra, Ga.: I claim the combination of the saws and feeders, the said saws having a reciprocating rectilinear motion, and the said feeders having a reciprocating rotary motion, the above parts being constructed and arranged as set forth.

APPARATUS FOR OPENING AND CLOSING GATES.—Samuel G. Dugdale, of Richmond, Ia. Additional to re-issued letters, Jan. 31, 1854: the nature of my improvement consists in hanging a pendulous lever provided with a notch, by which I cause the weight of the gate to be the means of holding the bottom to the point to which it is drawn, and at the same time holding the vertical lever down until the carriage has passed over it, thereby preventing any appendages that might be attached to said carriage, or vehicle, from catching said lever.

The application of a pendulous lever provided with a notch, or its equivalent, as set forth.

Re-issue.

GRASS AND GRAIN CUTTING MACHINE.—William F. Ketchum, of Buffalo, N. Y.: Original Patent dated Feb. 10, 1852, I claim, first, sustaining the outer end of the rack piece in the manner set forth.

The shield plate in combination with the shoe and cutter bar, for the purpose aforesaid.—*Scientific American*.

Horticultural Department.

TO HORTICULTURISTS. — Our weekly issue of so large a journal, gives us ample room to devote to the different departments of cultivation, and we have commenced with this volume, to allot a separate space to Horticulture. We have secured additional efficient aid in its conduction, and we invite horticulturists generally, to send in their contributions on all subjects interesting and instructive to those engaged in similar pursuits with themselves. We are receiving the leading foreign and domestic horticultural journals, and shall be abundantly able to bring promptly before our readers all that transpires, which may be new and useful.

EARLY SPRING WORK IN THE GARDEN.

FIRST, remove all litter from the garden, together with all undecomposed manures, except such as are needed for mulching. We would be very careful not to allow manure at any time to become incorporated in our garden soils, except such as had been completely composted, unless in stiff soils.

Do not disturb the soil until sufficiently dry, then spade it deep, and thoroughly pulverize it. As soon as may be, sow radishes, lettuce, onions, beets, and plant early potatoes and peas. After experimenting with almost every variety of peas, during the last five years or more, we prefer, all things considered, for an early pea, the Early Emperor and Prince Albert; for the best pea a little later, the Champion of England; and later still, the best and most productive of all peas, we think is Hail's New Mammoth Dwarf Marrow. The *London Gardeners' Chronicle*, in its reports for several years past, has given this pea the decided preference there. So it has also repeatedly proved here. None of these peas grow vines higher than about two and a half feet, and we very much prefer them to Stanley's Marrow, or other four to six feet varieties.

Put your strawberry beds in a good condition, but leave on the ground all the clean litter you can without incommencing the plants. They need thorough mulching, and this will assist in so doing. A friend, who is a successful cultivator, writes us, strongly recommends the following treatment:

"When the growing spring weather fairly commences, take a pound each of sulphate of potash, soda, and (Glauber salts,) and one quarter pound of sal-ammonia, dissolved in six gallons of water, and water freely every strawberry plant just at evening. Continue this every tenth day until the blossoms appear, and then apply pure water freely every dry day until the season passes by, and you will probably receive a larger quantity, and larger strawberries, than you have been accustomed to see."

This is also the time to prune your rose bushes, and most varieties of shrubs and young trees. Prune freely, and have an eye to the comely shape of the tree or shrub after you have done with it. We would not allow an ill-shaped tree, nor a conspicuous crooked limb to deform any tree, shrub, or plant in our garden. If our city fathers had attended to this simple thing, those noble trees in the park fronting our City Hall would not present such deformi-

ties. Nature never puts on foliage in that way, as the noble elms and maples in our country towns, where they have been allowed to grow unmolested, abundantly verify. Even the apple and Peach tree should be trained to grow of beautiful form. A very little taste and care will accomplish it.

We wish men fitted to the task, would go over our whole country, giving lectures to all the people on the important and delightful art of pruning.

HORTICULTURAL SOCIETY OF MASS.

COMMITTEE ON FRUITS.

A FEW weeks since, we received the Annual Report for 1853, of this excellent Society, which centers in and radiates out from Boston, but we have not found time till now to give it a thorough examination, so as to present to our readers a synopsis of such of their doings as are of general interest. The results of the year's labors of this Society are of peculiar interest at the present season.

The committee on fruits during the past year, awarded the first premium on summer apples to William's Favorite. The best autumn was declared to be Hubbardston's Nonsuch. The best winter to be the Baldwin, while at the Annual Meeting the first premium was awarded to the Gravenstein.

Rostiezer bore off the first premium for summer Pears. Beurre Bosc or autumn, and Easter Beurre or Winter Pears, while at the annual meeting, Flemish Beauty was declared the best dish, Seckel the second, Louise Bonne de Jersey third, and Dunmore fourth.

The first Premium on Currants was awarded to the Red Gondouin. On Peaches, to the Early Crawford; on Plums, to the Green Gage; on Strawberries, the first and second premium, to Hovey's Seedling, and the third to a new seedling called Durfee's Seedling, of which the Committee say, "It is of a rich sparkling flavor, with berries of an extra large size." A gratuity was also awarded Mr. J. FAY, for "numerous baskets of his seedling strawberry 'Jenny Lind,' said by the producer to be quite productive, of good size and fine flavor. Should it continue to maintain the character of productiveness it will prove a desirable variety."

A large premium of twenty dollars was awarded to N. COLLINS, for the introduction of the "Collins" Pear; and the same to Messrs. Hovey for their new Seedling Pear, the "Boston." They also awarded the Appleton Gold Medal, valued at \$40, to Messrs. Hovey & Co., for their new Seedling Cherry, the "Hovey."

The committee remark that "the only variety of apple worthy of particular note, exhibited the past season, was the 'Size,' a seedling from W. A. ANDREWS, Dover, N. H., (by Messrs. Hovey & Co.,) of which a few dozen were offered, and of so rich a coloring as to prove a great attraction in the fruit department. On testing it, 21st May, it proved abundantly juicy, and of a rich flavor. It is a late keeping variety. In size it is above medium; a high warm, rich red on a yellow ground; deep red to the sun, and for its great beauty *alone*, must prove a desirable table fruit." Mr. M. P. WILDER, exhibited twenty varieties of strawberries from imported vines, of which only three were considered by him as worthy of cultivation; among which was "Barnes' New Large White, which, as exhibited,

certainly proves to be the largest and finest of the white varieties."

Of Raspberries, the committee say the best exhibition "decidedly, has been made with Knevett's Giant." In a future number we will refer to other reports of this Society.

REVIEW.

ELLIOTT'S FRUIT BOOK; or the American Fruit Growers' Guide. C. M. SAXTON, New-York.

Our first general impression of this book is a favorable one. There is an air of independence and freshness about it which is decidedly agreeable. Besides it is from the West—the great, the growing West. The movements in Fruit Culture, and Fruit Books in our country during the last few years are of a remarkable character. Not to mention KENRICK COLE and others, we may rank first in importance DOWNING'S Fruits and Fruit Trees of America. Next appeared that accurate work of THOMAS, the Fruit Culturist, after which we received BARRY'S Practical Fruit Garden embracing minute description of the best mode of cultivating those garden gems—dwarf fruit trees—and now here comes another work more on the general plan of DOWNING, and yet distinct and improved somewhat in its arrangement.

We are glad the Buckeye State has spoken so emphatically on this subject.

Of course the experience of cultivators at the east will somewhat differ from the western description of some of the fruits, yet this renders the work only the more valuable to all, for comparison.

The work evinces a good degree of labor, and deserves a large circulation, especially at the West. We shall recur to it more critically at an early period.

SETTING OUT TREES.

ON the opening of early spring, a large proportion of our readers are particularly interested in any plain, simple directions as to the best manner of setting out trees, and especially so, where in that way, common and fatal errors are easily avoided. Let us therefore suggest

1. Do not set them too deep. This is the secret of the grand discovery of the great law of vegetation, for which RUSSEL CONSTOCK asked the small sum of one hundred and fifty thousand dollars, viz.:

"That the 'seat of life' in a tree or plant is just at the point where the earth should cease to cover the foot of the tree. If covered deeper it strangled the tree at said seat of life, or forced it into sending forth suckers, which stifled all healthy progress in the tree."

Now, the discovery is not a new one, that trees must not be too deeply planted; certainly no deeper than they were, when growing in the earth previously. Without doubt thousands of dollars, worth of trees are annually lost to our country by this simple error.

2. Put nothing but pure and finely pulverized earth around the roots. Many persons are told their land wants manure, ashes, &c., and not having time to manure and ash their whole field, they, as a substitute, put these substances into the hole for the tree, and mingle it in the earth with which they cover the roots. This is all wrong. The soil may need manure and ashes, but these should be completely com-

posted in the soil before allowed to come in contact with the fibrous roots of the young trees.

3. Mulch the tree well after setting out. Mulching consists in placing the manure—be it new or old—leaves, tan-bark or whatever is used, loosely on the surface of the ground for a considerable space around the tree. On no account mix it with the soil in transplanting.

4. The first step, and most important, in preparing for a fruit yard, is thoroughly to drain the soil. The tree cannot be healthy and vigorous without this.

5. Take care of the tree after setting it out. Many persons do not bestow as much labor on a tree, which ought in ten years to yield an income of, ten dollars per annum, as they do on a half dozen hills of potatoes. They do not seem to be aware how great the difference is between the quantity and quality of the fruit on a kindly treated, well-fed tree, and that of one half starved and dwarfed. Let it be always remembered, that whatever is worth doing at all, is always worth doing well.

THE CRANBERRY.

Continued from page 6.

THE mode of setting out the cranberry in such a swamp, if we suppose it to be covered with bushes and grass, and surrounded by a sandy soil, or in the immediate neighborhood of sand, would be as follows: First, cut the bushes and pare off the surface turf to the depth of several inches, so as to remove, as far as possible, the roots of grasses and bushes; then level the whole by filling in sand to the depth of from two to four or five inches, according to circumstances. It is desirable that the surface of the sand should be but slightly raised above the level of the water of the swamp, meadow, or pond filled up, so that, by digging into the sand with the hand or the hoe, the water may be found within two or three inches of the surface. The plants should be taken up with the spade in square turfs, of the thickness of two or three inches, this being the depth to which the roots generally descend. When the ground has been leveled and prepared as directed above, it will be found more convenient to draw straight lines and set the roots about eighteen inches apart one way, and one foot the other, in small clusters of about five or six together, the grasses taken up with them in the turf having first been removed from them. The practice of some has been to set the turf, thus taken up, into the row without removing the grass; but the vines are so tenacious of life that there is little danger of their dying, even if all their natural earth is removed from the roots; and those who have followed this method have generally had much less trouble in the subsequent cultivation. Some prefer to set them in rows, at a greater distance apart, having the rows two and a half or three feet, and the plants one foot, in the rows. The distance may be regulated, somewhat by circumstances. If the sand is thick and loose so as to make it impracticable to cultivate the vines and pull up the grasses and weeds, on account of the danger of starting the roots, the closer the plants are set, the better, since they will thus the sooner cover the ground and get the advantage of the grasses. Where it is not intended to hoe the plants in such situations, a foot each way will probably be the most convenient distance between the plants.

Many fields which I have seen, are thus arranged. Swamps like those described, which have always been considered as entirely incapable of improvement, have been reclaimed in many instances, with great labor, and filled up with coarse, white beach sand, and often, where the swamp has been covered with water, to the depth of three or four feet. The plants have then been set out in the manner described, from one foot to eighteen inches apart, in holes made

in the sand by a small stick, hoe or dibble, and sometimes with the hand; a small cluster of roots taken from the sod in which they had been taken from their natural position, freed from grass and roots, being placed in each hole. In such a situation there will always be moisture enough for them.

The cost in these cases varies from \$100 to \$400 per acre. Under the most favorable circumstances, I have never known an acre prepared in this way, to fall below \$125; and that, too, even where it has been prepared in the most economical way, all the labor being performed by the owner himself. The cost, in the situations described, including the original preparation by paring, fencing, filling up with sand, procuring and setting out the roots, has more frequently been about \$300 per acre. In many cases within my knowledge, the owner has contracted to pay at the rate of \$1 87½ a square rod for preparing the land and setting out the plants properly. In somewhat more favorable situations, the contractor pays \$1 50 a rod, or at the rate of \$240 per acre.

When the roots are thus transplanted, a foot or a foot and a half being left between them, they are expected to spread and entirely cover the ground with vines, in about three years. If the plantation is troubled by grasses at first, the rapid growth of the plants will generally destroy them in the course of three or four years. In one of the most successful cases which have come under my observation, where the plants have been set about six years, the quantity of grass and weeds was much less the last season than the preceding; the vines produced abundantly, and there seems to be every reason to suppose that the cranberries will very soon take full possession of the ground. But if they are set sufficiently near, and have a proper amount of labor bestowed upon them, they will ordinarily, on sand, get an early hold of the ground, and bid defiance to all opposition.

In some swamps and peat meadows, generally denominated "shaky," the surface is composed of a matting of roots, mosses, and various undecomposed organic matter; the whole of which seems to rest on a liquid, or almost liquid, bed beneath. This top matting may be thick and strong enough to prevent a person walking over it, from falling through. In such cases, the surface cannot very well be taken off, and the sand must be put upon the top; but careful consideration should be given to the quantity used, as, if too much be put on, its weight may sink the whole surface into the water beneath. Two or three inches will commonly be found as much as it is prudent to use. I have seen several examples where a neglect of reasonable precaution, in regard to this matter, has cost the owner the loss of all his labor and expenditure.

The mode of treatment which has been described, will be found to be the best for swamps surrounded by large quantities of sand; and experiments, extending over a term of seven or eight years, with plants every year becoming more and more productive, show conclusively, that cranberries will flourish in pure white sand, if they are supplied with sufficient moisture.

If the position be a peat meadow, substantially the same course should be pursued. If very moist, it would, perhaps, be well to arrange suitable drains; and if these drains could be so constructed as to make it possible to flow the plantation in a very short time, it would, at times, be highly beneficial in preventing frost. The surface should be pared, the turfs being sometimes taken off and piled up for the compost, and sometimes turned directly over and left on the ground. As to the next step, in such cases, there is great difference of opinion, some preferring to cover the whole with sand—or gravel, if sand cannot be had—and others, to put the vines directly upon the peat bottom. The black soil, it is thought, is very useful in securing sufficient warmth in spring and autumn, as a protection against frost. This point has not been fully settled by experiment, so

that it is impossible to say positively, that the one course or the other is the better. So far, however, all things being taken into consideration, the weight of opinion seems to be in favor of the former course,—covering to the depth of three or four inches with sand, or, where sand cannot be obtained, with gravel. This method very much diminishes the labor of hoeing, if it be found necessary, where the roots of grasses or bushes are left in the peat. Most cultivators prefer to hoe a little, sometimes twice or three times the first and second years after transplanting, or till the vines have trailed so as to make it inexpedient. The objection to transplanting in pure peat bog without sand, does not arise from the nature of the soil itself, which is, perhaps, as favorable, or nearly so, to the cranberry, as sand; but rather from the cause alluded to—the difficulty of hoeing, if the plants require it, when set in peat. The cranberry seems to have a wonderful power of adapting itself to any kind of soil; it draws its nourishment mostly from the atmosphere, though a liberal supply of moisture is desirable.

A somewhat simpler mode of procedure is sometimes adopted in the case of ordinary low meadows or swamps in the country. If the meadow is covered with bushes and bassocks, the former are cut and the roots taken up with the grubber, and the latter are cut off level with the surface, when the vines being taken up from another part of the meadow or elsewhere, are set by first striking a hoe into the soil and raising it slightly when the roots are inserted, and pressed down with the foot. In this way, a large space may be quickly set with vines, which, under favorable circumstances, may cover the ground in three or four years. This method, it is evident, requires but little skill.

I have never seen more than one or two plantations with the roots set in the mud alone. In these cases, the soil had settled around them, leaving the plants standing on the ends of the roots, nearly out of the ground. So far as can be judged from appearances, they were by no means likely to grow; while close at hand was a piece covered with sand, on which the vines were very thrifty, with not a sign of failure. The mixture of sand had given the surface more consistency, and the plants had become well rooted and strong.

The experiments which have already been made, clearly show the practicability of raising cranberries on upland. I have seen flourishing plantations of them on all varieties of soils, from a high and light gravelly loam, to a very deep, rich, garden soil. Indeed, the universal opinion seems to be, that such cranberries are better than those growing naturally in wet meadows. In the instances which I have myself seen, the land had been carefully plowed and prepared, as it usually is for strawberries, or plants of that description. The plants were taken from their original situation in the manner described, in the sod, and freed from grasses and roots; they were then put into shallow trenches or drills dug for the purpose, about two and a half or three feet apart. In consequence of the large space left between the drills, constant and careful attention was necessary for two or three years, so that far more labor was spent on them than the same area of strawberries would have required.

In one case, the plantation was situated on a high and dry hill, in a light loamy soil, and no water was supplied except what they had from occasional rains. The vines nearly all lived; but as the plantation was only three years old, and the rows too far apart, they had not wholly covered the ground, nor had they borne to any extent.—*C. L. Flint's First Annual Report to Massachusetts Board of Agriculture.*

Forty thousand hog's bladders were sold a few days since at Louisville, at 2½ cents each, to fill an order from Europe. They are used to hold snuff, and for other purposes.

American Agriculturist.

New-York, Wednesday, March 22, 1854

BOUND VOLUMES.—We have a few ets (26 numbers) of volume eleventh, bound and unbound. The price, at the office, of the unbound volumes is \$1.00. The bound volumes are neatly put up in cloth covers, gilt backs, at \$1.50.

We can also furnish the covers separately, gilt and all ready for putting in the paper, for twenty-five cents each. With the covers thus prepared, any bookbinder can complete the binding for twenty-five cents. Volumes sent to the office will be bound complete for fifty cents.

We are having printed a new edition of the first ten annual volumes of the monthly *Agriculturist*, which can be supplied for \$1.25 per volume or \$10 for the set of ten volumes.

ACKNOWLEDGEMENTS.—We are indebted to WM. DUANE BARNES, of Middletown, Ct., for a copy of the annual address before the Middlesex County Agricultural Society, by Prof. W. C. FOWLER.

We are also indebted to some unknown friend, for a copy of the Transactions of the Michigan State Agricultural Society for 1852. There seems to be some error in the date, as several of the articles are dated during 1853. We have laid the report upon our table for a more thorough examination.

GUANO ON CORN.

THE *Genesee Farmer* says, "whether it is on the whole better to sow guano broad-cast over corn ground, or use it in the hill, is still an open question."

We can assure the *Genesee Farmer* that if this be an "open question" in Rochester, it is not so in all other places. The farmers in the vicinity of New-York have used guano for the past nine or ten years, and in every instance which has come to our knowledge during this time, of their applying it in the hill, from ignorance of its caustic nature, they have lost their crop. We have made repeated experiments ourselves with guano—thus applied. Covering it several inches deep with earth before planting, and yet it invariably killed the corn. The only safe way of applying guano is as recommend in our last number, page 8.

The *Farmer* says "moisten with water, and crush the lumps with the back of a hoe."

It is much better to crush the lumps dry with a heavy wooden pounder upon a floor, then pass through a sieve till the whole is made fine.

Again the *Genesee Farmer* says, "A trifle (of guano) taken up between the thumb and fingers, is a dose for a hill of corn."

We regret to see such advice as to quantity, in so respectable an organ. Unless the land be very rich, a table-spoonful at least ought to be applied around each hill. This would be about 200 or 250 lbs. per acre; and many apply from 300 to 500 lbs. per acre with good and economical effect. Very poor land requires the latter amount for corn.

The same article speaks of "guano and wood ashes mixed with the soil." If unleached wood ashes are mixed with guano, the tendency would

be to liberate the ammonia, and the guano would thus lose its most valuable element.

We have not adverted to this article for the purpose of finding fault, but to guard those who use guano, against what we think would be injudicious practice.

SPRING WHEAT.

THERE are several inducements to lead farmers to use every available acre for raising Spring Wheat. This crop is not always as certain or as valuable as the winter varieties, yet it may be safely put down as one of the most profitable crops that can be sown the present spring. A few hints as to its cultivation may be valuable.

Soil.—The soil should be as warm as possible; the short season allowed for growth and maturity requires a genial soil. If the season proves favorable, spring wheat will do well on cold clay lands, but the chances are better for that sown upon a dry, warm, loamy soil. If the land was plowed in the fall, and has been exposed to freezing and crumbling in the winter, so much the better. Such land is ready for sowing without the further use of the plow. Where the sub-soil is not poisonous, deep plowing is very desirable, as it will be better penetrated by the warm air. Let a part of a field be sub-soil plowed, and we can almost guarantee that the yield will be much greater, than on that part of the field which has received only the ordinary treatment with the common plow.

Kind of Seed.—It may not always be convenient to procure the best seed. Get the kind most available, which has been tried and proved in your vicinity. The Black Sea is not of so good a quality as many others, but in consequence of scarce by ever being attacked by the fly, it is highly prized. There are two varieties of this, the red and the white chaff. The red is generally preferred because most hardy. The white produces the best flour. The flour of the red is usually of a dark color, but it is sweet, and as palatable and nutritious as the white variety of winter wheat; and although it may not bring as high prices in the market, it is equally good for home use. There are other varieties of spring wheat which are of a superior quality, though probably not equal to the Black Sea in resisting the fly, such as the Siberian, Italian, &c.

Time of Sowing.—Spring wheat should be sown either quite early or somewhat late. That sown early comes to maturity before the appearance of the fly, and that sown late does not get to a fit state to be attacked, till after this pest has ceased its ravages. The best plan is to put in the seed, if possible, as soon as the ground will answer to be worked, and if it cannot be done then, to delay several weeks.

Sow spring wheat where the winter variety has been killed out by frost.—We have found it quite profitable to sow spring wheat upon fields, or parts of fields, where the frost has killed out that sown in the fall. The ground needs no preparation. The cost of the seed is trifling compared with the loss of the use of the ground. Our plan is to go over the field, and wherever there are a few square rods more than half killed out, scatter on the spring seed, and then go over it with a hoe or light harrow. Usually, at harvest the winter wheat will ripen a little earlier, and in harvesting the patches of the spring

variety can be left to be cut afterwards. The winter wheat mingled with the spring, will not be entirely lost, even if it stands a few days till the other ripens. We have often had both come to maturity at the same time.

For the American Agriculturist.

A SCORE OF QUESTIONS.

1. WHAT is the best plan of a barn for twenty head of cattle, whether with stanchions or stalls?
2. The best way to make stalls for horn cattle?
3. How to prepare land for all sorts of roots, so as to raise a good crop?
4. How to manage them throughout?
5. Which kind is the most profitable?
6. Are Crowel's churns a good sort?
7. What sort of a weed is chess?
8. What is murrain and hoven in cattle?
9. What are the symptoms and cure?
10. What are all the names of diseases that cattle and horses are subject to, with symptoms and cure, if space will allow?
11. Do you know any remedy for the wheat midge in wheat?
12. What kind of sheep are the best for this cold climate? and (14) where they can be had nearest here? and (15) at what price?
16. What is a good bread recipe?
17. Is rolling land beneficial?
18. Is the clod-crusher a useful instrument or not?
19. Will winter wheat do to be sown in the spring?
20. What is the price of turnip-cutters, and do they cut them in small pieces or slices?
21. How many bushels will they cut in an hour?

MANOAH STEVES.

Lower Coverdale, New-Brunswick, March 2, 1854.

We publish the above series of questions as a sample of many that are frequently sent us. It affords us great pleasure to answer all correspondents when their questions come within a reasonable compass; but to reply in full to the above, and others received by us the past month, would require the republication in our journal of a large agricultural library, which would be an injustice to most of our subscribers; as they expect our columns to be more particularly occupied with the topics of the season, and the current agricultural matter of the day. We beg respectfully, therefore, to say to our correspondents, that they will find most of their questions fully discussed and answered in the back volumes of the *Agriculturist*, in the *Farmer's Encyclopedia*, *Youatt's Works on the Horse, Cattle, Sheep, and Swine*, *Allen's Work on Farm Buildings*, ditto. *Book of the Farm*, ditto. *Domestic Animals*, and sundry other works too numerous to mention. These volumes may be had for various prices, from 50 cts. to \$3 each. We will give a list with prices in a future number.

We will now answer such questions of our correspondents as books cannot do so well.

Quest. 6.—The Crowell churn is upon the whole considered the best with us, as it gathers the butter after it has come, which no other churn does so well.

Quest. 11.—There is no remedy for the wheat midge, except by getting a new variety that ripens earlier or later than the sort you now cultivate. We have known much benefit derived from burning the stubble soon after cutting the wheat, and especially the grass in the fence corners, since this grass serves as a harbor for the insects, which is proved by the fact that the strip of grain around the outside of the field is usually much more injured than that in the central portions. It seems a pity, however, to burn up what might otherwise add to the fertility of the soil, if it can be avoided.

Quest. 12.—If you desire wool, the Merino sheep is the best; if mutton, the Long-wooled

or the South-down. There are plenty of these in Upper Canada, Vermont, and New-York. The price varies from \$5 to \$500, according to breeding, quality, &c.

Quest. 13.—Our last volume contains several good recipes, and we shall introduce others as occasion requires.

Quest. 17.—Yes; especially if it be a light soil.

Quest. 18.—Yes.

Quest. 19.—No, not for profit.

Quest. 20.—Twelve dollars we believe is the usual price. They cut in sufficiently small pieces. Driven rapidly it will cut 60 bushels an hour, but worked by hand, if the machine cuts fifteen or twenty bushels an hour it is getting along pretty well.

For the American Agriculturist.

THE COMPOST HEAP.

WILL you be good enough to inform me whether lime mixed in a compost heap, consisting of two-thirds green stable manure and one part loam, will injure the manure. I know that quick or slacked lime brought in contact with green manure, liberates the ammonia and spoils it; but whether the loam would catch the ammonia and thereby obviate this difficulty, is a matter of which I am ignorant. My object is to shorten my long manure by rapid decomposition, in order to mix it more perfectly with the soil. Long manure we cannot bury sufficiently with the harrow or plow, on sod ground. What effect will oyster-shell lime have in a compost heap? This ingredient can be obtained at less than half the cost of stone lime, and on this account would be preferable. By enlightening me upon this subject you will greatly oblige B. S.

Woodstock, Ct.

We are quite certain that one-third part of common loam would not be sufficient to retain the ammonia and other gasses escaping. The best peat or swamp muck in so small proportion would not be sufficient for the purpose, unless it should have been very recently subjected to a strong heat, (with the air excluded,) so as to make it like newly-burned charcoal, and even then it would have to be kept dry upon the surface. Many would-be-chemists are publishing a great deal about the wonderful absorbing powers of muck. They compare it to charcoal in this respect. It should be remembered that old charcoal, which has lain exposed to the air, has its pores already filled, and is no longer an absorber. It is similar with peat, or muck, which is a species of charcoal, though differing much from it.

When speedy decomposition of manure is desirable, it is better to mix some muck or loam and lime with it thoroughly, then cover over the heap with a good coating of muck, or even loam, incorporated with a quantity of plaster, (sulphate of lime.) This outer coating of muck and plaster, if kept moist, will effectually absorb the escaping gasses. A few days before using, it will be well to mix over the whole mass. Such a compost cannot be otherwise than valuable for almost any crop.

Newly-burned shell lime is preferable, even to the common stone lime, for the compost heap, or for land, because all kinds of shells contain more or less phosphoric acid, which is a great desideratum for nearly every class of soils, and for old fields especially. Usually shell lime is a little less caustic than good stone lime, and a trifle more is needed for composting effects, but this is much more than counterbalanced by the valuable phosphate it contains.

CHANCES FOR EDUCATED MEN.

UNDER this head the *Tribune* gives some very wholesome advice to attorneys and doctors, most of which we approve, though we must add a word of caution. The *Tribune* says, "Qualify yourselves at college to enlighten farmers and mechanics in the scientific principles which underlie their several vocations." This is all very well; but in respect to enlightening farmers we will add, qualify yourselves out of college also. We pursued the usual collegiate course, and afterwards passed three years with one of the best scientific instructors, in the in the special study of the science of agriculture, and yet we should feel very incompetent to instruct farmers, had we not for many years been actively engaged in all the various details of farm work. We would advise no one, however thoroughly versed in science, to undertake the business of instructing farmers, if he has not at some period in his life, passed a few years at least, upon the farm.

As well might one study the mechanical principles involved in blacksmithing, and then, without even looking into a smith's shop, call together the blacksmiths of a neighborhood, and attempt to instruct them in the principles and practices of making horse-shoes and ironing wagons, as for a man who had passed all his previous life out of sight of the farm, to attempt from book-knowledge alone, to teach farmers how to till land, take care of stock, &c.

Let us not be misunderstood in this matter. We do not ignore the assistance which science may and must render to the farmer. On the contrary, we believe that the application of science to cultivation will soon double the product of labor in this department, but we would advise those who have been educated in schools only, to be cautious how they attempt to instruct practical men.

There are at the present time, a large number of young men in our colleges, who have grown up on the farm, and are familiar with all its practical details. They have left their former occupations with the hope of bettering their condition by engaging in professional pursuits. To such we say, turn your attention to the science of cultivation. Learn well the principles involved, and by study and observation fit yourselves to communicate sound, practical instruction to cultivators of the soil; there is then a wide field open before you, a field which promises well to yield emolument and honors. Do not follow the example of those, who have suddenly changed from mechanical and professional pursuits, and have announced themselves as professors and teachers of agriculture. They have, by dint of plausible theories, and by the skillful use of a little smattering of superficial knowledge, been able to gain some notoriety, while the science of agriculture is in its infancy, and others are perhaps as ignorant as themselves; but their teachings have been looked upon as something strange and startling, rather than instructive. Their blunderings are daily becoming more and more apparent, and they will soon sink into merited neglect and oblivion, while a better class of teachers are springing up to occupy the field; men who, if rightly prepared for their work, will rise to high stations of honor and usefulness.

The article alluded to in the *Tribune* contains

several good hints, and we transcribe it entire. It is as follows:

"E." writes us from Cambridge, Mass., that he has read with interest our advice to young Farmers and Mechanics as to various locations in the West, and he writes to know whether we can give any useful and cheering counsel to the scores of educated young men—mainly embryo Doctors and Lawyers—who cluster within the shadow of Harvard, as of other universities.

We cannot, indeed, point young Attorneys and M. D.'s to Western localities in which they will find clients and patients anxiously awaiting and ready to welcome them, as there are lands in abundance awaiting the farmer, and customers ready to fill with orders the shop of the newly-arrived mechanic. There is probably no growing village of twenty houses or more in the West; which has not at least one lawyer and one doctor—many such have two or three of each. How they all live is a mystery, yet they do live, somehow; for though some of them are driven by desperation to steal, and many to cheat, we have not yet heard that even one of them has been doomed to starve. Ultimately, the more energetic, capable, frugal and temperate, secure a good practice and acquire a competence; yet it is an even bet to-day that there would be quite as much justice and health in the West if no new lawyer or doctor migrated thither for the next ten years, as there would be if the present ratio of migration were doubled.

Still, lawyers and doctors are necessary, since men will not obey the requirements of Justice and the demands of Health, and quite as necessary at the West as elsewhere. The best will ultimately thrive there, if they can manage to keep starvation at bay for the first few years. But how shall they do this?

Our advice would be—*Qualify yourselves at College to enlighten the Farmers and Mechanics among whom you may settle, in the scientific principles and facts which underlie their several vocations.* The great truths of Geology, Chemistry, &c., &c., ought to be well known to you when your education is completed, and these, if you have the ability to impart and elucidate them, will make you honorably known to the inhabitants of any country wherein you may pitch your tent, and will thus insure you a subsistence from the start, and ultimately professional employment and competence. Qualify yourself to lecture accurately and fluently on the more practical and important principles of Natural Science, and you will soon find opportunities, auditors, customers, friends. Show the Farmer how to fertilize his fields more cheaply and effectively than he has hitherto done—teach the Builder the principles and more expedient methods of Heating and Ventilation—tell the Mason how to correct, by understanding and obeying Nature's laws, the defect which makes a chimney smoke at the wrong end—and you need never stand idle nor long await remunerating employment.

But we are not telling our friend where to look for a promising location. No—we have only attempted to tell him how to *deserve* such a location. Let him do this, and his success is all but inevitable, let him settle in whatever thrifty, growing section he may choose. Ohio is not too near, nor Oregon too far for men of the right stamp; and for others we know not how to prescribe.

PROBABLE PRICES OF CORN.

To those interested in grain and flour, we recommend the perusal of the following candid and well-considered article on Bread-stuffs, which we take from the last *London Shipping Gazette*, just received by steamer.

There is no doubt but grain will bear a good remunerating price for the year to come; and we advise the farmers and planters to get in all the Spring wheat, corn, barley, oats, peas, and beans which they can well cultivate the present

season; and not to neglect their grass and root crops, for these also are excessively high now.

The approaching war cannot fail to affect our supply of grain; but we would guard against the attempt that will in all probability be made, by interested parties, to raise the price beyond what the occasion warrants. England will probably lose a great part of the supplies which she has hitherto drawn from Russia direct, and from the corn countries of the Mediterranean and Black Seas, which are, or which may come under the influence of the Northern usurper; but we are much mistaken if it is an event to "fright the isle from its propriety," and it would be a source of regret if it should be turned to such an unrighteous purpose. America, as well the British provinces as the United States, will still be the providore of England, as it has been for some years past; and the supplies which we shall draw from thence, as auxiliary to our own produce, and that which we shall receive from other sources beyond the reach or influence of Russia, must prevent any thing like scarcity or inordinate prices.

A return which has been laid before Parliament, within the last few days, is somewhat consolatory on this head. The quantity of grain, meal, and flour which we received from the United States, in 1852, were equal to 1,400,558 quarters, converting meal and flour into the equivalent in quarters of grain; from Egypt 775,745 qrs., Denmark 770,196 qrs., and Prussia 554,742 qrs. From Russian northern ports, England received in the same year 343,948 qrs., and 957,877 qrs. from the Black Sea ports. From Wallachia and Moldavia, we also received 713,877, quarters, a source of supply which we suppose will be no longer available, at present. On the whole, then, we may calculate on losing about two and a quarter millions of quarters of grain by the approaching hostilities. We have, however, every reason to believe that cultivation has greatly increased in the United States since 1852, consequent on the number of immigrants arrived there from the British islands, from Germany, and other parts of Europe; indeed, the official account of the sale of land which has taken place in the United States; and brought under cultivation, since 1852, would fully warrant us in believing that instead of one and a half millions of quarters of grain, which was the supply from thence in 1852, it will, in the present year, reach about double that quantity. But, besides the United States, we know, on authority which we have no reason to doubt, that our own North American Colonies are progressing in the raising of corn of all kinds, more especially wheat, in a most astonishing manner; and it is not going too far to say that we may expect, from this source, a supply which will be double the quantity ever exported to England.

Turning to our own agricultural prospects, as the surest source of dependence, there is every reason to expect that the supply will be much in excess of what it was last harvest. Last season was one of the worst we have had in England for many years; the quantity of rain which fell in the beginning of the year, prevented much of the land being plowed and prepared for spring seed, and what was sowed was materially injured by the wetness of the season. Indeed, the general calculation is, that the crop was about one-fourth deficient in yield compared to the ordinary average; while we have reason to believe that, both in England and Ireland, the prospect of war will induce much more land to be put under crop this year than heretofore. In Ireland especially, we know that, last year, tillage was much neglected, as it was considered rearing and feeding cattle for the English market would pay better. It will now be of the greatest importance to attend to our own corn crops in these countries, and we are confident that, if it be done, any deficiency in the Russian supplies of grain will be amply compensated by our own produce, and the quantity we are likely to receive from other foreign countries. The present season has hitherto been most propitious for preparing for the spring

crops; and from all parts of the country, we learn that the winter frosts, and the dry and favorable weather during the early spring, have been attended with the greatest benefit to the land. Indeed, from all appearances at present, we may anticipate an abundant harvest, should the summer and autumn prove favorable.

We would disabuse the public mind of the impression that a war with Russia will necessarily produce a scarcity of bread corn in England; we think that we have shown that such a result by no means follows, and that any attempt to raise prices, under this plea, will merely be the act of speculators and jobbers. Fortunately, England is perfectly independent in all its resources; and it is a proud and satisfactory position for a country to be placed in, that, while it does every thing in its power to eschew war, it is always prepared to meet it without apprehension for the consequences.

THE JAPAN PEA.

Mrs. C. has been said within a year about a new lustrous plant, said to come from seed brought from Japan.

Mr. Teschemacher gave a description of the plant, which he calls *Cajanus bicolor*, a native of East Indies, Amboyna, Japan, &c.; flower small, interior yellow, vexillum purple, erect shrub, pubescent, nearest in alliance to *Lupinus*. The seeds are good to eat, and when young, very delicate. On soaking the round seeds for an hour in moderately hot water, they take exactly the form and appearance of the common white bean, become quite tender, and have a pure and delicious nutty and oily flavor. *The whole plant, with the seed, is excellent for fattening hogs and cattle.*

Mr. Ernst, of Cincinnati, has done considerable to get this new plant before the American farmers, considering it a valuable one for this country. The seed is as good as the common white bean for food, and better adapted for rich soils and warm climate, and the straw is excellent fodder for stock; and it promises to yield bountifully of both. In planting the peas, be careful to give them plenty of room to spread, as the stalks grow from three to four feet high, with an erect, bushy stem, having numerous branches, which are set with short, woolly pods. It seems to delight in a rich, loamy, moderately dry soil, and a rather warm climate; but it does not need a very long season. It certainly is a most wonderful prolific bearer, and no doubt will prove a valuable addition to our farm crops. So says the *N. Y. Tribune*.

VEGETABLE MONSTERS.—Oregon seems to rival even California in the productiveness of its soil, and the mammoth size to which vegetables attain. Mention is made by the papers of a huge cauliflower, raised opposite Portland, weighing forty-five pounds, and the world is challenged to beat it. Mr. Justin Chenoweth writes from the Dalles that he is growing in his garden a cabbage which he has carefully measured, and found it to cover a space embraced in a circumference of nearly fourteen feet, being four feet and six inches in diameter. The solid head is twelve inches in diameter. He thinks that the whole would weigh over fifty pounds. The seed which produced this plant was not sown until the 21st of May, and the head will probably attain sixteen inches in diameter. In the same garden he has grown turnips, many of which weigh ten pounds; and water-melons and tomatoes rivaling, both in size and flavor, the best that he had seen in the Mississippi Valley—all being of the first crop without plowing or spading, the planting and tending having been done exclusively with a light Yankee weeding hoe and a garden rake.

Of the 340 members of the Massachusetts Legislature, 109 are farmers, 46 lawyers, 46 merchants, 23 manufacturers, 9 physicians, 6 clergymen, &c.

FARMERS' GIRLS.

Up in the early morning, just at the peep of day,
Straining the milk in the dairy, turning the cows away.
Sweeping the floor in the kitchen, making the beds up stairs,
Washing the breakfast dishes, dusting the parlor chairs;
Brushing the crumbs from the pantry, hunting for eggs at the barn,
Cleaning the turnips for dinner, spinning the stocking-yarn,
Spreading the whitening linen down on bushes below,
Ransacking every meadow, where the red strawberries grow;
Starching the "fixens" for Sunday, churning the snowy cream,
Rinsing the pails and strainer down in the running stream,
Feeding the geese and turkeys, making the pumpkin pies,
Jogging the little one's cradle, driving away the flies;
Grace in every motion, music in every tone,
Beauty of form and feature thousands might covet to own,
Cheeks that rival spring roses, teeth the whitest of pearls,—
One of these country maids is worth a score of your city girls.

H. M. LADD.

North Hero, Vt.

New-York Tribune.

The following three recipes are valuable:

FRESH MEAT GRIDDLES.—Chop all the bits of cold fresh beef or veal, season with salt and pepper; make a griddle batter, and lay on a spoonful on the iron well buttered, to prevent its sticking, then a spoonful of the chopped meat, then a spoonful of batter over the meat, and when cooked on one side then turn, and when done carry them on hot, and they are very nice.

EXCELLENT APPLE FRITTERS.—Pare your apples and cut in thin slices, and mix them with your flour. Stir in a quart of milk and four eggs, a little salt and saleratus, to make a thick batter. Fry in plenty of lard.

FRUIT CAKE.—Take one pint of light dough; one tea-cupful of sugar; one of butter; three eggs, a teaspoonful of saleratus, one pound of raisins; nutmeg or cinnamon, to the taste, bake one hour. Let it stand and rise a little before baked.

BUCKEYE BREAD.—Take a pint of new milk warm from the cow; add a tea-spoonful of salt and stir in fine Indian meal until it becomes a thick batter, a gill of fresh yeast, and put it in a warm place to rise. When it is very light, stir into the batter three beaten eggs, adding wheat flour until it has become of the consistency of dough; knead it thoroughly, and set it by the fire until it begins to rise; then make it up into small loaves or cakes, cover them with a thick napkin, and let them stand until they rise again, then bake in a quick oven. So says the *Lynchburg Luminary*.

THE FARMER'S BANK.—Vault—Mother Earth. Exchanges—the transplanting of the nursery and garden.

Deposits—Happiness, sobriety and manly independence.

Assets—Shining fields, waving harvests.

Liabilities—Indebted to God alone, who sends the funds, the sunshine and the rain.—*National Free Press*.

She neglects her heart who studies the glass.

Miscellaneous.

For the American Agriculturist.

ANOTHER CHAPTER ON SCHOOLS.

I now wish to address a few words to children and youth, whose age entitle them to the privilege of attending schools in those States, where funds are provided for that important subject. Perhaps there may be some who never think or reflect upon the happy condition in which your lot is cast; a land (our constitution says,) in which all men are born free and equal; and it depends entirely on yourselves what rank you will take in society or in the government of the State in which you live, or in that of the United States. I was once asked by an English gentleman at a public dinner-table in the city of New-York, who had made a tour through Lower and Upper Canada, and thence through the towns, villages, and cities bordering on the lakes and rivers on the American side, what was the cause of the apparent want of enterprise; the low price of land and produce on one side, and the high price and progress of every thing on the other side? I said to him, "Sir, you have doubtless seen, as you have passed through the States, school-houses, at distances from one to three miles apart, built some of logs, some frames and weather-boarded, others of stone or brick, and as you enter the villages or cities, you must have observed large, handsome three story buildings; and if you happened to pass one of these at the hour of recess, you have seen these buildings surrounded by children all apparently cheerful and happy." "Yes," replied he, "I have noticed all this." "Well sir," I continued, "more or less of all these boys expect to be President of the United States, and some of the little girls expect that they will preside at the levee at the White House. Now how many of the children in Canada expect to be Queen of Great Britain?" "I understand the application," said he, "it is your institutions which make the difference; and I now view a republican government in a light I never did before."

But my dear young friends, privileges unimproved will benefit you very little. You may have the best of masters to teach, yet they can never *learn you*; this you must do for yourself. Some of you have not your whole time, even during the months allotted for you to attend school; but although your hands may be employed morning and evening in work which is indispensibly necessary, your minds may be working out a mathematical problem, or parsing a difficult sentence in rhyme, blank verse, or prose, and this very work which you are compelled to perform, tends to invigorate the mind as well as the body; and by forming systematical habits, you may far outstrip the sons of gentlemen who have their whole time for study, and who often become surfeited with their books; and when you appear side by side in your class, you will often be found excelling them in your clear conception of your lessons. These want to be digested as well as committed to memory. A partial knowledge, will do but little good to the intellect of the individual, who adds nothing further to it. Reading wants to have the meaning of every word understood; hence the importance of having a dictionary by your side

when learning your lessons, in order to get the full sense of every word.

But I am not going to usurp the place of a teacher, my object is to instil within your breasts a love for sciences, in order to make you useful in this world and happy in the next. Not that learning is absolutely necessary to our becoming Christians, but an intelligent Christian has much and many advantages over an illiterate one. The Bible does not teach the sciences, but it teaches our duty, and the more our intellect is cultivated, the better we understand our duty, and the more closely we live up to it, the more happy we are. If you want to know what your duty is, you may find it clearly revealed in the 20th chapter of Exodus, and it is this portion of scripture which you are required to obey, and which if you do obey, you will also obey your parents; and if you obey your parents at home, you will obey your teachers at school. Without implicit obedience, very little progress can be made in your studies, and opportunities unimproved can never be recalled, and consequently a degraded station in society will be your lot..

ALMOST AN OCTOGENARIAN.

DON'T BE EXTRAVAGANT.—If the poor-house has any terrors for you, never buy what you don't need. Before you spend three cents for a jewsharp, my boy, ascertain whether you can't make just as pleasant a noise by whistling, for which nature furnished the machinery. And, before you pay seven dollars for a figured vest, young man, find out whether your lady-love wouldn't be just as glad to see you in a plain one that costs half the money! If she wouldn't let her crack her own walnuts! and buy her own clothes. When you see a man paying five dollars for a Frenchified toy, that a philosophic baby will pull all to bits in five minutes, the chances are five to one that he will live long enough to realize how many cents are in a dollar; and if he don't, he's pretty sure to bequeath that privilege to his widow. When a man asks you to buy that for which you have no use—no matter how cheap it is—don't say yes! until you are sure some one else wants it in advance. Money burns in some folk's pockets, and makes such a pesky hole, that every thing that is put in, drops through, past finding.—*Lima Visitor.*

MARRIAGE.—Marriage is the nursery of heaven. The virgin sends prayer to God; but she carries but one soul to him; but the state of marriage fills up the numbers of the elect, and hath in it the labor of love, and the delicacies of friendship, the blessings of society, and union of hearts and hands. It hath in it more safety than single life; it hath more care, it is more merry and more sad; is fuller of sorrow and fuller of joys; it lies under more burdens, but is supported by all the strengths of love and charity, which make those burdens delightful. Marriage is the mother of the world, and preserves its kingdoms, fills its cities and churches, and heaven itself, and is that state of good things which God hath designed as the present constitution of the world.—*Bishop Taylor.*

WHAT'S IN A NAME?—If any one entertains the remotest doubt of this free and happy land being a great country, let him for ever keep silence after perusing the subjoined names of "fellow-citizens," who voted at the recent election in Nebraska for a delegate to Congress. They are copied from the poll-book:—"Jane-etah-equal-growl, Os-si-e-men-e-men-he, Mah-men-wan-e-kah, Pe-shah-hah-me-quah, Muh-at-tah-noh-noh-no-to, Kah-ku-noh-ne-we-to-to."—*Exchange paper.*

NEWSPAPER.—Hoyden's Dictionary of Dates says: In former times, (between the years 1595 and 1730) it was a prevalent practice to put over the periodical publications of the day, the initial letters of the cardinal points of the compass, thus—

N
E x W
S

N-E-W-S—importing that these papers contained intelligence from the four quarters of the globe. From this practice is derived the term *Newspaper*.

PAT AHEAD.—A Yankee and Irishman riding together, passed by a gallows:

"Pat," said the Yankee, "give that gallows its due, and where would you be?"

"Faith, that's easily known, I'd be riding to town all by myself all alone, sure," replied Pat.

Yankee owned up to being beat.

A SENSIBLE BOY.—A miserly old lady kept an inn. One day a famished soldier called on her for something to eat. Some bones, that had been pretty well picked, were placed before him. After finishing his dinner, a little son of the landlady noticing that the soldier found it very difficult to make out much of a dinner, put some money in his hand as he stepped out of the door. When his mother came in he asked her how much it was worth to pick those old bones.

"A shilling, my dear," said the old lady, expecting to receive the money.

"I thought so," replied the boy, "and I gave the old soldier a shilling for doing it!"

A PUN.—A gentleman named Dunlop being present, at a party where one of the company had made several puns on the names of persons present remarked that he had never heard his name punned upon, and did not believe it could be done. "There is nothing in the world more easy, sir," replied the punster; "just *lop off half the name, and it is Dun.*"

ANOTHER.—A Philadelphia judge and punster, having observed to another judge on the bench, that one of the witnesses had a *vegetable* head. "How so?" was the inquiry. "He has *carrotty* hair, *reddish* cheeks, *turnip* nose, *sage* look."

DEATH IN CHILDHOOD.—To me, few things appear so beautiful as a very young child in its shroud. The little innocent face looks so sublimely simple and confiding amongst the cold terrors of death. Crimeless and fearless, that little mortal has passed alone under the shadow and explored the mystery of dissolution.—*Dublin Magazine.*

THEMISTOCLES being asked how he would marry his daughter—whether to one that was poor but honest, or to one that was rich but of ill reputation—made answer: "I would rather have a man without an estate, than have an estate without a man."

CLERGYMEN.—John Adams being called upon for a contribution for foreign missions, remarked: "I have nothing to give for that cause; but there are here in this vicinity, six ministers, not one of whom will preach in the other's pulpit; now I will give as much and more than any one else to *civilize these clergymen?*"

HATH any wronged thee? be bravely revenged; slight it, and the work is begun; forgive it, and 'tis finished. He is below himself, that is not above an injury. Was it not Plato who said, that when an injurious speech was offered to him, he placed himself so high that it could not reach him?

CREEPING THINGS—THE SPIDER.

LET me put a spider into any lady's hand. She is aghast. She shrieks. The nasty ugly thing! Madam, the spider is, perhaps, shocked at your Brussels laces; and although you may be the most exquisite miniature painter living, the spider has a right to laugh at your coarse daubs as she runs over them. Just show her your crochet work when you shriek at her. "Have you spent half your days," the spider, if he be spiteful, may remark—"have you spent half your days upon the clumsy anti-macassars and these ottoman covers? My dear lady, is that your web? If I were big enough, I might with reason drop you and cry out at you. Let me spend a day with you and bring my work. I have four little bags of thread—such little bags! In every bag there are more than a thousand holes—such tiny, tiny holes! Out of each hole thread runs, and all the threads—more than four thousand threads—I spin together as they run, and when they are all spun, they make but one thread of the web I weave. I have a member of my family who is herself no bigger than a grain of sand. Imagine what a slender web she makes, and of that, too, each thread is made of four or five thousand threads that have passed out of her four bags through four or five thousand little holes. Would you drop her too, crying out about your delicacy? A pretty thing indeed for you to plume yourself on your delicacy, and scream at us." Having made such a speech, we may suppose that the indignant creature fastens a rope round one of the rough points of the lady's hand, and lets herself down lightly to the floor. Coming down stairs is noisy, clumsy work, compared with such a way of locomotion. The creeping things we scorn are miracles of beauty. They are more delicate than any ormolu clock or any lady's watch made for pleasure's sake no bigger than a shilling. Lyonnnet counted four thousand and forty-one muscles in a single caterpillar and these are a small part only of its works. Hooke found fourteen thousand mirrors in the eye of a bluebottle, and there are thirteen thousand three hundred separate bits, that go to provide for nothing but the act of breathing, in a carp.—*Dickens' Household Words.*

BARBARIETY OF EXPOSING CHILDREN'S LIMBS.

I CANNOT pass without a word the barbarous regimen which custom and the ignorant convictions of many parents, have prescribed for infants and young children. I allude to the practice of half-dressing children, which is adopted in almost all weathers—sometimes with a view to show off; sometimes, as is said, to invigorate and harden the child. The continued impression of cold thus allowed to be made on the arms, shoulders, legs, and often the bodies of young children, must result, unless the power of the system be very great, in gradually establishing a congestive circulation that will favour the development of tubercles in the lungs, or mesenteric glands, of dropsy of the brain, of chronic diarrhoea, bronchitis, catarrh, and so on; to say nothing of the multitudes of the little sufferers cut off by croup and other acute inflammations. Parents should know, and not forget, that children have less power of generating heat than adults; and that, consequently, in cool or cold weather their bodies and limbs should receive as careful an envelopment and protection as those of grown persons liable to the same degree of exposure; for a more careful and selfish attention of the latter to their own comfort and health will hardly admit of.

ONE THOUSAND HORSES AND A WIFE FOR AN AGRICULTURIST.—The Hæcuse chief offers one thousand horses to any respectable white young man, well recommended, who will marry his daughter—a girl of about eighteen—settle down among them, and teach them agriculture. The horses are worth from fifty to eighty thousand

dollars. "I have seen this valuable squaw," says the editor of the *Prairie Journal*. "She is about the medium size, with tolerably regular features, high cheek-bones, sloping forehead, black-eyed and dark hair. Her form is square and stout. Her long hair fell over her shoulders profusely ornamented with beads and shells. Her step is light and proud, her gait easy and graceful."

BOSTON AND NEW-ENGLAND.—From recent statistics published, it appears that Boston has a valuation at the present time of nearly three times that of the State of Maine, and about as much as the States of Vermont, New-Hampshire, and Rhode Island combined. The expenses of the city government of Boston exceed those of the six State governments of New-England! The banking capital of Boston, with the recent and contemplated additions, will be only one-fourth less than that of New-York city, twice that of Philadelphia and Baltimore combined, and probably more than the aggregate capital of Maine, New-Hampshire, Vermont, and Rhode Island.—*Boston Traveller.*

SIZE OF THE WEST.—Illinois would make forty such States as Rhode Island, and Minnesota sixty. Missouri is larger than all New-England. Ohio exceeds either Ireland, or Scotland, or Portugal, and equals Belgium, Scotland, and Switzerland together. Missouri is more than half as large as Italy, and larger than Denmark, Holland, Belgium and Switzerland. Missouri and Illinois are larger than England, Scotland, Ireland and Wales.

THE Rochester American says that the day before Prof. Agassiz's departure, he bought a "string of fish" of a boy in the street, which contained ten specimens of a species never described by any naturalist. The fish were caught in Irondequoit Bay, and come under the general designation of "sun-fish" among anglers.

A CHAP walking with a lady, stumbled, and accidentally fell. The lady, thinking to commiserate his mishap, observed that she regretted his "unlucky faux pas." "I didn't hurt my fore paws," replied he, "it was my knee."

"Can't touch me, or I'll scream!" as the engine-whistle said to the stoker.

MRS. PARTINGTON says that she has noticed that whether flour was dear or cheap, she had invariably to pay the same amount of money for fifty cents' worth.

SPECIAL NOTICE TO ALL SUBSCRIBERS.

We find that by using such good paper, our volume of 832 pages will be quite large to bind, and especially large for those who wish to stitch their paper together with an index, without being at the expense of binding. To obviate this, we have concluded to be at the expense and trouble of making out an extra index with No. 26, so as to form a complete volume of the first 26 numbers. The index for the next 26 numbers will be given at the end of the year, or with No. 52. This arrangement will make it convenient for all, as the 52 numbers can be stitched or bound in two volumes with an index for each, or in one volume with the double index at the close.

We hope all will preserve their numbers, for there are many single articles each of which will be worth the price of the volume, for future reference. When the paper arrives from the post-office, a good plan is to see that it is properly folded, and then pin or sew it through the middle and cut open the leaves. It is very easy to stitch 26 numbers together. To do this, arrange them in regular order, and with an awl punch several holes about one-fourth of an inch from the back, and through these run a strong thread two or three times with a darning-needle, and

the work is done. We have scores of volumes of papers, pamphlets, and addresses, thus prepared, which serve all the purposes of a bound volume, and occupy less room in storing and carrying. We would, however, prefer to see volumes of agricultural papers neatly bound and laid upon the book-shelves or tables of farmers. They are much better and more appropriate ornaments, than gilded volumes of trashy magazines or novels.

ONE WORD MORE.—We thank our friends for the liberal aid they have afforded us in extending the circulation of the *Agriculturist*. Our list has increased beyond our expectation, and we are daily encouraged to labor with the utmost diligence, to make our paper worthy of the confidence and admiration of our largely increasing list of readers. Our reliance for the continuance and increase of our list is upon those who are already readers. As stated above, we now divide the year so as to give either one or two complete volumes of the 52 numbers. This number begins the second volume or half of the year. We respectfully request all our present subscribers to make a little exertion at this time, and each send us on at least one new name. If you cannot get your neighbors to send on for a year, ask them to try the paper for six months, as in that time they will get a complete volume of 416 pages with index for \$1, or less if clubs are formed. Where clubs already exist new names may be added at the same rate, and these names may be at different post-offices. See the last page for terms, special notices to subscribers, &c.

TO CORRESPONDENTS.—We have several communications on hand which we will look over as soon as we have time, and some of them will be published. It is no trifling labor to prepare for the printer many communications which we receive. Some are written so closely that there is not room to put in corrections, without re-writing the whole. We cheerfully prepare articles, unless there is manifest want of care on the part of the writer. If he does as well as he can, we make all needful changes and corrections.

As most writers doubtless wish to improve their own style, we suggest to them to keep an exact copy of their communications, and then compare this copy with the printed sheet. They may often learn something in this way.

We are not anxious to receive original poetry. We have little space for rhyme, and we have good selections enough to last us a year at least. Good poetry, however, will not be rejected; but we advise all who attempt to write in verse to remember, that good rhyme does not constitute good poetry; on the contrary, some of the best poetry we have ever seen does not "rhyme" at all, while some of the best rhyme contains not a single poetic sentiment.

Markets.

REMARKS.—There has been quite a panic in Flour the past week, and a much greater fall in the price than any week for a long time past. The fall has been at least 62½ to 75 cts. per bbl.; and if the articles were pressed hard upon purchasers, it would be still lower. Some think there will be a reaction soon; but with the large arrivals that are now expected on the opening of Lake, River, and Canal navigation, nothing save a great advance in Europe will ever keep Flour up to its present price. Wheat has given way 10 to 12 cts. per bushel. Corn is 3 to 5 cts. per bushel less. Rye and Barley have fallen but little, while Oats remain nearly the same. Provisions about the same. Clover not so high by one cent per lb. Wool, nothing worth noting.

Cotton, an advance of $\frac{1}{4}$ of a cent per lb., Rice a slight decline, Sugar heavy, without change in price, Tobacco the same.

Money is greatly in demand, and outsiders get little accommodation for less than 10 to 15 per cent. Stock of course falls as money rises.

The weather on the 18th, 19th, and 20th very cold for the season. It is now milder, and we hope we have seen the last of winter. Plowing and planting the earliest crops are going on here notwithstanding Jack Frost.

From the Mark Lane Express, Feb. 27th.

REVIEW OF THE BRITISH CORN TRADE.

THE Wheat trade has assumed a firmer tone since our last, and rather extensive transactions have taken place at several of the leading provincial markets. The demand has been of a strictly consumptive character; but the millers having for some weeks past refrained from buying, have been compelled to purchase in order to replenish their stocks. A rise, established under such circumstances, may generally be regarded as sound; and we should not be surprised to witness a further improvement in prices; in fact, we deem it probable that the decline which has taken place since January may be recovered. The demand has thus far been freely met by holders, and there seems to be no disposition on the part of either importers or farmers to run up prices by withholding supplies.

From the Mediterranean and Black Sea ports a considerable number of cargoes have reached our coast; most of these had, however, been sold before they came to hand, and having been dispersed to different ports, have not caused much pressure. Advices from Marseilles intimate that further shipments from thence for Great Britain were in progress; but the late decline here, and a small rally which had taken place there, may tend to check supplies.

The Baltic ports are not as yet free from ice; but in some cases vessels have been laden at considerable expense across the ice, and the latter has subsequently been cut away so as to permit the ships to put to sea; we may, therefore, calculate on receiving a moderate quantity of Red Wheat from the Lower Ports some time before the period it could have reached us in the ordinary course. The Baltic shippers are evidently very anxious to get their Corn safely on this side, under the apprehension that difficulties may hereafter arise to shipments being made; considering, however, that a strong fleet is to be dispatched very shortly to the Baltic by England and France, there is not much danger of supplies from thence being interrupted.

Thus far, we have had our wants liberally provided for, and as yet there are no symptoms of that want being experienced which some apprehended might be felt. We have all along maintained that it was merely a question of price, and that so long as Great Britain could afford to pay higher rates than other countries, we should not lack supplies from some quarter or other. The only time when there appeared danger of such an occurrence was when France was out-bidding us in America, in the Black Sea, and Baltic; but when once prices here rose sufficiently high to draw what those countries had to spare to England, supplies soon increased. Latterly, we have been receiving rather large quantities of breadstuffs from France; but this will not last, her wants are too well-ascertained to allow us to expect that she will long be able to export; indeed, it is more than probable that we may ere many months have French buyers in our markets.

Before long the weather will begin to have its influence; thus far, the young Wheat plant is well spoken of, which circumstance, and the knowledge that a larger breadth of land is under this crop than usual, have tended to keep matters quiet; and should we continue to have a

favorable season, it would assist materially in checking speculation, but the occurrence of any thing likely to detract from the productiveness of the next harvest would be likely to cause great excitement. During the next few weeks we calculate on a good consumptive demand for Wheat, with some advance in prices; we think, however, that the stocks on hand and the supplies which may reach us will suffice to prevent any great rise.

PRODUCE MARKETS.

Wholesale prices of the more important Vegetables, Fruits, &c.

Washington Market, New-York, March 18, 1854.

VEGETABLES.—Potatoes, Western Reds, $\frac{3}{4}$ bbl., \$2 37 $\frac{1}{2}$; Merinos, \$2@2 12 $\frac{1}{2}$; Mercers, \$3@3 25; Carters, very scarce, and worth \$3 50; Onions red, $\frac{3}{4}$ bbl., \$1 75; white, \$2 50; yellow, \$2; Turnips, $\frac{3}{4}$ bbl., \$1 50 for yellow; white, \$1; Cabbage, $\frac{3}{4}$ hundred, \$5@5 10; Spinach $\frac{3}{4}$ bbl., \$2 50; Parsneps $\frac{3}{4}$ bushel, 62 $\frac{1}{2}$ c.; Carrots, $\frac{3}{4}$ bushel, 62 $\frac{1}{2}$ c.; Celery, $\frac{3}{4}$ doz. bunches, \$1 25@\$1 50; Beets, $\frac{3}{4}$ bushel, 62 $\frac{1}{2}$ c.

FRUITS.—Apples, Spitzenburgs, $\frac{3}{4}$ bbl., \$3 50; Greenings, $\frac{3}{4}$ bbl., \$3 50; Roxbury Russets, $\frac{3}{4}$ bbl., \$3 50; all of these are assorted lots; Cranberries, $\frac{3}{4}$ bbl., \$9; extra price, \$10; Maple Sugar, per lb, 12 $\frac{1}{2}$ c.

The markets are not as brisk as usual. The rivers having opened, buyers are holding back for the purpose of obtaining produce at a lower rate, which they probably can do in the course of a week. The fruits in market at present are of the best quality; the season for some of them will soon be over.

NEW-YORK CATTLE MARKET.

Monday, March 20, 1854.

WE notice some falling off in the market to-day, the number present being considerable less than for some weeks past; and with one or two exceptions the cattle are not of as good quality as usual. There were eight Devon cattle in market to-day, fed by Mr. Wm. A. CLARK, of Woodbridge, Ct., the finest lot in the hands of one feeder we have noticed this season. For beauty of color and shape they are seldom equaled. The average weight was 2043 lbs. Four of these were sold for 11 cents, and this price was asked for the others which were not sold at the time of making up this report. The Devon cattle generally bring the highest prices as they look better, and show their flesh better than most other breeds, and consequently suit the taste of buyers generally. Another lot of 85 head owned by Mr. SELDON-ridge, Lancaster Co., Pa., native breeds, looked very well. These two lots were the only exceptions to the above remark as to quality.

The prices ranged about the same as last week, viz, lowest price, 8c., and highest, 10c., with the exception of the extras.

Washington Yards, Forty-fourth street.

A. M. ALLERTON, Proprietor.

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY
Beeves, 1,625	1,600
Cows, 20	
Sheep, 435	
Swine, 1482	
Veals, 498	

Of these there were forwarded by the Harlem Railroad, beeves, 25; cows, 20; sheep, 435.

By the Hudson River railroad, beeves, 250; swine, 98.

By the Erie railroad, beeves, 600; swine, 1354.

ADVERTISEMENTS.

Advertisements for the American Agriculturist must be paid for in advance.

ISABELLA GRAPE VINES.

OF PROPER AGE FOR FORMING VINEYARDS, CULTIVATED from, and containing all the good qualities which the most improved cultivation for over fourteen years has conferred on the Croton Point Vineyards, are offered to the public. Those who may purchase will receive such instructions for four years, as will enable them to cultivate the grape with entire success, provided their locality is not too far north. All communications addressed to R. T. UNDERHILL, M. D., New-York, or Croton Point, Westchester Co., N. Y., will receive attention. The additional experience of two past seasons, give him full assurance that by improved cultivation, pruning, &c., a crop of good fruit can be obtained every year, in most of the northern, and all the middle, western, and southern States.

N. B. To those who take sufficient to plant four acres, as he directs, he will, when they commence bearing, furnish the owner with one of his vine-dressers whom he has instructed in his own mode of cultivation; and he will do all the labor of the vineyard, and insure the most perfect success. The only charge a reasonable compensation for the labor.

23-31. R. T. U.

GENUINE SUPER-PHOSPHATE OF LIME.

THE SUBSCRIBER HAS NOW ON HAND, AND IS CONSTANTLY MANUFACTURING at his works in MIDDLETOWN, CONN., SUPER-PHOSPHATE OF LIME, which he warrants free from any adulteration, and equal, if not superior to any in the market. It is made of bones, prepared in the most approved manner, put up in substantial bags for transportation, and is furnished promptly to order, or at the works.

He also manufactures and has constantly on hand for the market, BOXES OF a superior quality.

These fertilizers have been thoroughly tested by careful and experienced agriculturists in this vicinity, and have given general satisfaction.

MARCH 13, 1854. [23-40.] MIDDLETOWN, CT., ANDREW COE.

OPERATED RABBITS OF IMPORTED STOCK (Price \$10 per pair.) for sale by S. PARSONS, Flushing, L. I.

28-31

NEW 'POUDRETT'S' MANUFACTORY.

AN EXCELLENT OPPORTUNITY FOR ENTERPRISING

men, particularly farmers, to invest funds in a business

brarling large interest.

GEO. BOMMER'S proposals for the formation of a JOINT

STOCK COMPANY, for the purpose of erecting an ESTABLISHMENT

near the city of New-York, having for its object: 1. THE

DRAINING OF SWMS, either by means of air-tight night-carts

or, by atmospheric pressure; 2. THE CONVERSION OF SAID SWM

MATERIAL INTO MANURE, to be called "IMPROVED POUDRETT'S"; 3.

THE PREPARATION OF "AMMONIATED SUPER-PHOSPHATE OF LIME;" a

concentrated rich manure, being in its effects equal to guano,

to be made chiefly of bones, acids and ammonia.

MR. BOMMER, with a view of promoting the farming inter-

est and desiring to have the greater part of the shares of

the capital stocks subscribed by farmers themselves, offers to

any farmer or gardener who subscribes for shares, to have

manure for his own use at 25 per cent. lower than the com-

pany's market price.

Further information on the subject will be found in a pam-

phlet, containing the basis, terms and conditions on which

said establishment is to be founded, together with a state-

ment of expenses for fixtures; its working costs; and its in-

come. Said pamphlets can be had at the office of MR. BOM-

MER, 74 Greenwich st., New-York city, at which place ap-

plications for shares, or descriptive pamphlets can be made

personally or by mail.

25-11. GEO. BOMMER.

DIRECTIONS FOR THE USE OF GUANO.—A full and

minute description of the different crops and soils to

which Peruvian Guano is adapted, with full directions for its

application, a pamphlet for 96 pages, and can be sent through

the mail. Price 25 cents.

—11. R. L. ALLEN, 187 and 191 Water st.

3000 QUINCE TREES FOR SALE.

APPLE AND ORANGE QUINCE TREES OF LAST YEAR'S

Cuttings, and two, three or four years old. For sale by

JAS. J. SCOFIELD. Inquire of THOMAS BURKE.

MARCH 17, 1854. [23-31.] MORRISTOWN, N. J.

MUSQUIT GRASS.

THE TRUE MUSQUIT GRASS, GROWN BY A CAREFUL

Georgia Planter. This has proved the most sure and

valuable grass for stock yet cultivated at the South, and is

invaluable to the planter. For sale by

RICHARD PETERS, Atlanta, Ga.,

also by R. L. ALLEN,

27-11 187 and 191 Water St., N. Y.

SUPERIOR FRUIT AND ORNAMENTAL TREES.—CHEAP.

WM. R. PRINCE & Co., Flushing, Long Island, in con-

sequence of the Railroad passing through their largest Nur-

series, will sell about 50,000 trees at very reduced prices—com-

prising Fruit Trees in a bearing state, and Ornamental Trees

of the largest size, including the finest evergreens and all

other articles. Catalogues may be had at 113 Chamber st.,

and will be mailed to applicants.

CLARK, AUSTIN & SMITH,

No. 3 PARK ROW, and No. 3 ANN STREET, HAVE RE-

cently published new editions of the following books:

NORTON'S SCIENTIFIC AGRICULTURE.

Elements of Scientific Agriculture, or the Connection between

Science and the Art of Practical Farming. Prize Essay of the

New-York State Agricultural Society. By John P. Norton,

M. A.

CATECHISM OF AGRICULTURAL CHEMISTRY AND

GEOLOGY.

By James F. W. Johnston. With an Introduction by John P.

Norton. 25-29-31-33

CHARTER OAK GRAPES.

NOTICE.—THE UNDERSIGNED WISHES TO DIRECT

particular attention to these magnificent grapes, which

he has propagated with such success, that they are beyond

comparison the largest grapes known. He has many one

and a half inches in diameter. The grape is perfectly hardy,

and will endure the winter, and ripen 2 or 3 weeks sooner

than the Isabella or Catawba. The Charter Oak Grape is

unsurpassed for preserving and for wine—and a delicious

table fruit. Orders up to 1st May received by subscriber, at

5 Scammel street, New-York city. After that date at Frank-

fort, N. Y. [27] JOHN P. WILSON.

MORRIS FEMALE INSTITUTE.

THIS INSTITUTION IS SITUATED AT MORRISTOWN.

N. J., about an hour and a half's ride from the city of

New-York, on the Morris and Essex railroad; the cars leav-

ing New-York several times a day. It has been ably patron-

ized for the last six years. There will be a vacancy for a few

more pupils in April.

Faithful teachers are provided for English branches usually

required; also Drawing and Painting, French, Latin, and

Spanish under a native teacher.

Vocal and instrumental music by an accomplished player,

whose time and attention has been for years devoted exclu-

sively to this object.

Further particulars, and circulars, may be obtained by ap-

plying to J. A. SEELEY, Principal, or at the book-store of

Messrs. C. Shepard & Co., 152 Fulton street, near Broadway,

or at this office.

Persons wishing to send their daughters from home, would

do well to visit this Institution before deciding.

27-11

FRESH GARDEN SEEDS OF ALL THE BEST VARI-

eties. Also a choice collection of GREEN-HOUSE AND

GARDEN PLANTS, FLOWER ROOTS, &c. For sale at A. BRIDGE-

MANS'S HORTICULTURAL ESTABLISHMENT, Nos.

574 & 575 Broadway, above 18th street, New-York.

27-31 Garden & Greenhouses, Astoria, L. I. 26-38

EARLY EXCELSTOR POTATOES.—THIS IS A NEW AND

very superior sort. They are as early as the June pota-

toes, grow above the average size, are mealy and palatable,

and have kept better than any other variety planted in this

vicinity. The rot has never been known among them.

Maiden Lane.) Manufacturer of Blank Books, and Im-

porter and Dealer in Paper and Stationery of every descrip-

NO. 1 SUPERPHOSPHATE OF LIME.—THIS VALUABLE fertilizer has been used for several years in England and other parts of Europe, and, next to Guano, holds the highest rank in popularity, and the extent to which it is used among farmers. Its introduction in this country has been more recent; but the progress it has made in the estimation of the public has not been less marked or successful than abroad. It is now extensively used throughout the Northern States, after a full trial and investigation of its merits; and it is rapidly becoming, like its predecessor, Guano, a favorite manure at the South and West.

It is composed of crushed or ground bones, decomposed by the addition of about one fifth the weight of sulphuric acid, diluted with water, to which is added a due proportion of guano and sulphate of ammonia. The latter is the active and one of the most efficient agents in the best Peruvian Guano.

It is suited to any soil in which there is not already a full supply of the phosphates, which is seldom the case. All crops are benefited by its application.

For sale in large or small quantities, in bags of 150 lbs. each. No charge for packages. All bags will be branded "C. B. De Burg, No. 1 Superphosphate of Lime."

PERUVIAN GUANO of best quality.

AGRICULTURAL AND HORTICULTURAL IMPLEMENTS of all kinds.

FIELD AND GARDEN SEEDS, of various sorts, fresh home grown and imported.

THE AMERICAN AGRICULTURIST—weekly, \$1 per volume—two volumes a year.

For sale at **R. L. ALLEN'S** Agricultural Warehouse and seed Store, 189 and 191 Water street, New-York. 25-tf

FOR SALE AT THE SOUTH NORWALK NURSERY, THE Great New Rochelle or Lawton Blackberry Plants; also plants of the White fruited Blackberry. For sale also a large stock of small plants of the new or North River Red Antwerp plants, at the low price of fifteen dollars per thousand. The above plants all warranted.

GEO. SEYMOUR & CO., South Norwalk Nursery, Conn. 24-36

ATKINS' SELF-RAKING REAPER.—40 of these machines were used last harvest in grass or grain or both, with almost uniformly good success, in nine different States and Canada. **TWENTY-SIX PREMIUMS**, including two at the Crystal Palace, (silver and bronze medals) were awarded it at the autumn exhibitions. It is building only 800, which are being rapidly ordered. Mr. Joseph Hall, Rochester, N. Y., will also build a few. Early orders necessary to insure a reaper.

Price at Chicago \$175—\$75 Cash with order, note for \$50, payable when reaper works successfully, and another for \$50, payable 1st December next with interest. Or \$100 cash in advance. Warranted to be a good Self-Raking Reaper.

Agents properly recommended, wanted throughout the country. Experienced agents preferred. It is important this year to have the machines widely scattered.

Descriptive circulars with cuts, and giving impartially the difficulties as well as successes of the reaper, mailed to post-paid applications. **J. S. WRIGHT,** "Prairie Farmer" Warehouses, Chicago, Feb., 1854. 23-35

POUDRETTE.

THE LODI MANUFACTURING COMPANY OFFER their Poudrette for sale in lots to suit purchasers, from a single barrel up to 4000 barrels, at their usual rates, \$1 50 per barrel for any quantity over seven barrels, delivered on board of vessel in the city of N. York, free of cartage or other charge. When 200 or 300 barrels are taken, a deduction will be made from the above price. That this article has stood the test of four years trial is proof of its efficacy. It is the cheapest and best manure for corn ever produced, and it has the advantage of being useful in small quantities and harmless in large. It is a capital manure for peas, strawberries, &c., and all garden vegetables. Apply by letter or personally to the Lodi Manufacturing Company, 22-34 74 Cortlandt st., New-York.

GARDENER FOR THE GREEN-HOUSE AND GRAPE-HOUSE.—Wanted a Gardener as above, who is experienced in the management of the Green and Grape-House in the United States. None need apply except fully qualified. 22-tf **A. B. ALLEN,** 189 Water st.

SEEDS.

SEEDS.—TIMOTHY; RED AND WHITE CLOVER; BLUE Grass; Orchard Grass; Bay Grass; Red Top; Sugar Corn; Peas; Beans; Turnip; Cabbage; Beet; Lettuce; Onions; Radish; Squash; Osage Orange; Large Yellow Locust, and all other kinds of field and garden seeds. Also Kentucky Roots; Asparagus Plants, &c. and 191 Water street. 1-tf

STOCK.

IMPROVED STOCK OF ALL KINDS.—HAVING HAD great experience in breeding and rearing fine stock for the past twenty years, I offer my services to my friends to procure it of the best and most reliable kinds. As much notice as convenient is at all times desirable previous to purchasing, as it takes time to make good selections. Early in August or September is the best time to purchase for the South.

Short Horn or Durham cattle, Devons, Herefords, Alderney or Jersey and Ayrshires. Long-wooled Sheep—the Cotswold, Oxford, Leicester, Bakewell, and Lincoln. Mutton Sheep—the Southdown. Fine-wooled Sheep—such as the Saxon, Spainish, and French Merino.

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, which are spurious. 1-tf **A. B. ALLEN,** Nos. 189 and 191 Water street.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master, and ask him to mark the envelope, *Registered by —, P. M.*

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In writing, always give the Post-office (instead of the town) and the County and State. *Write these very plainly.*

Clubs may add to their number at the same rate per copy as was paid by the original members.

Those wishing their papers changed from one office to another, should give the name, county, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

J. A. GRAY, Printer, 95 and 97 Cliff street, N. Y.

PUBLISHERS' ANNOUNCEMENT!

Twelfth Volume of

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of the year for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The lumbbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon its own merits; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammeled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDD, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers,.....	\$2.00 a year, \$2.00
" Clubs of 3 do.....	1.67 " 5.00

MUTTON MARKETS OF THE UNITED STATES.

Why it is that in a country, so favorable to sheep as this, we have so little good mutton, is a standing wonder to every Englishman, and a burning shame to our American farmers. We have little doubt that there is more poor mutton sold in the markets of New-York alone, than in the whole of England; and for no reason whatever, but the niggardly meanness of our farmers in neglecting to buy good South-down, Cotswold, or Leicester rams to breed in with their old-fashioned and worthless ewes. We do not now speak of Merinos or Saxons as a mutton sheep. They are valuable for their wool alone; yet thousands of them are killed and sold in the markets, and help to make up, with the lean brutes called "common sheep," all over the country, the wretched stuff dignified by the name of mutton! Indeed, so worthless are millions of our farmers' sheep, that almost every year hundreds of thousands have been slaughtered in the large interior towns, for their pelts and tallow alone; the latter article, by the way, scarcely perceptible, but for the aid of the steam vat and hydraulic press applied to the whole carcass.

Now, let us ask, in all sincerity, what is the use of keeping such a miserable race of animals as the common sheep? The only answer that can be given is, either that those who breed them know no better; or, that being determined to starve them any way, they will, from long habit and neglect, bear starvation better than any other breed; and this mode of treatment can certainly lead to no profitable result. From the anatomy of the animal, they can lay on, under ever so favorable circumstances, but little flesh, and that flesh not in the best parts. They have, even when called fat, a large preponderance of bone; and in a lot of what butchers commonly call good ones, if the dressed carcass, come up to one-half the gross weight when alive, it is a good yield of flesh. In proportion to their weight, common sheep are large consumers, eating more than a well bred sheep of greater weight, and their merits, in comparison with better ones, may be thus classed: great eaters, bad feeders, the worst fence-jumpers, giving a light fleece of poor wool, late to mature, and yielding a light carcass of the most detestable mutton.

There can be no apology for breeding this kind of sheep, when good Long-wooled and South-down rams can be bought for twenty to fifty dollars a head. A good ram, well kept,

will serve fifty ewes in a season, and without accident, will last five years, and his fleece nearly or quite pay for keeping. These lambs, in the most remote markets, are worth fifty cents to a dollar more, at three to four months old, than common ones for the butcher, and will bring it, too, among any people who know the difference between good mutton and poor. If well kept on hay and grass only until two years old, they may be fed off in a good carcass of flesh; grass fed only, at sixty to eighty pounds dressed, besides giving ten to twelve pounds of rough tallow; or if stall fed until the succeeding February or March, they will give you a carcass of 80 to 120 pounds, and 15 to 20 pounds of tallow, depending somewhat upon the material and manner of their feeding. The pelt is worth more than that of a common sheep of the same age, which cannot then be fattened at all; and thus you have at an early market, an early and a good return for what, if of the other kind, you could not realize half the amount, besides saving one to two years in the keep of the animal, and the risk, and interest on the amount of capital invested.

The thrifless farmer need not excuse himself by saying that he cannot afford to buy sheep at this price. If he cannot afford to buy the material to produce a good article from his farm, he had better abandon farming at once, and go into some other occupation, if he can find it, which pays a premium on stupidity and ignorance. He need only get a good ram to start with. If his ewes be even of the commonest breed to be found, if he will keep them decently, and breed to his ram, they will improve two hundred per cent. in their first produce; and then *breeding up* from these, using a thorough-bred ram continually, he will, in the course of two or three crosses, have as good sheep for practical uses as if he had the thorough-bred altogether—*bearing in mind always*, never to use a grade ram when a thorough-bred one is to be had.

We have tried this experiment out and out. At different times we commenced two several flocks of sheep, chance having put in our way, each time, as contemptible a collection of ewes as could be picked up in a frontier country. They were intended for mutton, and bought contrary to orders, and being fit for nothing else, like thousands of others, with an article too worthless to make other use of, we put them to breeding—with this difference, however, we let them to thorough-bred Cotswold and South-down rams, instead of one of their own villainous race. From these, even in the first cross, and much more in the second, we bred wethers of the sizes and weights already recorded. It is an extraordinary stall-fed wether of the common breed that will give a carcass at three or

four years old, of 75 pounds; or grass-fed of 60 pounds. They will not average over 50 pounds, and oftener undergo than overrun that weight. We say, therefore, to all who grow mutton sheep—and none are so profitable within railroad reach of our large cities—procure well-bred South-downs, Leicester, or Cotswold rams, as your climate or soil may best be adapted to either, and go to *breeding them up*, on such material as you have, and you will find your account in it.

ITALIAN RYE GRASS—RAY GRASS.

As the letter below is similar to others frequently addressed us, and as we have not time to reply to them separately and privately, we trust the writer will excuse its publication in order to give us an opportunity of a general answer.

There are many varieties of the Italian Rye Grass, annual, biennial, and perennial; some of them have bearded heads like common rye, others are smooth or awnless (beardless.) The latter varieties are preferred.

In the cool, moist climate and mild winters of Great Britain, this grass succeeds well, and is much liked. We have often seen it growing there. The only person we are personally acquainted with who has grown it in the United States, and expressed his approbation of it to us, is Mr. Alsor, of Middletown, Connecticut. From all we can hear of it, however, it is little superior for early spring pasture to the common rye of America, or beardless wheat, as it grows coarse and gives little after math.

Ray grass is entirely distinct from *Rye grass*. The former is a perennial, comes forward early in the spring, grows rapidly till July, and yields an abundant aftermath. It requires a rich soil and deep tilth. North of 40 degrees of latitude, it should be sown in the spring, and like any other grass seed. It may occupy the ground entirely alone, or be sown with other grass seeds, or clover. If sown alone, it requires two bushels of seed per acre; but to get a first rate stand and thickly cover the ground, three bushels would be better. The cost in this city is \$3 per bushel for pure, well cleaned imported seed.

Ray Grass makes a superior lawn, but it must be cut often, otherwise it grows up too coarse. Frequently cut, it becomes fine, and makes a softer, thicker, and more velvety turf than any other grass we have yet seen cultivated in the United States.

For hay, neither Ray nor Rye grass is equal to Timothy or red top. They grow too coarse, and become too dry and woody. Still we have heard some assert that they make good hay. They probably cut them when younger and greener than ours was; but we repeat, we are yet to be

convinced that they will make as good hay as Timothy, under any circumstances.

Ray Grass has been successfully cultivated in this country for pasture, as far North as Connecticut, and as far South as North Carolina.

But the earliest grass in the spring and the latest in autumn, is the Orchard grass. It grows larger and yields more abundantly than any other of the cultivated grasses. It is also hardy, and we have seen it flourishing well almost to the 44th degree of North latitude. For hay it is inferior to Timothy, and about equal to Ray grass. We have seen it grow thickly over a large field, to the average height of four and a half feet—much of it was over five feet high. The yield was judged to be at least three and a half to four tons per acre. It rarely yields less than two tons per acre at the first cutting, and half as much more at the second. In this climate it is ready for cutting early in June, and in very favorable seasons we have known it to give three cuttings.

It requires a rich, dry soil, and deep tilth, and should be sown in the spring with no other grass seed with it, otherwise it comes up in uneven tufts, and soon runs out. Sow at least one and a half to two bushels of seed per acre, harrow it in well, and then roll the ground smooth. The present New-York price of choice seed, is \$2 50 per bushel. Inferior seed can be had for less. We shall be happy to assist our friends in obtaining and experimenting upon this grass, and will see that any orders entrusted to our care are supplied with the best seed to be obtained. Below is the letter alluded to.

Having read a great deal in the *Albany Cultivator* about the *Italian Rye Grass*, and the extraordinary growth which it attains in Europe, I write for the purpose of ascertaining whether it is for sale in New-York; or if not, whether it can be procured in this country. If you can procure it for me, be so kind as to let me have the earliest information. Please also to state the price per bushel, as I think there are several in this vicinity who will avail themselves of the opportunity of procuring it if it is to be had. I feel satisfied that it will with proper culture prove equally beneficial in this country; and when once introduced and fairly tested, will be universally cultivated by those who depend much upon grazing and feeding sheep, to which this part of the State is particularly adapted.

Bridgeport, Vt.

J. R.

IMPORTATION OF EUROPEAN CATTLE.

UNDER this head the *Genesee Farmer* for March, publishes the following:

England imports cattle from Continental Europe, particularly from Holland and Belgium. A correspondent of the *St. Louis Evening News* says:

"Thus it is. England imports fine cattle from the continent of Europe, and the United States import fine cattle from England. Yet there is no great inconsistency in this. English stock growers get cattle from abroad to cross with their fine breeds, knowing that in this way alone the superiority of stock may be preserved. But we import all the time from England, and cross with the inferior stock of this country. After a while we will get our native stock elevated; but it will have an English sameness about it. Why should not the next importations be from France, Holland, and Belgium? Having a good supply of the best English breeds, if we obtain also the best continental stock, we shall no longer be dependent on England for improved crosses. The best milkers in the world

are found in France—and an importation from Flanders or Limousin we think would be the best modern speculation in fine stock."

We are informed that the suggestions advanced above are about to be carried into practical effect on an extensive scale in Missouri. One of the most extensive growers of stock in the neighborhood of St. Louis, (Charles L. Hunt, the Belgian Consul there,) some time since opened a correspondence with parties in Europe for such information on the subject as was desired by persons desirous of importing here. The Belgian government he has also been writing to. Agriculture there is under the special supervision of the official authorities. The government directly interests itself in the improvement of breeds of horses, cattle, swine, and whatever else concerns the agricultural welfare. Fine stallions, bulls, &c., are procured by importation or otherwise, and stationed in the various Provinces for the farmers generally to breed from. There is a separate bureau of their public affairs, to overlook and improve the agricultural and stock-raising interests of the kingdom. In reply to Mr. Hunt's letters soliciting information as to the quality and price of horses, cattle, &c., the Belgian Minister said that instructions had been sent out to all the Provinces, and that as soon as returns could be had the result would be communicated to him. He was at the same time assured that the Belgian government felt gratified with the friendly purpose manifested, and that every facility would be afforded by that government to the people of Missouri in the purchase and importation of Belgian stock. The information desired by Mr. Hunt was carefully collected, and after collation so as to get the average price of the animals specified, and the aggregate of quality, the result was communicated to him in the following brief and perspicuous document:

"BRUXELLES, Dec. 15, 1853.

"MONSIEUR LE CONSUL:—I have the honor of addressing you a notice on the cattle, horses, and sheep of Belgium. In this notice you will find answers to the last questions propounded in your letter of the 12th of September last, relating to the qualities, shape, and price of the above-named animals.

"I am much obliged to you, M. le Consul, for the good intentions which caused you to ask me these questions; and I renew the assurance of my distinguished consideration.

"The Minister of Foreign Affairs.

"(Signed.) H. DE BROKERE.

"To M. C. L. Hunt, Consul de Belgique, St. Louis."

Mr. Hunt is organizing an association, with a large capital, for the express purpose of importing stock from Belgium and Germany. By the middle of April, the commission, it is expected, will be ready to start to Europe to make the purchases. The prices of cattle named vary from \$50 to \$300 a head in Belgium.

We are very much surprised to find the above article copied by our excellent contemporary, and with an air that seems to sanction the enterprise. Now, we can assure the people of St. Louis in particular, and of Missouri in general, that they could not well do a more foolish thing than to import Dutch, French, and Belgium cattle. It would be in fact worse than throwing the money away; for the animals on arrival at St. Louis, would not be worth the cost of their freight, to say nothing of other expenses. The cattle of these countries are no better in any single point, than the good native cattle of the United States. They are not imported into England for the purpose of improving the English breed, but for beef and other purposes. Yet English cattle are taken to the above countries at high prices, for the express purpose of improving their native stocks. The *very best* of

continental stock are not equal to the *third* best breed of England.

We have often imported the best Dutch, Flemish, French, and Spanish cows into America; and they can now be found pure bred, or nearly so, from the Canadas to Louisiana. Yet ask any good judge of stock whether they are any improvement to our native breed, of which they are in a measure the foundation? The answer will be an emphatic—No.

The Dutch cows of certain breeds give a *large quantity*, but a *poor quality* of milk; so does the English Yorkshire, and thousands of native American cows. But when the Dutch have done milking, it costs nearly as much to fatten them as they are worth. Not so with a good Short-horn or Devon. When properly bred, they will give large messes of rich milk, and when dried off to fatten, they take on flesh very rapidly, and pay the feeder a good profit.

Certain French and Flemish, or Belgian cows give rich milk, but no richer than the Devon or even some Short-horns. Where is there a cow of either of the former breeds that will yield a pound of well-worked, sweet, rich butter, from four to six quarts of milk, as the Devon have repeatedly done? Where is there a cow of these breeds which will produce such oxen and beef as the Devon? *No where*. We challenge the world to beat the Devon ox.

Where is the continental breed that will produce a fatted steer at four years old, equal to a Short-horn steer at two years old? Or a fatted ox at six or even seven year old, equal to a Short-horn at four years old? The latter at the same time not costing over half the price of the former to rear and feed. We do believe, sincerely, that there is scarce a continental breed unimproved by a cross with the English, that can be made to produce beef at two to four years old, at twice what it would cost to do it with a fine well-bred Short-horn or Devon. If this were not so, why do we find the continental nations, France, Belgium, Holland, Spain, Prussia, and even Russia, importing English cattle and horses in large numbers, for the purpose of improving their own? And why is it that these animals and their progeny take all the prizes at a general stock show? We have repeatedly looked over the prize lists of agricultural shows of France and Prussia, and find that the English cattle almost invariably took precedence. In addition to this, we have conversed with many intelligent stock breeders of these nations, and they almost invariably admit the superiority of English cattle.

We want nothing of the stock kind from the continent now, except the Rambouillet and the Saxony sheep; and we even find many highly intelligent American flock-masters, who will not admit that these are an improvement, except in size, and consequent weight of fleece.

An attempt has recently been made to import the French Norman horse, with a view of improving our own breed. The Norman horse has been bred in Canada for more than two centuries already; and a highly useful and hardy horse he is too; and often a swift trotter. We, however, prefer a stout compact English thorough-bred, from fifteen and a half to sixteen hands high, to improve our horses. Such a horse was imported Messenger; and it would be impossible to produce a superior stock to that

he left for the road, and the general work of an American farmer.

A few words now on the subject of stock importations. For three years past our countrymen have taken it up with great spirit, and to a certain extent it was required; but like pitching into railroads, banks, land, and other speculations, we fear they are now carrying the thing to an extreme; and that at the present demand and high price of money, there will a reaction and considerable losses on the later importations. Would it not be better to pause a while now, and see whether what has already been done in this way returns a fair profit? We can buy the choicest improved cattle, horses, sheep, swine, &c., bred here, equal to most of the best imported, at from one one-tenth to one-half of the cost of importing. Why not use the American bred then? Their pedigree, their quality, and their forms, are equal to the imported. By American bred we now mean Stud or Herd-Book animals only, and not what is usually called native.

The above is our candid view of stock importations; but if we are in error, we shall be happy to be corrected; and would gladly and heartily welcome to our shores any thing from the continent of Europe, which was *in reality an improvement*. We stand clear of all stock cliques, and only express a free and independent opinion; yet it is not a hasty and ill-considered opinion; but one made up after careful thought and long study, and more than twenty years experience in these matters.

A COMPOST HEAP.

MR. A. RECUEL, of Tarboro', N. C., gives us the following description of one of his methods of making a compost heap: First, a layer of fence scrapings, some six inches deep. Over this a load of stable manure, and then another layer of the fence scrapings. Next spread on a bushel of powdered charcoal, covered with a third layer of the scrapings. Over this put half a peck or so of salt—refuse salt from fish or meat barrels, if this is at hand—and add a fourth covering of earth, making in all about forty-five loads, the greater portion being the fence scrapings. The heap is then covered over with five or six loads of loose muck from the woods, consisting of decayed leaves and vegetable mold. The heap should lie six to twelve weeks, and then be thoroughly worked over with the fork and shovel.

This would be a very good compost if the fence scrapings are rich in vegetable matter, but otherwise we should recommend a less quantity of the earth.

HOW SHALL SHORT-HORNS BE IMPROVED?

WE extract the following from a private letter enclosing a subscription, and take the liberty to insert it.

I notice in your article headed as above, that you request those who have animals they consider superior in the fore-rib, girth round the heart, full in the crops, and with fine shoulders, to inform you of the fact. I have the Short-horn bull Grand Duke, calved the 24th February, 1850, got by Duke of Wellington (3654) E. H. B.; imported by MR. GEORGE VAIL; dam, Victoria 1st, bred by MR. VAIL. This animal possesses in a high degree the valuable qualities of the Short-horn cattle, a brilliant and beautiful eye, and *in my judgement*, as good shoulders

and as full crops as any Devon in the country. Coming in direct line from Mr. BATES' celebrated premium Oxford cow, of the Duchess tribe, and from the Princess tribe bull, Belvidere, he has inherited many of the characteristics of each tribe, and has been greatly benefited by the cross.

J. WYMAN JONES.

Utica, N. Y., Feb. 22, 1854.

When we learn the existence of a sufficient number of Short-horns with superior shoulders, &c., to render it an object, we shall then make our proposition known to their owners. In the meanwhile, we would recommend if other points are good, to give them the preference in breeding. It will also be an object to get a more oblique shoulder—like the thorough-bred horse—that of the Short-horn being rather too perpendicular for the fineness desired.

For the American Agriculturist.

A WORD ON "IMPROVED SUPER-PHOSPHATE."

CAN New-England farmers profitably purchase "Improved Super-phosphate of Lime," and other manures of this genus, at \$45 to \$50 per ton?

I hear a perfect acclamation of responsive yeas from all sorts of farmers. I am very much obliged for the prompt reply. But, Mr. Editor, I should be very much gratified if, through the columns of your paper, next winter we could get an accurate report of a well-planned and thoroughly executed experiment from every purchaser of any of the varieties of manufactured manures, going to test the character of the investment, so that every reader could make up his mind beyond a cavil as to the propriety of making a purchase next spring. A manufacturer of a respectable article could well afford to make a discount of 25 per cent. to every purchaser who would make a proper report, and the public would be greatly instructed as to the relative value of the wares in market. Advertising is an art, and the successful trials of any of the land medicines are industriously circulated, and our good friends whose patrimonial acres have been thoroughly exhausted by continuous outgo and rare income, are made to rejoice in the belief that the expenditure of some forty shillings in a wonderful preparation, that can be applied with a great spoon by a little boy, with no expense, will resuscitate one of these worn acres and make it yield with the wondrous profusion of a virgin soil. *Nobody is interested to chronicle the failures.* Now, Mr. Editor, I hold the opinion that there is a kind of obligation upon farmers, in the present blind state of agricultural science, to do individually what they can, to add to the fund of agricultural knowledge, and to protect one the other from harm and loss, and to put each the other in the way of benefit. Now, if the users of these made manures, purchased in New-York and elsewhere, will each furnish your columns with a single well-executed experiment, offering a fair test of the article used as compared with Peruvian guano and its effect in the absence of all manure, there will be *much less*, or *much more*, money spent in the spring of 1855, for "Improved Super-phosphate of Lime" and its brethren.

D.
Brooklyn, Ct.

We approve of the above suggestions, and shall be glad to receive any such communications. We will add that all reports of experiments should particularly describe the *kind of soil*, and its former treatment. What is valuable on one kind of soil may be worthless upon another.

GUANO DISCOVERY.—The *Charleston Standard* says—"A friend from Florida assures us that he has discovered a small guano island upon the western coast of Florida."

GUANO IN BALTIMORE.—The *Baltimore Patriot* says the amount of guano which will be imported into that city the present year, will probably reach 60,000 tons, costing three millions of dollars.

For the American Agriculturist.

CUT FEED.

THE course which I pursue in cutting and preparing feed is as follows: rye straw, hay, and corn stalks are the only feed that I ever cut. It is necessary to have some ground feed to put with these; rye, corn, and oats, in equal parts and ground, make good meal for a cut mess. I then cut my straw, stalks, &c., three-fourths of an inch long, and mix in a tight box, and then cover with a lid to keep in all steam, for the mess must be wet up with boiling water. It should be mixed six to twelve hours before fed, because rye straw is stiff and pricks the mouth if not moistened and softened with boiling water. If the steam is confined to it for a while, it becomes soft and palatable. For working oxen and all laboring teams, grain should be ground, that they may get the whole nutriment. The meal should be mixed with something coarse to make it digestible.

A. L. SMITH.

Nicholas, Tioga Co., N. Y.

SHOEING HORSES.

MR. CHARLES PERCIVAL, veterinary surgeon of the Royal artillery, furnishes the following communication to one of the Dublin papers:

I have lately been devoting much attention to shoeing, and flatter myself that the horses under my care are as well shod as any in her Majesty's service.

The shoe I found in use here was made concave next to the foot, and on the ground surface, than which, in my opinion, nothing could be worse. This shoe I have had reversed, making the latter as concave as the foot will possibly admit of, leaving only sufficient room between the shoe and the foot, for the picker to pass freely round, to remove dirt, &c. To the heels of the shoe I have given an inclined plane outwards on the foot surface, with three nails on the inside and four on the outside. The heels, instead of being cut off straight, are well sloped, and about the same thickness as the toe. The shoe, one-third as thick as the heel as recommended by the late professor, the majority of our horses could not travel in. There are many pernicious practices which smiths in general, if left to themselves, fall into, viz:

1. Mutilating the frogs by improper cutting. I have at length got my farriers to understand that the only part of the frog which ever requires cutting, unless ragged, is the point, to prevent the sensible frog being bruised between it and the coffin bone.

2. Inflicting serious injury to the crust by an improper use of the rasp, but especially the coarse side of it.

3. In fitting the shoe, by cutting too much out of the crust at the toe to admit the clip. The shoe is consequently set too far back, instead of being fitted full to the crust, afterwards rasping away the crust, making the foot, in fact, to fit the shoe instead of the shoe to fit the foot. This is a faulty practice, and very seriously so, which smiths in general are apt to fall into; one, too, which, renders the crust shelly, for that part into which the nails are driven from time to time is in this way rendered weak.

4. In turning the shoes, smiths do not in general attend sufficiently to beveling or sloping the edge of the shoe from the foot to the ground surface, which I consider of great importance, if horses are given to cut or interfere in their action.

5. Cutting the heels of the shoe off straight. This is also a very bad practice. If well sloped, like a shoe for hunting, to which there cannot be any objection, they are less liable to be pulled off by the hind shoe catching in them, and

contribute more to safety of both horse and rider.

6. Leaving the inner edges of the hind shoes at the toe sharp, which, if rounded, will in a great measure prevent over-reaches, as well as render the fore shoes less liable to be pulled off by their catching in the heels of the former. Squaring the toe of the hind shoe for horses that forge, or "carry the hammer and pincers," as it is termed, leaving the horn projecting over the shoe, in my opinion, good as a general rule not only preventing that unpleasant noise, but rendering horses less liable to over-reach and pull off their shoes, provided, however, attention be paid, to rounding the inner edge.

7. In rasping the under part of the clinches, farriers are very apt to apply the edge of the rasp improperly to the crust, forming a deep groove around the same, which cannot but be injurious to the foot, and, together with taking away too much of the crust in finishing of the foot, must have a tendency to render it shelly. Curving the shoe at the toe, after the French fashion, where horses go near the ground, I am fond of; but I cannot see any advantage in it as a general practice.

PRACTICAL DRAINING.

Outfalls for Drains.—The first grand principle in the practical department of draining is to secure a sufficient outfall from the leading of the main drain; and there are very few places where a suitable outlet cannot be obtained, if care and skill are duly exercised, for water will flow at as small an incline as two inches in one hundred yards. I say it will flow at that incline, but if more can be got so much the better; however, covered drains, if rightly conducted, should never have a smaller incline than three inches for every 50 yards, if possibly it can be had. I was lately conversing with an old experienced farmer who has had a great deal of draining, and he was convinced that five inches, for every 10 rods (that is 60 yards), was little enough to give a free and perfect flow; but I am convinced, by experience and observation, that if the drainer be careful in finishing the bottom of the drain, no expense may be incurred in obtaining a greater fall than three inches in every 50 yards. I have seen hundreds of acres drained with a fall scarcely so much, and flowed most beautifully. Yet many farmers are often mistaken by supposing that they cannot find a sufficient outfall for the proper drainage of their ground. They trust too much to the eye, which is far from being correct in judging of the levelness of ground, and should never be trusted where the least doubt is entertained. I have often seen the absurdity of doing so after the level was applied. It would greatly benefit farmers to be able to use the level in draining operations, as a surveyor may not always be at hand. This the farmer may easily acquire by paying a little care and attention to the method described in this work under its proper head. I have also recommended a level, which I am inclined to think the best for draining purposes, and which may be purchased for some fifteen shillings. Main drains or ditches in level lands should always be made as straight as possible, (experienced drainers can perform this without the least additional trouble,) as every crook must cause a check to the current of the water, and also diminish the rate of inclination. In my draining operations, I lately straightened an old ditch, to secure a sufficient outfall from a main drain. The old water-course was 1200 feet long, and the fall one inch in 100 feet. After measuring the length of the new course, it was only 800 feet long; that was 400 feet distorted, and of course the rate of inclination was increased to one half-inch more in the 100 feet. This proves the great use of drains being made straight in flat-lying lands. Outfalls from main drains should be scoured regularly, as the mouths of leading drains should always be kept clear from any encumbrance; even the mud taken out of the ditches, and laid on the land, would repay the

expenses of the cleaning, a great part of it being swept off the land by great rains, and must be composed of the finest particles of soil and manure. A farmer lately told me that he had now chosen a system which cost him a mere trifle compared with the old practice, when he allowed the ditches to be nearly filled up before he cleaned them. It was simply done by scouring the ditches often, and never allowing them to get deep with mud, or any encumbrance whatever. This is much better for both fences and drains, as it is an essential point in every system of draining not to allow water to stand in drains in a stagnant state, but to let it have a free flow at any season of the year, otherwise the drains may be said to be partially inefficient; for drains can never be perfect if their outlet is not sufficient. Outfalls and main drains must be made perfect, to secure a free flow at all times, from the smaller ones, although they should be carried across fields for a great distance. To uphold the many advantages which depend on its sufficiency, an act of Parliament was lately passed, which provides proper outfalls for drains from any property whatever.

Leading or Main Drains.—Before commencing to drain a field, the first requisite is to arrange the position of the main drain, which should be carried through the lowest part of the greatest hollow, wherever they may occur, whether through the middle, or along the bottom or sides. If the field slope uniformly from one end to the other, one main drain is quite sufficient; but if the surface of the field be undulated, any hollow of any considerable extent, and at any side of the field, or at the bottom of any slope to which water may incline to run, must be provided with its mains or leaders, according to the extent of land which requires to be drained. I have sometimes seen an open ditch alongside of a hedge converted into a leading drain, which is an exceedingly objectionable practice, for it exposes the ends of tile drains to frosts and other vexatious evils when it is left standing open; and when it is covered it is equally bad, as it incurs the risk of being partially or totally injured by the hedge roots. It would be wise in all cases if the drainer would so plan his operations as to keep as far off trees and fences as possible, as drains cannot be considered to be absolutely safe from the roots if placed within the range of their travels. Main drains in no case should ever be made nearer to a hedge than eighteen or twenty feet; and it may also be remembered, that a main drain should not be cut upon a hedge-ridge where there is much traffic, such as carting. Main drains should be made a few inches deeper than the small ones, especially at the lower end, to expedite the egress of the water out of the smaller ones, as it often happens to be very level on each side of the leader, I may say nine times out of ten. Mr. Parkes, consulting engineer to the English Agricultural Society, and some other authorities on draining, recommend main and small drains to be on the same level. I widely differ from their opinion. For example, suppose the depth of water to be two or three inches in the leader, and the small ones on the same level, it would assuredly check their flow, and consequently water would stand accumulated, which would make the expected cure a baneful disease; for what name can be given to an efficient drain but an artificial receptacle for stagnant water? To determine the position of main drains is an operation of great importance, when it is understood that the small ones should always run parallel to each other and in the direction of the greatest slope.—*Farmers' Herald.*

MAMMOTH HOTEL.—The St. Nicholas has now a front of 300 feet on Broadway, and a depth of 200 feet. It runs along three streets; has 600 rooms, (including 150 suites for families;) is lighted with two thousand gas-lights; employs 275 servants; has two miles of halls and corridors; contains thirty miles of piping; is protected from fire and robbery by a night and day

police; and lacks nothing which can minister to comfort and luxury in any department.

THE FISH-HAWK.

SQUAM BEACH, N. J., March 19, 1854.

As this is the season for the return to us of the Fish-Hawk or Osprey, (*Fulco Haliæetus*), I beg to enclose you for publication the "Fisherman's Hymn" to this famous bird, which I think no less spirited than appropriate. It is often sang, and is highly popular among us.

In the entertaining "Journal of a Farmer's Wife," which appeared in a few of the first numbers of your last volume, and which I much regret was discontinued, I recollect the following allusion to this bird:

"Hearing a terrible cackling among the poultry in a field adjoining their yard, I ran out to see what was the matter. A large hawk had alighted upon a fine young rooster, and was about to carry him off, when our old terrier came to the rescue. She jumped upon his back before he could rise with his prey, and with a single grip upon the neck broke it short off, as she would that of a rat—killing him instantly. The hawk was a bold fellow certainly, to make such an attack so near the house, and must have been very hungry; he has paid dearly for his temerity. I wish we lived a little nearer the sea-shore, where there is a law to preserve fish-hawks, on account of their driving off the hen-hawks. It is only occasionally that the former find their way up our little river, following the tide in pursuit of the incoming fish; and then they are frequently shot by the worthless sportsmen who infest our neighborhood. I wish there was some law against these prowling, idle fellows, and the use of their guns."

Now, I wish to inform the fair authoress of the "Journal," that there is not only "a law to preserve fish-hawks" here, but a *superstition* among us in regard to their preservation, which is even *stronger* than "law." We believe it a lucky omen if one builds a nest on the farm, and woe be to the person that disturbs it. They are nearly as tame among us as our barn-door fowls, and they invariably "drive away the hen-hawk," being its mortal foe.

The fish-hawk arrives here usually a little before the spring equinox, and his coming is a signal for our fishermen to dip their nets. He is eagerly looked for about this time, and his first appearance hailed with delight. The following is a copy of the song alluded to. I have often seen it in print, but do not know the author.

G. R.

THE FISHERMAN'S HYMN.

The Osprey sails above the sound,
The geese are gone, the gulls are flying;
The herring shoals swarm thick around;
The nets are launched, the boats are plying.
Yo, ho, my hearts! let's seek the deep,
Raise high the song, and cheerily wish her,
Still as the bending net we sweep,
"God bless the fish-hawk, and the fisher."

She brings us fish—she brings us spring,
Good times, fair weather, warmth, and plenty;
Fine store of shad, trout, herrings, ling,
Sheep's-head and drum, and old wives' dainty.
Yo, ho, my hearts! let's seek the deep,
Ply every oar, and cheerily wish her,
Still as the bending net we sweep,
"God bless the fish-hawk and the fisher."

She rears her young on yonder tree;
She leaves her faithful mate to mind 'em;
Like us, for fish, she sails to sea,
And plunging shows us where to find 'em.
Yo, ho, my hearts! let's seek the deep,
Ply every oar, and cheerily wish her,
While the slow-bending net we sweep,
"God bless the fish-hawk and the fisher."

Horticultural Department.

TO HORTICULTURISTS.—Our weekly issue of so large a journal, gives us ample room to devote to the different departments of cultivation, and we have commenced with this volume, to allot a separate space to Horticulture. We have secured additional efficient aid in its conduction, and we invite horticulturists generally, to send in their contributions on all subjects interesting and instructive to those engaged in similar pursuits with themselves. We are receiving the leading foreign and domestic horticultural journals, and shall be abundantly able to bring promptly before our readers all that transpires, which may be new and useful.

THE CONCORD GRAPE.

PUFFING new fruits has got to be so common a business with some of our nurserymen and fruit-venders, that when we see a thing of the sort introduced with a particularly loud flourish of trumpets, we are quite apt, like the rat in the fable, to suspect that "there is something more than meal in the white heap yonder." It will be recollected that we copied a flattering account of the Concord Grape a few weeks since, and as it is now advertised by the thousand in some of the papers, at the very moderate price of five dollars a plant, we have thought it not inopportune to make some inquiry respecting this remarkable production.

We may, in this place, at once, as well as elsewhere, remark, that while no one can assist with more hearty pleasure, in the dissemination of truly valuable productions of any kind, among the people, than ourselves, we feel in duty bound to warn our friends against all sorts of empiricism in every thing that comes within our notice; and this we shall always do, regardless of any interest but that of truth and fidelity to the public good, so far as our knowledge will serve us.

Now, in relation to the Concord Grape, we learn from testimony which we consider quite reliable, that this fruit is not, in the qualities of size, flavor, and appearance, equal to what it is stated to be by propagators; but that in these particulars it is altogether exaggerated. We would not do these parties injustice; but from the fact that the remarkable fine qualities of this grape have but just broken out before the public, is it not better that the newly heralded adventurer "tarry at Jericho" another season, until its merits are more fully tested by a disinterested committee? The New-York State Agricultural Society are to hold their annual exhibition in this city next autumn. There will be a grand show of fruits on that occasion, and it will be easy to get a proper committee to give this grape a thorough examination. If it shall then prove all that is claimed for it, or even if it approach within reasonable distance of the Isabella and Catawba in flavor, instead of being "far superior" to either, and "four weeks earlier," it will be a decided achievement in pomological production, and no paper will give it more hearty support than this. But, for ourselves, we are inclined to give high priced grapes a wide berth for the present, or until their vaunted superiority to other approved fruits shall be more thoroughly tested.

WINTER RADISHES.—In order to procure these we sowed radishes broad-cast where other crops had been taken off the last of August and fore part of September last. They came up and grew luxuriantly till cold weather, when we pulled them, and selected the longest and best, and buried them in clean sand in the cellar. We have used them occasionally through the winter, and they are as fresh and palatable now, as when first put into the cellar last fall.

HORTICULTURAL SOCIETY OF NEW-YORK.

THIS Society held an adjourned business meeting on Monday evening, 20th inst., to hear the report of the committee in reference to a Spring Exhibition. They reported that they were unable to make any desirable arrangements with the Crystal Palace for a Spring Exhibition, and that Mr. BARNUM had made still more favorable proposals for holding it in the Museum, as he would permit the exhibitors to withdraw before the close of the exhibition, any plants that were in danger of being injured. It was due to Mr. BARNUM that an answer should be given to his proposition at once. Mr. REED favored the acceptance of Mr. BARNUM's generous offer; but feared if there should be any opposition from any quarter there might not be a full exhibition. Mr. HOGG coincided with the statement that Mr. BARNUM's proposition was liberal, and hoped that if the Society decided to go there, no one would withhold any plants from exhibition. After further remarks from different members, it was nearly unanimously voted to accept Mr. BARNUM's proposition. The following persons were appointed a Committee of Arrangements for the Spring show of plants: Peter B. Mead, Mr. Carpenter, P. T. Barnum, J. B. Lenoir, and Thomas Hogg, Jr.

The Premium Committee were then instructed to prepare a premium list amounting to three hundred dollars. The business meeting of the Society was then closed, and the members engaged in the conversational exercises, this being the regular evening for that meeting.

The subject of conversation for the evening, *The Vegetable Garden*, being then taken up, P. B. MEAD remarked that perhaps nothing added more to the comforts of a poor man's home, or the luxuries of a rich man's palace, than a good vegetable or fruit garden. In order to have a good garden, one should know what he is to put in the soil before he takes his spade in hand. First he would trench deep, full three feet. Good barn-yard manures, well prepared, he considered better than artificial manures. The center of the garden should be filled with melons, strawberries, &c., while the borders could be filled with grape vines, dwarf trees, currants, &c. First, he plants his peas, six inches apart; next, between the rows of peas, he sows beets. After the peas are matured, he sows turnips or plants cabbage, thus constantly occupying the soil with a change of crops. In this manner a family can furnish themselves with a full supply of excellent vegetables from a very small spot of ground.

Mr. HOGG suggested planting strawberries on the borders of a garden instead of the box. It combined the beautiful and useful.

Mr. MEAD condemned the practice of hilling up things in the garden.

Mr. BRIDGEMAN remarked that hilling up corn,

cabbage, and beans, ripened them prematurely early.

Mr. MEAD dissented, and claimed earlier maturity when not hilled up.

Mr. REED was accustomed to make hills when he would grow good vegetables.

Mr. MEAD thought the English gardeners were accustomed to hill up more than we were, at least, so said their books. The object was to ward off the rain, which prevailed in their climate.

Mr. SUTTON differed from the opinion regarding the English custom.

Mr. R. G. PARDEE's experiments led him to avoid hilling any thing in his garden, except melons and sweet potatoes.

Mr. ORANGE JUDD's experience was in favor of hilling up the corn on damp grounds, to let in air and heat. If entirely free from water, the lands could lay flat, but most of the soils around New-York were so damp as to require hilling, and so he contended no general rule was applicable to all soils as they are naturally. If gardens were all thoroughly drained—as all should be—hilling would not be desirable.

Mr. SUTTON said that if the soils were bottom-drained water would not stand on the land, and in common gardens draining was indispensable.

Mr. MEAD thought we had now got at the secret of the whole subject of good gardening, viz., under-draining.

The hour getting late, it was suggested to postpone the consideration of the subject to another evening. Adjourned for two weeks.

SQUASH—ORANGE MELON.

A FRIEND from Aikin, S. C., has sent us seeds of the above, which we have distributed as requested, and reserved a few for experiment in our own garden.

He says the squash measured 27 inches long, and 52 inches round, and matured in 92 days.

The orange melon he describes as a new variety, and as originating in the mountains of North Carolina. Its rind peels off like that of the orange, and the flavor is fine.

The white cucumber seed sent is quite common among us, and for sale at most of the seed stores. He informs us that a dyspeptic friend of his ate the white cucumber with impunity last summer and found it delicate and agreeable, while the green cucumber disagreed with him badly.

We have sent the Marrow Squash seed as desired, both to Aikin and Forkland Post-offices.

For the American Agriculturist.

THE BAKING SQUASH AND GROUND PEA.

DARLINGTON, March, 16, 1854.

MESSRS. EDITORS:—I enclose you a few seeds of what we call the Baking Squash, and of the Ground Pea. The squash is different, I think, from any you have described in your late articles on the subject of squashes. We find it a delicious vegetable, which can be easily kept through the winter. The common way of cooking is, to cut off as much as is needed, and bake in the rind in an oven. It may then be seasoned with salt and pepper to suit the taste. It is decidedly more delicate and sweet than the pumpkin.

In regard to the Ground Pea, I know nothing from experience. The supply I have on hand

for planting, I received from an enthusiastic planter, of Sumpter District—Dr. PRITS—whose valuable acquaintance I made at the Augusta Fair last year. I understand from him, that on good ground, one hundred bushels may be made to the acre. It is very valuable for hogs, and will grow and produce abundantly on ground which will not produce the common field pea.

Yours very respectfully,
JOHN P. ZIMMERMAN.

We are much obliged to our correspondent for the above seeds, and will try them in our own garden this season. We think the squash will perfect itself, but fear we are too far north for this kind of pea to ripen. We grew both the cow pea and cotton in our garden last year; neither, however, ripened well. The former bloomed abundantly, and the latter green-podded well. We think the cotton plant worth cultivating as a flower in northern gardens. It is tulip shaped, of beautiful tints, pure yellow, white, and crimson; and continued renewing and shedding its blooms fully six weeks with us.

THE CRANBERRY.

Continued from page 23.

In the cultivation of cranberries, whether on upland or lowland, it is very important that the ground should be entirely covered by the vines as soon after planting as possible, not only on account of the great saving in labor, by thus preventing the growth of grass and weeds, but also, because very little fruit is commonly produced till the vines have thus spread over the surface. At the end of three years the whole ground should be covered; but in the instances of upland culture referred to, it was not so, though the plantation had been set at least three or four years. Probably, if the roots had been put but twelve or eighteen inches apart each way, the result of the experiments would have been more satisfactory in this respect. As it was, however, the yield in 1852, was one bushel to the square rod, when cranberries were selling readily at four dollars per bushel.

But, in estimating the comparative profits of the upland and lowland cultivation, it will be borne in mind that the labor on upland is greater, and the land more valuable for other purposes. The liability to frosts, is not, however, quite so great when the cranberries are in blossom. There can be no doubt that it will grow and do well on upland, and produce too, a superior fruit; but it seems to prefer a poor, sandy soil, full of moisture, such as can be best obtained by improving swamps, which, unless used for the purpose, are nearly worthless. Half an acre of cranberries, on a very rich upland soil has been estimated by the owner to have cost him, after being set four years, and including labor, interest of land, and other expenses of cultivation, about \$300, or at the rate of nearly \$600 to the acre; whereas, it has been seen that the roughest and most unpromising swamps may be reclaimed and set with cranberries at about half that amount. If the soil be a rich loam, as in the case above mentioned, the grass and weeds struggle very hard for the mastery, while on the poor and barren sand they hardly grow at all if the ground has been properly prepared in the first instance; so that the labor of cultivation is but very little, at most, and many think that no care at all is needed. Thus, there seems to be much truth in the remark which I have often heard on the subject: "Give us sand and water enough, and we can grow cranberries to any extent." So far as my own observation extends, the fruit grown on pure white sand, is quite equal in point of size and firmness to that grown on upland. More experiments, may, however, show further advantages in its extended culture on upland.

It should be remarked that it will be well to spend sufficient time in planting the vines, to

do it properly, since they will thus get an earlier start, and sooner cover the ground. In the case of one plantation, visited during the process of transplanting, after the sand had been filled in and leveled, a line was carefully drawn and marks were made in the sand, eighteen inches one way, and one foot the other, when holes were dug three inches deep by one man with the hoe, while another followed, dropping five or six roots into each hole, and after him followed a boy who pressed the sand carefully about them. In this way, an acre was quickly planted.

No manure is needed for the cranberry. Indeed, from what has been said, it will be evident that the poorer the ground the better. In the experiments which have come under my observation, where manure was used, it caused the grasses to grow abundantly, to the injury of the cranberry plants, which were not apparently benefited by the manure. But in case of upland culture, swamp muck is often used about the vines, and with apparent profit.

In the case of vines growing naturally, it will be found advantageous to spread over them occasionally, a thin covering of sand.

Time of Planting.—If the cranberry is to be raised from seed, it may be sown in the fall or in the spring. For some reasons the latter is preferred, and the month of May is selected. It is better to crush the fruit and separate the seed from the pulp, though the latter is not necessary. The berry is sometimes crushed and mixed with sand, by which means the sowing is made more easy.

If the plants are to be propagated by cuttings, the spring is considered as preferable. The ground should be moist, but not liable to be flowed immediately after planting.

But for the usual mode of transplanting the vines, the fall is generally preferred, though there seems to be no difficulty in making them live when transplanted at any season of the year. I have known them transplanted in the middle of summer, and to live and do well. But if the planting be done in the fall, they take root in the spring and grow more vigorously the first year, than they otherwise would. For this reason, if the ground can be made ready in the fall, it is desirable to have the vines set out then, and they will thus ordinarily have the start of those planted the following spring, by two or three months. If planted in the autumn, they will also bear a little the next summer, and the crop will increase gradually till the fourth or fifth year, when it seems to attain its highest yield. Circumstances may make some difference in the length of time which must pass before a full crop is obtained, as, if the vines are much choked up by grass, and retarded in their growth by want of care. The statement made above, both as to the time ordinarily required, and as to the effect of the unfavorable circumstances alluded to, is confirmed by the experience of many who have been engaged in the cultivation of cranberries long enough to have had opportunities of extended observation on the subject. There seems to be no reason why the crop should diminish after the fifth year, nor is it certain that it will, as a general rule; yet it is evident that if, at this age, the thrifty and healthy vines have covered the whole ground, they will be likely to bear to their utmost capacity. Probably, after the seventh or eighth year, it will be found to be well to rake or stir the surface under the vines so far as it can be done, or perhaps, to spread over them a thin covering of sand or loam.

The Yield.—The yield will vary according to circumstances, but about one hundred and fifty bushels per acre will be a fair average; though an acre in full bearing will often produce more than two hundred bushels. In a very large number of cases, a bushel to the square rod has been gathered without much trouble of cultivation. In one lot visited by me, more than three bushels to a rod, or at the rate of four hundred and eighty bushels to the acre,

on two or three rods, were obtained from very thrifty vines on a peat bottom, with a thin covering of sand. This must be regarded as a remarkable yield; and when the quality of the fruit is such as to command a ready sale at from nine to eleven dollars a barrel, which was offered for them the past season, this crop must be acknowledged to be very profitable.

Loudon remarks, that Sir Joseph Banks, after having imported the American Cranberry into England, raised, in 1831, three and a half bushels on a piece of land eighteen feet square. This is at the rate of about four hundred and sixty bushels to the acre.

It is probable, that for several years in succession, the average yield throughout the State would not be more than a hundred bushels per acre, if it were so great; being some years much more than that, and others much less, the number of bushels varying according to the accidents of frosts and winter.

The market value of this fruit will also be different in different seasons. In 1852, four dollars a bushel, for cultivated cranberries, were very readily obtained. During the past season, the price has ranged from two to four dollars a bushel, according to the quality; raising and falling, also, to some extent, according to the demand and the supply in the market.

The demand is rapidly increasing, and there can be little doubt that it will continue to increase as the superior quality of the cranberry, in some sections of this State, becomes better known. And if, owing to any circumstances, as competition from abroad, the value should fall to one dollar per bushel, it would still be a profitable and desirable product, especially when it is left to occupy its favorite barren and otherwise unproductive swamps and dead sands. There are few crops which, with the same amount of labor, will make so good a return.

Varieties.—There are but two species of the cranberry, properly so called, which are of much practical value, as has been already intimated in speaking of the natural history of this plant; yet of each species there may be several varieties, more or less permanent, according to the circumstances and manner in which they were produced, just as there are varieties of the apple produced by the accidents of cultivation, and which are not permanent; as, for example, if we plant the seeds of any improved and cultivated variety, like the Baldwin, we cannot depend upon having, from the seedling, the same variety as that from which the seeds were taken.

The varieties of the cranberry have not been distinctly named, as most varieties of the apple have, and must be described, and can only be distinguished, by difference in shape and color. It is very important that the most approved varieties should be selected for cultivation, as they command a much higher price in the market. The large, round and black cranberry of Cape Cod and Cape Ann, sells for nearly a third more than the oblong and softer variety, more common in other parts of the State. It might properly be called the Black cranberry, so nearly does its beautifully shaded, deep red, approach to black. It is very hard, nearly as hard as a Baldwin apple, and will bear transportation to any distance. It keeps well through the winter, and even, in some cases, into the succeeding summer. Indeed, with a little care, good cranberries may be kept a much longer time, either dry in bottles, corked so as to exclude the air, or in bottles filled with pure spring water.

It is probable that the superior qualities of this variety arise, in a great measure, from peculiarities of soil and situation, and from the fact that it can remain on the vines till it is fully ripe, without danger from frost. The proximity of the sea, also, may have much to do with this superiority. From extended inquiries into the quality of the same variety, in different localities, I have been led to the conclusion that the sea air is, for reasons alluded to above, highly conducive to its perfect development.

There is an oblong cranberry, more common

in the low, wet bogs of the country, softer than that which has been described, of a loose and rather watery texture, and shrinking much more in cooking. It is sometimes shaped like an oblong pear. Its color is a beautiful vermilion. It seems to be much more sensitive, and liable to injury by the frost, than the variety just described. These varieties are not constant, nor are they very perfectly marked, each occasionally having the characteristics of the other. Thus the black cranberry sometimes, though rarely, assumes an oblong or pear shape, and the oblong is sometimes found harder and better than it generally is, and of a deeper red. The fruit, indeed, assumes every conceivable shade and shape, from the black globular, to the light and oblong or pear-shaped.—*C. L. Flint's First Annual Report to Massachusetts Board of Agriculture.*

(To be continued.)

PRUNING GENERALLY.

EVERY shoot which is cut or stopped, every bud or leaf that is rubbed off, every wound or incision made in the bark, and "operating" on the roots, may be implied and classed under this head, and any one may be a *general pruner* without understanding more about the nature of pruning than the man in the moon, who, as I was taught, was a wicked man indeed, and was hung up in the moon, with his axe over his shoulder, for cutting trees on the Sabbath-day, as a warning to all boys who might be tempted, by the evil spirit, to cut sticks, fishing-rods, or riding-whips, on the seventh day of the week.

The effects produced by a *general pruner* may be good, or no good, as it happens; but the effects produced by *pruning on principles* are, and necessarily must be, as certain as those principles are permanent. If any of us prune with a view of doing harm to a plant, the effect will be as certain as the principle of evil is abroad in the world, and so on, with every specific principle; therefore, it may do some good to write, now and then, to remind the world at large about the general and specific effects of pruning on right principles, if only to lessen the chances of doing harm by those who must prune away at something or other every year of their lives, whether they know the right way of pruning different plants or not. There is nothing done within the garden, in which a man, without practice, is more likely to be led astray by loose readings than in the doings of the pruner; the very plan that will answer for one plant, and cause it to fruit or flower, or take to a particular form or shape, may hinder the next plant from flowering at all, and put it out of shape altogether; therefore it is quite certain that the knowledge that would distinguish the difference between pruning this plant and that plant, can never be known to all persons at the same time; and on that very account serving gardeners will never cease from the face of the earth, so that every book called "Every man his own gardener," or doctor either, is just as much as to say, every man has a fool for his gardener, or his patient, and as long as such books are in the world we must battle on to keep down such foolishness.

The different kinds of pruning are intended to produce particular effects on the root of the plant. The food of plants is gathered by the roots, and sent up to the leaves, to be changed by them into a matter from which other leaves are made, as well as branches, flowers, fruit, wood, and all. Therefore, by pruning off more or less of the leaves, branches, or roots, we have the power of regulating what they produce, and the regularity of the plant as well. This wonderful power should not be intrusted to any one who was likely to abuse it from not knowing the delicate process by which nature regulates the movements of the organs by which a plant is formed. The quantity and quality of leaves, flowers, fruit, and timber, depend on the skill of the pruner fully as much as they do on the action of the leaves and branches, and ac-

cording to that skill the quantities and qualities are diminished or increased in the same ratio.

If you were asked to put the whole strength of a tree into three particular branches pointed out to you, what is more natural, in the absence of practical knowledge, than that you would prune off all the rest of the branches, as many people would do who ought to know better? You heard in a lecture, or read in a book—perhaps from this very pen—that if so many branches are cut off from a tree, the sap that would be expended in feeding them would go to nourish the remaining branches. All this is right, and proper; but your application of the principle, or rule, may be much worse for your tree than no application at all. Suppose that your tree had been looking badly for a long while, and that after digging round it the looks are no better, and the rotten manure makes it look worse still; it is, in fact, in soil which does not suit it, or the roots have suffered a violent check, or the bark has got what we call hide-bound, and the circulation is languid in consequence. Now, if you apply the favourite remedy for throwing the whole strength of the tree into two or three of the branches by cutting off the rest of the branches, the chances are that no strength will remain in it to be forced this or that way, because pruning cannot alter the nature of the soil, or increase the vigor of the roots, neither will it loosen the tightness of the bark. According to my experience, the most confirmed errors among amateur pruners lies in this question; they put faith and great stress on a thing they do not understand, because some popular book or writer said that the thing is so good in a particular case, or in general cases. Quack doctors kill people, as sure as ever Dr. Hornbrook did, by the same rule. A certain bolus cured a certain individual, or he cured of himself, in spite of it, and that bolus must be the "universal medicine" for all comers, until the last comer takes the man of pills to his long home without ceremony. No; all the pruning in the world will not cure a tree of any disease that is of the stint family, or, if it does, the tree was not so much stunted as it looked to be.

The only sure and quickest remedy for a really stunted tree, be it oak or apple, old or young, is to head it down to near the ground, or graft, and to give it one more chance to renew its strength. Nevertheless, a young tree which appears to be stunted by the too much exposure of the situation, may, in fact, turn out in the end to be in better condition than one of the same age and kind that has been too much nursed, and is grown too fast in consequence; all the difference depends on the after-management.

A fast man prefers a fast-growing tree to cover his walls, or, in its turn, to become so much of "the walls of old England;" but, unless he is a good pruner, his wall-trees soon get bare at the bottom by over strength, while the "walls" of England go to the bottom for want of proper strength; while the slow and sure gardener provides for the covering of his allotted spaces as his trees advance; and the slow and easy forester, who is sure to "ease her" at the proper time, will cut down the stunted Oak to the surface of the ground when it is done with the nurse, and thus secures a sapling so full of sap, from so many roots, that it will neither get hide-bound by the exposure of the situation, nor suffer from the necessary pruning, half so soon as the one that was more promising at first to an unpractised eye. All this time, the man who would not prune or lop off a bough for the world, looks upon our men, both fast and slow, as next thing to being *daft*; but, between the two, they so managed at last as to confine him to the park, and to the care of the park ranger, where he may practise the art of no-pruning until it is discovered that a tree may be made into a specimen as well as a Tom Thumb. While this is being settled, let us, who have neither park nor paddock, learn and remember how any tree, or shrub, or bush, may best be grown into spec-

imens of their kinds, whether they are to be as timber trees in the boundary, or for their looks in the front rows or on the grass, or whether they are over the fence on the other side, where Mr. Errington is looking daggers at us, and where we shall call on him when we get all around, notwithstanding.

Now, what is the best standard pattern for a timber tree—a Maypole, a broomstick, or the leg of a Cochinchina cockerel, or what? The leg, certainly, to begin with, because it is feathered to the ground, and also because it is crooked at the knee, and they want knee timber in the navy; so we have two main points to begin with. They also want straight timber for building, and the broom-stick is as straight as can be, but the broom head will never do at all, if we aspire to a Maypole; and if not, why not, or how are you to help it? That is just what I am driving at; and if I do not drive to it, and straight through it, before I finish, they will never make me a royal forester, or give me a cottage near a wood.

Being feathered down to the ground is a good beginning for a specimen tree of any kind, but in those for timber it is not to be expected always, the breed having a good deal to do with such feathers; and where it is the nature of the tree to be low-feathered at first, if it stood still for awhile, and moped like a crowing cockerel, or like the young oak, as some believed, when it started afresh it may have lost the feathering principle, and that rather by the force of the sap than by the force of circumstances; and we are not allowed to choose when a young tree darts off on a naked leg, other points being favorable, or to indulge in the fancy should it show the feather.

After spray and small feathering, it is just as natural for a timber tree to make some boughs larger than others, as it is for a cock or hen to make tail feathers; and if the larger boughs expend that which ought to go for making straight timber, as they most would, or if the tail feathers lower the fancy value of the birds, we must lower the boughs, by stopping them in time, for we cannot pull them out as they do the feathers. Stopping, therefore, is the very first and most essential step in pruning timber trees, and many other trees, if not all trees; and when a young tree is in full vigor, if the leading bud of a larger side-branch is broken off at the right time—that is in June or July, when the force of the sap is the strongest—it will be enough, for the immediate effect of this stopping is to direct the force into other buds on this branch which might otherwise lie dormant; and while this moving is in progress, the force is partly expended in adding to that which pushes on the leader at the top of the tree; but stopping may be done any day in the year, although not so telling at other times. If the first side-bud that starts on a stopped branch is allowed to go on, and the rest are not allowed to go on, but are stopped at different lengths to make feathers, or feathery branches, we have the first foundation quite sure for a piece of knee timber at a future day, and the angle of the knee will be according to the angle at which it is natural for a side-branch to grow out of a main branch of that particular tree; some trees throw out their side-branches at sharp, and some at flat angles, and others at all angles between the two; so that in a well-regulated wood or forest, all kinds of angles ought to be had for the different parts for which knee timber is in request.

Another stopping, and for a very different purpose, may be made in April, or any time in the spring, in order to husband a scanty supply of sap, and to give more time for a newly-transplanted tree to make fresh roots before the demand on them increases by the length of day, and the greater heat of the sun.—*Farmers' Herald.*

ONE of the greatest charms in books is, that we see in them that others have suffered what we have,

American Agriculturist.

New-York, Wednesday, March 29, 1854

BOUND VOLUMES.—We have a few sets (26 numbers) of volume eleventh, bound and unbound. The price, at the office, of the unbound volumes is \$1.00. The bound volumes are neatly put up in cloth covers, gilt backs, at \$1.50.

We can also furnish the covers separately, gilt and all ready for putting in the paper, for twenty-five cents each. With the covers thus prepared, any bookbinder can complete the binding for twenty-five cents. Volumes sent to the office will be bound complete for fifty cents.

We are having printed a new edition of the first ten annual volumes of the monthly *Agric. Cult.*, which can be supplied for \$1.25 per volume or \$10 for the set of ten volumes.

"SLICKING UP" THE FARM.

WE do love to pull stumps in the spring of the year, when they are sufficiently rotten, and hang in the ground by a single snag, which the retiring frost has left loose enough for a stout yoke of oxen, or a vigorous pair of horses, with a taught chain, and a long pull, and a strong pull, and a pull altogether, to draw out at one single, earnest effort! How cheerful, in a sunny day in March, or April, to go into a meadow, or pasture, or plow lot, dotted over with huge stumps, that have stood there black, charred, and rotting, ever since the stalworth boys that now go out afield with you were babies, disfiguring the ground, a perpetual eyesore, and a bane to all neat farming, and tear them out one after the other, roll them into heaps, and after drying a few days, set fire to, and see them melt down into a low heap of ashes! How clean, and smooth, and fresh the land looks afterwards; and how comfortable you feel that so much more of a bad job is got along with. Having cleared many a hundred acres of forest land, we feel as if every stump we draw from the ground was another good deed added to a life not altogether without endeavors. While we live, and own a farm, we expect to have a bout at stump pulling every year; and it exhilarates our sedate manhood equally as when we played a game at ball in our long-passed boyhood.

Rock blasting, and stone lifting, where they are too plenty, is also a cheerful, although laborious operation, none the less improving in its effects than stump-pulling. March and April are the best months for either of these, as the frost of winter invariably loosens, and makes them come easier than at other seasons.

FARMS FOR SALE.—What is the matter with the farmers in Eastern Massachusetts? A single Boston paper, of last week, contains advertisements of between seventy and eighty farms for sale. We do not find as many thus advertised in all the New-York papers put together. Perhaps the reason is that the shrewd Yankees have learned the advantage of advertising better than others. We frequently have inquiries for farms in the vicinity of New-York; and we suggest to those who are anxious to dispose of their lands to make the fact known through our ad-

vertising columns. A few dollars thus spent may add hundreds to the price they will obtain, by bringing a larger number of competing customers. Such advertisements should describe the location, quality of land, nearness to markets, churches, schools, &c., and especially give the price and terms of payment, as this will save much trouble both to buyer and seller.

SWEET CORN FOR FATTENING.

AN intelligent farmer in Onondaga, plants many acres of sweet corn for fattening hogs. The greater amount of saccharine matter in it, is said to add to the sweetness of the pork made upon it. It is highly relished by both fowls and animals, and is said to be more easily digested than yellow corn.

We insert the above, which we find in an exchange paper, not however to endorse it, but for the purpose of correcting conclusions that might be erroneously drawn from it. In the first place, we believe sweet corn is a poor yielder as to quantity. There may be exceptions to this, instances of which we shall be happy to receive from our correspondents, but the general result we believe to be as we have stated.

Secondly, saccharine matter, sugar, starch, and oily substances are essentially the same in composition, the elements being absolutely the same, the difference being only a slight difference in the proportion. Starch and oily substances exist ready formed in considerable quantities in vegetables. The vegetable fats, when taken into the stomach, are probably at once carried to their appropriate cells in the animal system, without the process of rearrangement by the vital action of digestion; and the starch may be converted into fat, perhaps quite as easily as sugar. The ordinary varieties of corn contain less saccharine matter, but probably a much greater proportion of both fat and starch, and possibly may be better adapted for fattening animals, bushel for bushel, than the choicest varieties of sweet corn. This much is our conjecture. If any of our correspondents can afford us detailed and accurate experiments on this subject, we shall be happy to receive and chronicle them.

TAKE CARE OF THE FEET.

WATER-PROOF PASTE AND RUST PREVENTOR.

A VERY good paste for this purpose, can be made by melting together lard and rosin. The exact proportions are not material. For leather, say one part of rosin and three parts of lard. For coating any kind of metal to prevent rusting, the rosin may constitute about one-third part of the mixture.

This, like all other water-proof mixtures, should only be applied to the soles of boots or shoes, and the lower parts of the upper leather, except where the boot is to be constantly immersed in water. The more open and porous the upper part of the foot of a boot or shoe can be, the better; for the perspiration—which from every person's feet amounts often to half a pint or more daily—will pass more freely through the leather and escape, and leave the feet dry and warm, instead of damp and cold, as they will invariably be, if entirely surrounded with air-tight leather or rubber.

Nothing conduces more to freedom from colds, and consequent good health, than a proper care

of the feet. Few persons grease the soles of shoes, while in reality this part needs most to be guarded against water. Sole-leather is usually quite porous, admitting water freely, and is almost always upon damp or wet ground.

The above preparation is most admirable for protecting farm implements from rust, as well as household utensils, especially knives and forks which are seldom used. A thin coating of lard and rosin, is a much more effectual and certain protection than the usual method of keeping them wrapped in dry flannel.

IMPROVED STOCK FOR SALE.

WE desire to call particular attention to the advertisement of Mr. LEWIS G. MORRIS and Mr. NOEL J. BECAR. These gentlemen have repeatedly visited Europe for the purpose of making their selections, which they have done with great care and at the highest prices. They have also given the most careful attention to the breeding of these noble animals since their arrival in this country, and have been quite successful in their progeny. Their establishments are models to American breeders, and it affords us sincere pleasure to recommend them in unqualified terms. Those in search of improved stock, will do well before purchasing to first call on Messrs. MORRIS & BECAR, and examine their superb flocks and herds. Mount Fordham and Smith Town are delightfully situated, and it is an agreeable ride to either place. The former is easily reached in one hour from the City Hall.

GRAVEL WALL.—Mr. J. M., of Indiana, requests us to "republish a description of a 'gravel wall house' from No. 9 of the *Agricultor*." We do not find any such article in that number. Mr. M. will find a review of FOWLER'S work on this subject on page 265, No. 17, Vol. 11, of the *Agriculturist*. We do not recommend this style of building either for cheapness, convenience, or durability. Any person, however, wishing to investigate the matter further, can procure the work by addressing Messrs. FOWLER & WELLS, of this city. We believe the price of the book is 87½ cents, sent postage free by mail.

THE BORAX WASHING RECIPE.

WE have heard a few reports from the Borax washing recipe given in a former number, most of which are very favorable. One person only has objected to it, and she says it is a great improvement for most clothes, but that where they are very much soiled, some rubbing is necessary. Mr. DAVIS of Morristown, N. J., in a postscript to a letter says:

Mrs. DAVIS wishes me to say that she has had the washing-soap made of borax, soap and water, according to the directions you gave in a former number of your paper, and that the washwoman gets through her work in much less time, and does it much better than with any other preparation she has ever had in use for washing. It readily starts the dirt and bleaches the clothes at the same time, without any apparent injury. It saves much time and work, two very important considerations in these times of poor help. This one recipe is worth years of subscription to your paper.

THE Cincinnati Price Current publishes the final report of the hogs packed in the West,

showing a net increase in the number of 333,000, being equal to fifteen per cent. over last year. The report embraces 260 points, and is the most complete ever published.

—•••—
FIRE KINDLER.—A very convenient material for kindling fires, may be made by melting together, in any iron kettle, a quantity of tar and rosin—putting in rosin enough to render the mixture moderately hard when cold—and while hot stir in a large quantity of charcoal dust, or even saw-dust. When the mass is cold, break it up with a hammer into lumps, of a convenient size, say about as large as a hen's egg. The smaller fragments produced in breaking, can be re-melted, and again broken to the required size. It will facilitate the breaking operation, to pour the mass while hot upon a flat stone or hearth, that it may spread out into a flat cake.

MAKE FARMING ATTRACTIVE TO THE YOUNG.

In no point do farmers fail more in the education of their sons and daughters, than in neglecting to make their rural homes attractive. With little beauty in or around their dwellings, with few objects upon the farm in which they have a direct personal interest, and taught by the conduct and language of those around them, that there are higher and easier paths to wealth and distinction, it is little to be wondered that so many farmers' sons long to escape from their laborious occupations and engage in commercial pursuits. Mr. C. L. FLINT, Sec. Mass. Board of Agriculture, alluded to this subject very happily in a dinner speech at the September meeting of the Norfolk County Agricultural Society. The following is an extract:

It has always seemed to me, sir, that the great want of New-England was to make farming attractive. And here I can only echo the beautiful words of your orator to-day. If we would have our children follow farming as a pursuit, we must interest them in it, and fit them to pursue it intelligently. If the mind is not engaged, the toils of the hand are irksome and tasteless. If the mind is interested, if every thought, every passion is aroused to improve and excel, no labor is wearisome, no exertion too severe. To make farming attractive to the young, they should be educated for it. And since life is short and knowledge infinite, they need not, perhaps, spend years of the best part of their lives in such studies as are necessary only to success in the law or in divinity. The time will come, when the farmer will have more ample facilities for educating himself and his children. In the meantime a thousand objects, if properly observed and brought to notice, will begin the work, and that in the very points of greatest practical importance.

Suppose the young are taught to observe the character of soils and their adaptation to different crops, the structure and nature of plants, the habits of insects injurious to vegetation, the habits of the beautiful birds so often accused of theft, the great striking peculiarities in the different breeds of animals, and the means of improving them—will they not have subjects enough to interest them in farming? They will find means of cultivating the finest fruits and ornamental trees, to beautify the house, and give it an air of neatness and comfort. A little taste in arrangement of trees and plants, added to a cultivated mind, soon finds within itself untold resources of living well and happily.

But the young, it is said, are ambitious, and cannot be satisfied with the reputation of good and successful farmers. They must go into the counting-room to make money, and be known as men of wealth, or they must embark in the

intricate studies of the law, and through that upon the greater uncertainties of politics, and achieve distinction, and, as they think, honor, (they don't always go together,) in the eyes of the world. They forget the brighter and purer reputation of conferring some permanent benefit on their country in the improvement of its agriculture. They forget that the very men who fail at farming are men who would fail at any thing else, and that their chances of success are equal in farming to what they would be in other pursuits, perhaps even greater, since the field is wider and nobler. I would rather have the reputation of doing something to improve the agriculture of my country, than to have the reputation of Napoleon.

 Written for the American Agriculturist.

REMINISCENCES OF A FARMER'S DAUGHTER. No. IV.

BY MINNIE MYRTLE.

AN "Octogenarian" thinks I must be at least three score years and ten, in order to have worn Linsey-woolsey when a child, and to have been educated so thorough a farmer's daughter in principle and practice. Well, he cannot expect a lady to tell her age, but I can assure him that Linsey-woolsey is not yet out of fashion in New-England, and scattered all over its hills and valleys yet, are those who adhere to the primitive tastes and habits of the olden time.

But I am not one of those who think that every custom which is old, is better than any which are new. I believe in progress, and I think there is great need of progress among farmers all over the land, in the way they till their soil, in the way they build their houses, and the way they manage their households. May the day never arrive when they shall become luxurious and effeminate, when they shall wish to spend a fortune in furnishing their houses, and in surrounding themselves with luxuries, which add very little to the real comfort and happiness of life.

But in most of the rural districts, there is too little attention paid to the cultivation of courteous manners and refined habits in the everyday intercourse with one another. Among many, it is considered a matter of course, that farmers should live any way—that is, that the parents should be coarse, and the children awkward, that there should be little attention paid to those formalities which are, not in reality politeness itself, but very desirable accompaniments. It is to show what can be done in the way of cultivating the habits of what is called genteel society, and at the same time retaining strength of character, and simplicity of dress, and right ideas of labor, that I have introduced the family in the old farm-house on the hill.

Those who dwelt there, were surrounded by many who associated effeminacy and a low degree of worth with order and taste, but they determined to prove that they could be farmers, and still be gentlemen and ladies. The father said that the daughters should enjoy all the advantages of education which the best schools afforded; but they must also learn every species of toil—they must do with their hands all the work of a household till it was familiar, and they could do it efficiently and expertly. This was not necessary on account of their circumstances, for they were abundantly able to procure servants, but he said they might be so situated some day that they must depend on them-

selves, and knowledge of any kind never came amiss. The same rule was made and carried into effect concerning the sons. They were told that they might go to college if they wished, but they must also learn to hold the plow and wield the scythe. I have often thought of the firmness and perseverance it required to enforce such a discipline, whilst all around were families pursuing so different a course; and children were continually saying, "others are not compelled to do so; it is hard; father and mother are cruel," &c., &c., but there was no swerving. It was an instance, though not the only one I have seen, where wealth did not enervate, and those who possessed it did not become luxurious.

Three sons preferred a college education, and were liberally supplied with the means to obtain it; but through all the years of study, the summer vacations were spent in the field with the mowers and reapers; and in the winter, if they did not choose to teach, they went into the woods and felled trees, and chopped them and sawed them when drawn to the door. Their hands were kept hardened by toil; but their heads were not on that account in danger of being left vacant, or filled with what was not substantial and enduring. Many times have I heard them express their gratitude for such a training, and attribute their success to the business habits and practical ideas of life which they thus acquired. One of them is now a distinguished professional man, and his favorite morning exercise is to saw the wood for half a dozen fires during the day; while many with the same health and strength and no more means, take a listless walk, or go without the exercise they need, and hire done what they might as well do themselves. They are all laboring earnestly to procure the means of purchasing farms upon which to educate their sons and daughters; and none of them would think any of the offices which they performed in their youth undignified or beneath their attention now. Some of them are familiar with law and politics, science and literature, and every species of learning, and say knowledge enables them to hoe corn better, and to dig potatoes, to cultivate fruit, and prepare flower-beds. There is no labor which knowledge does not aid and dignify, if applied as it may be.

But it is with the house and house-work that I intend to linger, in order to illustrate the importance of knowledge, and its influence in making pleasant the rough pathways of life. So I must introduce you more particularly to the old house, which stood on a hill far back from the road; and when I first remember, it was not painted, and had no fence around the door-yard; the barns and piggeries were not in good repair, and the green sward was covered with chips and straws, and the garden overrun with weeds. It had been the abode of those who thought these things of little consequence. They had been farmers in the rude, old-fashioned way, and lived very much like the pigs, of whom they took better care than they did of themselves. They had a bed in the best room, and in every other room besides; they swept, but seldom dusted; they cooked, and prided themselves on their "good living;" but the preparations of the Greenlander or Hottentot would be almost as palatable to one who knows what wholesome food is. They were uncouth in

their manners, and did not try to be otherwise; they dressed as well "as they could afford," they said, but the same money, with taste and skill, would have given them the appearance of dressing a hundred times better.

There was enough spent in furniture, but it was little better than wasted, because it was spoiled for want of care, and arranged with no regard to comfort or taste, yet she who presided, thought she was a pattern house-keeper, and had every thing in the nicest order. She had no system, no plan, no efficiency. I was a very little child when I used to run in there and see how things were done, and have often since thought how applicable to her was the saying, "she could work all day in half a bushel;" for she never had any thing done. She did not like rising early in the morning, therefore on washing-days, ironing-days, churning-days, and baking-days, the wash-room, kitchen, and dairy-room were in a perfect turmoil; and these days came so often, that there was no day in the week in which one of them did not come. So it was enough to make any one, young or old, abhor the very name and thought of house-work, who saw it performed as it was under her supervision.

But keeping house and doing house-work should be, and can be, pleasant to every woman; but there is no sphere in which she is called to walk, that requires her to have a mind so well disciplined and an education so thorough. We will see the transformation which is made in the old farm-house by one who is thus qualified for her office.

CLAIMS OF AGRICULTURAL PATENTS

FOR THE WEEK ENDING MARCH 14, 1854.

ROTARY CULTIVATORS.—G. B. Field, of St. Louis, Mo.: I claim the construction of the rotary cultivating cylinder, made of cutting plates or spades, and interposed pushing or clearing boards for removing the earth, as described.

I claim the arrangement of the shield plates on the shaft, for the purposes set forth.

I claim the arrangement of the rotary harrow, sustained above the ground and in the rear of the cultivating cylinder for breaking and pulverizing the falling earth.

SMUT MACHINES.—Lewis Fagin, Cincinnati, Ohio: I claim my method, or its substantial equivalent, of arranging a blowing apparatus where the upper or suction fan takes the air at the center and discharges on the periphery, to precede (on the same shaft) a scouring mill, for the purpose of taking from grain the smut, chaff, &c., before the scouring process is commenced and afterwards thoroughly scour the same: thus constituting the cleansing and scouring processes the duty of a single machine as described.

I also claim the cylinder hopper and feed pipe as arranged, or their equivalents, and for the purpose described.

I also claim the collar as arranged for the purpose described.

I also claim the guide as arranged and for the purpose described.

I also claim the scouring cones severally and collectively with their circular and horizontal grooves and perforated terraces, or their equivalent, and in combination with the conical fan and beater, as described.

FORM OF SCYTHES.—J. W. Robinson, of Kirkland, N. Y.: I claim the form which is given to the back and web of the scythe, as described, whether the web starts from the center of the back, or elsewhere except from the edge.

MOLD BOARDS OF PLOWS.—E. M. Bard, of Philadelphia, Pa.: I do not claim to be the in-

ventor of the combination of cutters or rakes with cultivators or plows, for enabling the latter to perform two functions at the same time.

I claim securing the cutters in openings formed in the mold-board at the points, and in the inclined positions outward and backward, represented so as to enable the lower forward cutters to cut and loosen the soil preparatory to its being overturned, and the other cutters to more thoroughly pulverize it as the body of earth is thrown over, and the cutters from their peculiar inclined position, to disengage themselves from weeds and other obstacles, as they pass the same, the several parts being as described.

ROTARY CULTIVATORS.—Philander Shaw, of Abington, Mass.: I claim the described method of hanging and operating the spades, &c., they being applied in one or more vibrating sets to a rotary frame, each spade being hinged to the frame and made to turn through the sector of a circle and provided with stops, and a stud to act against a stationary cam, as described, the whole being applied together and to a carriage or frame, and made to operate so as not only to dip into and raise earth, but to perform the office of impelling along on the ground the whole machine, as specified.

MACHINES FOR MAKING SHOVEL HANDLES.—R. D. Bartlett, of Bangor, Me.: I claim the combination and arrangement of the bed, the rotary holder, one or more vertical movable cutters, and one or more stationary cutters, as made to operate together and form the D or head part of the shovel handle, as specified.

And I claim the combination of the curved knife and the arc knife, so applied together as not only to allow them to be separated for the purpose of being ground, but to enable them to cut out the opening of the shovel handle, as specified.

I claim also the combination applied to the shaft of the rotary holder and gear wheel, for the purpose of operating the holder, as specified, the said combination consisting of the cam blocks, the arm, the spring bolt, its cam, and the two studs, the whole constructed and operated together, as specified.

SEED PLANTERS.—Chas. W. Billings, of South Deerfield, Mass.: I claim linking or otherwise equivalently attaching the pulverizing gauges to the draught bar, in such a manner that the gauges are raised or lowered to regulate the depth of furrow to be cut, by elevating or depressing the draught bar to its proper pitch or height for the draught at a given depth of furrow, and whereby the draught bar and gauges are simultaneously raised or lowered, as set forth.

I also claim the combinations and arrangement of the vibrating seed segment slides geared together by cogs or teeth on their peripheries and operating in unison, as set forth.

I also claim the manner of pivoting or jointing the vibrating segments at their centers of motion, by constructing the jointing pin with projecting ears or lips, and forming the joint hole of a key-hole shape, as described.

I further claim, in combination with seed distributing slides, the employment of double-acting spring clearing slides, arranged so as to be capable of lateral movement in either direction, and made self-adjusting to their original position, as specified.

SEED PLANTERS.—Welcome Sprague, of Ellcottsville, N. Y.: I claim the combination of the hollow hub or grain reservoir with the tubes, piston, and rods, operated by the cam grooves, or its equivalent on the diaphragm, the whole arranged as set forth, for the purpose of insuring the deposit of the seed in the soil.

SEED PLANTERS.—J. G. Macfarlane, of Perry County, Pa.: I claim the combination of the action of the levers, cams, spring, and the weight of the scraper, to clean the wheel.

GRAIN HARVESTERS.—Daniel S. Middlekauff, of Hagerstown, Md.: first, I claim the rotary knives or cutters, the edges of which pass by

each other for the purpose of forming a continuous edge for the purpose of cutting the grain.

Second: I claim the reels and the spring ketch and projection on the wheel in combination with the apron, for the purpose of supporting the grain in an inclined position as described.

Miscellaneous.

BUYERS AND SELLERS.

OUR country friends are perhaps little aware of the methods practised in this city, to learn the circumstances of traders in other cities and towns. We will not explain the minutiae of the system, but as a matter of interest give a brief outline. There are several large establishments employing a large number of clerks, whose whole business it is to learn the exact means and business-standing of every merchant or trader in the United States. There is a secret resident agent of these establishments in every town of any importance in the country, who keeps them continually advised as to the financial operations of every trading man in their vicinity. These reports which are recorded in convenient books for reference, relate to the real estate, amount of debts, business character, wealth of relatives, &c., of the trader. Any doubtful turn in his business is at once telegraphed to this city, and is perhaps known here before it has got to a third neighbor. We will give an example to illustrate how this system operates.

Last week a merchant, Mr. G—, from the village of M—, Illinois, called into one of our wholesale stores, and wished to purchase \$600 of goods on a credit of six months. As soon as his name and location were learned, a messenger was privately sent to the *Mercantile Agency* to make inquiries, and in the meantime a clerk was busy showing the general assortment of goods. In twenty minutes the messenger returned to the counting-room with the following record:

"Town of M—, Ill., Jan. 1st, 1854. Mr. G— has been doing a showy business, said to have made some money—will probably succeed in business, though somewhat doubtful. Has recently married a fashionable wife, and they are supporting a style beyond their means. Were it not for this, he might be put down as tolerably fair."

The wholesale merchant after reading this, gives a knowing look to his clerk, and the prices of goods take a sudden rise. If Mr. G. buys in that store, he will pay at least 10 per cent. higher than his neighbor who has a good credit at home. The wholesale dealers must charge more to such characters to make up for risk. The moral of this is, that the farmers may expect to buy goods cheapest of those merchants who have a good capital, and whose families do not by extravagance destroy their credit, at home as well as abroad. In the case alluded to, it is useless for Mr. G. to try to buy cheaper at other stores in the city, for every other dealer has access to the same means of learning his character, and they will be pretty sure to know him thoroughly before they trust him upon any of his own representations. We make these statements in part to introduce the following extract from the *Tribune* of 20th inst., under the heading of "Buyers and Sellers." It is as follows:

We have seldom seen, so early in the season, so large a number of merchants from abroad as now fill the hotels, and go darting about from

store to store, now describing the curve of Wall-st., now threading Maiden-lane, then working their way through Courtlandt-st., and then making an offing in Broadway.

They have already arrived from almost every place that is a place, this side of sunset. Men from Chicago since breakfast yesterday morning; men who sat quietly in their stores in the far capital of Wisconsin, a day or two ago; men fresh from the laughing waters of Minnehaha, whose watch-word is, "Now by St. Paul the work goes bravely on!" Here they are, by railway, and steamer, and stage. Proprietors grow courtly and shrewd. One man they grasp cordially by the hand, ask affectionately after his wife and the bairns he left behind him, offer him a cigar warranted genuine, shake out for him the morning paper, and make him feel more at home than if he were at home. Another they regard with a cool polite expression of inquiry. They really beg pardon; they don't quite recollect him; countenance familiar, and all that, and all the while they know him better than they do their own grandfathers. The first comer is a good customer; he pays cash; he *always* pays. The other is a little, just a *very* little doubtful, and the secret of is out in a twinkling.

The regiments of clerks take their cue with amazing aptness from the file-dealers. They have the grave politeness for the doubtful, the early spring smile for the fair, and the real, warm, genial welcome for the "A No. 1," while to the decidedly impracticable, they are absolutely *breathless* with excuses, and give him, in declining, a better opinion of himself than he ever had in his life.

Selling goods is an art, but accosting men is a *science*; and nobody understands it better than the New-York merchant. And yet shrewd as he is, keen as his eye is to the main chance, it is doubtless due to the natural generosity of his heart that he more frequently errs on the side of "a generous confidence" than the opposite. And what a stupendous system of commercial enterprise does the dealings of the wholesale merchant reveal! Here he is, in some dark narrow street, with his front of twenty-five or thirty feet, his cellars beneath and his lofts above. There he sits behind a little railing at his desk. His alphabet of ledgers are duly marshaled before him. His customers do not live over the way, nor round the corner; they do not come in a one-horse wagon, bringing a grist and the children; they dwell any where within two thousand miles; they speak all languages in the Babel-cleft world; the lengthened train comes thundering down to the Atlantic sea-board, not with one customer, but a hundred; they live every where between the sea and the big river; they crossed that on the ice or by the ferries; they heard the tramp of the buffalo a month ago; they parted in their canoes the rice swamps of the Lake Superior regions; they rode over a prairie groved into the blue heaven.

And here they all are in the counting-house of the New-York merchant. They are his customers; their names have a place in his books; he knows more about them than he does about his immediate neighbors; his eyes and his mind are *telescopic*; he sees things a great way off; he buys on one side of the world and finds his purchasers on the other; he examines silks and teas in the Celestial Empire; handles laces in India; tests coffee in "Araby the blest;" and is here in New-York all the while. He eats, drinks, and sleeps, as other men do, where he is himself; but he sees, thinks, operates around the belted globe. They may rib Broadway with a railroad track; they may start a new line of omnibuses from his very door—but he does not see it; but let a new steamer navigate a river in South America, a new railway be constructed in Iowa, and he regards it with interest. It may let somebody out from some where that will turn into a customer; it may bring him something to buy, or carry away for him something to sell.

Such is a rough sketch, done in chalk, of the New-York Merchant.

BONE FELON.

A SUBSCRIBER of Catskill, N Y., writes as follows:

Seeing in two January numbers of your valuable *Agriculturist* remedies for bone felon, and strictures upon the same, I will give you my remedy, which is as follows: Take equal parts of soft-soap and lime, (not quicksilver,) and apply it in a thimble to a felon and it will cure it, and no mistake. Soak the part affected—to soften—and then take unslacked lime, pounded fine, and soft-soap put into a top thimble, and place it directly over the seat of pain, and in from two to four hours it will eat a hole to the bone and take the matter (or pus) out—then put on any common salve, to prevent taking cold in it, and to heal (?) the slight wound, and the next day you are well. The pain while under the operation of the soap and lime, is not severe.

I have applied this successfully to my own fingers at three different times, and I know of many other cases. One severe one was cured in twenty-four hours.

We doubt not the above would in most cases destroy the felon, but the medicine would be almost as bad as the cure. We think any common poultice to soften the flesh being first applied for a few hours, and then an opening made down to the bone with a lancet or sharp knife, is the safest and simplest method, as the small opening thus made, will soon heal up.

COTTON IN ALGERIA.

PROFESSOR MICHEL CHEVALIER occupies four and a half columns of the *Journal des Debats*, with a very sensible and instructive essay on the question of the culture of cotton in Algeria, respecting which so much has been written within the two months past, for the *Moniteur* and the other ministerial organs. M. Chevalier recites the various bounties and other encouragements of the culture, granted zealously by the government. The Emperor set the example, in appropriating from his civil list the sum of a hundred thousand francs, to be distributed in premiums to the colonists who should be most successful in raising cotton. M. Chevalier is of opinion that the growth of wheat and other cereals, can be but a secondary object; the Arabs alone will be able to send a certain quantity to market. Nor can cattle and sheep be furnished by the European colonists. The olive tree might be exceedingly productive; unhappily, the terrible war has devastated, if not utterly destroyed, the greater part of the orchards. The mulberry flourishes, and fine specimens of silk are displayed; but adequate production is an affair of a long tract of time. Cochineal certainly succeeds; in this, too, time—a long time—is required. The tobacco plant has given satisfactory results; the quality, however, is not suited for cigars. The tobacco culture is already organized on a large scale. The Regie purchases a considerable quantity. Many annual millions of pounds are calculated on; American competition, indeed, is not to be easily overcome. Cotton is among the latest of the colonial undertakings; many good judges pronounce that it is destined to be the chief, the amplest product. All varieties thrive; the Georgia long-staple is the most difficult, from the peculiar soil which it exacts. The professor commends the particular attention which the government has resolved to pay to the culture. There may be interruptions, diminution—from various causes, of the supplies from America. France should aim at independence by domestic progress, that can be as rapid as it has been elsewhere. The growth in Algeria, is entirely free for all settlers. M. Chevalier observes: "If the government could prevail on some American planters to settle in the Mitidja, it would be much more efficacious than any system of bounties and premi-

ums. Honorable men of the enterprising race of the United States might be induced, moreover, to bring with them select bodies of laborers. Grants of land and other favors should be tendered."—*Journal of Commerce*.

SYDENHAM CRYSTAL PALACE GARDEN.

THIS garden, without being one of the largest, will be one of the most beautiful in the world. It is situated on the side and crest of a hill, rising about 200 feet above the adjacent valley, with a terrace 1,700 feet long and 50 feet wide, mounted by three gigantic flights of granite steps, skirting the palace of glass, and appearing to be the base of that magnificent structure. This terrace garden, below the terrace itself, will be richly ornamented with parterres of flowers and statuary, and will be bounded by a noble balustrade, with numerous recesses breaking the long line of wall that supports the terrace. From this garden three other flights of gigantic steps conduct the visitor to a lower level, on the outskirts of which what may be termed the picturesque part of the garden commences. This second level is in the form of a half eclipse, richly decorated with flower beds, on the borders of graceful walks which wind through it in various directions, but converge at three basins 300 feet apart, the central one, which intercepts the long main walk, being 200 feet in diameter, and the laterals, which are nearer the palace, 100 feet each. The center basin is surrounded by a walk 50 feet wide, enclosed by a parapet wall and balustrades, with numerous recesses occupied by groups of statuary. Like all the other basins, it is to be alive with fountains and jets.

Round the central basin, on the grass, below the wall which bounds it, are to be again dispersed beds of flowers, forming a brilliant frame to the turf slope on which the main walk and its adjuncts are elevated. The length of this half eclipse is about 2000 feet, and its depth rather more than 600 feet. It is shut in on its curved side by a low broken ridge covered by ornamental trees. In this part of the grounds all the skill of the landscape gardener had been exerted to combine insensibly the most artificial and elaborately-ornamented ground which it is possible to conceive, with the picturesque irregularities of a park, and the rough inequalities of mere woodland scenery.

Among dells and hollows, gradual elevations sprinkled with trees, and thickets in which deer might hide, fragments of forest ground, and irregular sheets of water, are united, in the most felicitous manner, hard geometrical outlines, ornamental basins, gushing fountains, sparkling jets, sculpture, statuary, and all that belongs to the most formal architectural design. Among the decorations of the grounds will be two water-temple, formed of glass and iron, each 70 feet high, planted with creeping plants, and sending forth perpetual cascades, which, in their descent from two magnificent waterfalls, act in their turn, as feeders to a beautiful lake 1000 feet long, and 400 feet broad, dotted with miniature islands, and screened from the north by a steep, rough, closely wooded bank. On the shores and islands of this lake are to be dispersed models of the extinct and singular monsters of the wealden and neighboring periods.

Huge Chelonians are to bask upon the banks; the Plesiosaur, with its reptile form and bird-like neck, is to repose in the mud; the Megalosaur, the most gigantic of lizards, is to rear its portentous form among the rushes, and the enormous Iguanodon, half elephant half crocodile, measuring 100 feet from his snout to his tail, is to exhibit himself as the true prototype of the dragons of antiquity. The whole of this gorgeous spectacle will be visible from the galleries of the palace, or from a vast verandah, decorated with the choicest climbing plants which will extend for a thousand feet along the south face of the building. So that be the weather what it may, the beauties of the garden can always be witnessed in comfort. The water-works within

the grounds will be three times more extensive than those at Versailles, hitherto the largest, of an ornamental kind, in Europe.

A FAMOUS MILK TREE.—In a narrative of travels on the Amazon and Rio Negro, just published, Mr. Wallace describes an extraordinary tree, called the milk-tree, which was one of the first wonders he saw near Para. The fruit is eatable, and full of a rich and very juicy pulp. But, strangest of all is the vegetable milk, which oozes in abundance when the bark is cut; it has about the consistence of thick cream, and but for a very slight peculiar taste, could scarcely be distinguished from the genuine product of the cow. Mr. Leavens ordered a man to tap some logs that had lain nearly a month in the yard. He cut several notches in the bark with an axe, and in a minute the rich sap was running out in great quantities. It was collected in a basin, diluted with water, strained, and brought up at tea-time and at breakfast next morning. The peculiar flavor of the milk seemed rather to improve the quality of the tea, and gave it as good a color as rich cream; in coffee, it is equally good. The milk is also used for glue, and it is said to be as durable as that made use of by carpenters.

THE RAT AND THE WEASEL.—My informant states that a farmer in the State of Maine, of his acquaintance, had noticed at different times for the period of two weeks, combats between a large rat and a weasel in his barn, from which encounters the latter invariably came off second best. One day, being at work near his barn, his attention was attracted to the weasel very busily engaged in digging a hole in a dung-heap. He watched the weasel until he had "tunneled" the heap; and made a hole of considerable size at the entrance and about half way through the heap; the rest of the hole was tapered off, so that at the place of egress it was barely sufficient size for the slim little body of the weasel to pass through. When the plotter had finished his hole, he went into the barn and engaged his antagonist ratship. Beaten, of course, again in the encounter, the weasel ran, pursued by the rat, into the hole in the dung-hill, the grain eater little suspicious of the snare laid for him. Like many unfortunate human beings, the poor rat was "stuck," and halted sadly between the two extremes; while his cunning little foe emerged from the small end and whipping round briskly to the larger entrance, "brought up the rear," and that was soon a dead rat. Here now was a regular plan laid—a shrewd design carried out successfully on the part of the weasel for destroying a foe which was too much for him in a fair fight. It showed forethought and contrivance, and these are very strong symptoms of—something more than mere instinct—reason.—*Connecticut Valley Farmer.*

COTTON SEED OIL.—Messrs. Wilbur & Co., have started, at New-Orleans, an establishment for the manufacture of cotton seed oil. It is estimated that the enormous sum of forty thousand dollars is annually lost by the cotton planters, from the waste of the refuse cotton seed. The manufacture of this oil might be made a source of large revenue to the South. It can be applied to many useful purposes. Soap and candles made from it are said to be equal to any in use at present. The oil sells in New-Orleans at one dollar per gallon.

Do our readers generally know the reason why the Fourth of March was chosen as the day of the inauguration of the President of the United States? It was selected because the fourth of March in every year, commencing from the first inauguration, cannot come on a Sunday for at least three hundred years.

It is easier to be wise for others than for ourselves.

SPECIAL NOTICE TO ALL SUBSCRIBERS.

We find that by using such good paper, our volume of 532 pages will be quite large to bind, and especially large for those who wish to stitch their paper together with an index, without being at the expense of binding. To obviate this, we have concluded to be at the expense and trouble of making out an extra index with No. 26, so as to form a complete volume of the first 26 numbers. The index for the next 26 numbers will be given at the end of the year, or with No. 52. This arrangement will make it convenient for all, as the 52 numbers can be stitched or bound in two volumes with an index for each, or in one volume with the double index at the close.

We hope all will preserve their numbers, for there are many single articles each of which will be worth the price of the volume, for future reference. When the paper arrives from the post-office, a good plan is to see that it is properly folded, and then pin or sew it through the middle and cut open the leaves. It is very easy to stitch 26 numbers together. To do this, arrange them in regular order, and with an awl punch several holes about one-fourth of an inch from the back, and through these run a strong thread two or three times with a darning-needle, and the work is done. We have scores of volumes of papers, pamphlets, and addresses, thus prepared, which serve all the purposes of a bound volume, and occupy less room in storing and carrying. We would, however, prefer to see volumes of agricultural papers neatly bound and laid upon the book-shelves or tables of farmers. They are much better and more appropriate ornaments, than gilded volumes of trashy magazines or novels.

ONE WORD MORE.—We thank our friends for the liberal aid they have afforded us in extending the circulation of the *Agriculturist*. Our list has increased beyond our expectation, and we are daily encouraged to labor with the utmost diligence, to make our paper worthy of the confidence and admiration of our largely increasing list of readers. Our reliance for the continuance and increase of our list is upon those who are already readers. As stated above, we now divide the year so as to give either one or two complete volumes of the 52 numbers. This number begins the second volume or half of the year. We respectfully request all our present subscribers to make a little exertion at this time, and each send us on at least one new name. If you cannot get your neighbors to send on for a year, ask them to try the paper for six months, as in that time they will get a complete volume of 416 pages with index for \$1, or less if clubs are formed. Where clubs already exist new names may be added at the same rate, and these names may be at different post-offices. See the last page for terms, special notices to subscribers, &c.

TO CORRESPONDENTS.—We have several communications on hand which we will look over as soon as we have time, and some of them will be published. It is no trifling labor to prepare for the printer many communications which we receive. Some are written so closely that there is not room to put in corrections, without re-writing the whole. We cheerfully prepare articles, unless there is manifest want of care on the part of the writer. If he does as well as he can, we make all needful changes and corrections.

As most writers doubtless wish to improve their own style, we suggest to them to keep an exact copy of their communications, and then compare this copy with the printed sheet. They may often learn something in this way.

We are not anxious to receive original poetry. We have little space for rhyme, and we have good selections enough to last us a year at least. Good poetry, however, will not be rejected; but we advise all who attempt to write in verse to remember, that good rhyme does not constitute good poetry; on the contrary, some of the best

poetry we have ever seen does not "rhyme" at all, while some of the best rhyme contains not a single poetic sentiment.

Markets.

REMARKS.—Flour has advanced 25 cents per bbl. the past week, and Wheat to correspond. Corn has improved 4 to 5 cts. per bushel. Pork, a decline of 12½ to 25 cts. per bbl. Lard also a slight decline, Beef firm.

Cotton, ½ to ¼ of a cent per lb. lower. Rice, Sugar, and Tobacco about the same as per our last.

Money continues in urgent demand by outsiders at 10 to 15 per cent. This long continued high rate of interest is in consequence of over importation, and unprofitable land, and real estate speculations. If these could cease for awhile interest would come down. Stocks are lower.

The weather has been very cold and unpropitious the past eleven days. We do not recollect so cold a season. The thermometer has sunk every night within 18 to 26 degrees of zero, which is most extraordinary.

From the Mark Lane Express, March 6th.

REVIEW OF THE BRITISH CORN TRADE.

THE upward movement in prices noticed in our last has not been sustained, and the Wheat trade has for some days past exhibited signs of weakness though nothing has occurred of a character calculated to alter the position of affairs. We are therefore inclined to attribute the slight reaction which has taken place to the unwillingness which is naturally felt by millers and bakers to hold stocks of any consequence, at the high prices now current; indeed, with many of the less wealthy this is not a matter of choice, as the money required to carry on even a moderate business, with Wheat at 80s. to 90s. per qr., is not so easily managed as when prices are lower. The same cause operates against speculative investments; and though this occasions a certain amount of dullness, it has this advantage—that it keeps the trade sound and healthy. That which is bought one week is, in the majority of cases, passing into consumption the week following; and whilst buyers exercise so much caution, they can scarcely suffer any loss of importance by a decline of a few shillings in the value of the article.

The weather continues very favorable for the sowing of Lent Corn, which is making rapid progress, and promises to be completed in a highly satisfactory manner; it may be questioned, however, whether the great fluctuations which have taken place this week in the temperature can be considered altogether favorable for the young wheat plant. The nights and mornings have been exceedingly cold, the thermometer having sunk below freezing point nightly; whilst at mid-day the sun has had great power.

PRODUCE MARKETS.

Wholesale prices of the more important Vegetables, Fruits, &c., at the principle New-York Markets.

March 25, 1854.

VEGETABLES.—Potatoes, Junes, ½ bbl., \$2 62½; Carters, \$3 50; Meers, \$3 25; \$3 87½; Merinos, \$2 12½; \$2 37½; Western Reds, \$2 37½; \$2 50; Pinkeyes, \$2 27½; \$2 50; Parsneps, ½ bbl., \$1 50; Beets, ½ bbl., \$1 50; Carrots, ½ bbl., \$1 50; Onions red, ½ bbl., \$1 50; yellow, \$2; white, \$3; Vegetable Oysters, ½ doz., \$1; Spinach ½ bbl., \$2 50; Turnips, ½ bbl., yellow, \$1 75; white, \$1 50; Celery, ½ doz. bunches, 75c. @ \$1 50; Cabbage, ½ hundred, \$5 @ \$10; Lettuce, ½ doz., 50c. @ \$1.

FRUITS.—Apples, Greenings, ½ bbl., \$3 50; Spitzenburgs, ½ bbl., \$3 50; Russets, ½ bbl., \$3 50; these are of the first quality. Second quality of the kinds above mentioned are worth from \$2 @ \$2 50; Northern Spy, ½ bbl., \$4, and but very few in market; Cranberries, ½ bbl., \$9 @ \$10, and very scarce; Maple Sugar, per lb. 12½c.

The markets are rather dull. Large quantities of vegetables are brought in by the Hudson River Boats. The season for most of the fruits is about over, with the exception of some of the later keeping kinds.

NEW-YORK CATTLE MARKET.

Monday, March 27, 1854.

THERE is quite a falling off of numbers in market to-day, and we saw no specimens worthy of especial notice. The largest number was from Ohio. Notwithstanding the inferiority of the cattle compared with those presented for some weeks previous, the prices are from $\frac{1}{2}$ to $\frac{3}{4}$ of a cent per lb. higher than last week.

Lowest price, $8\frac{1}{2}$ c.; Middling beef, $9\frac{1}{2}$ c.; Best, $10\frac{1}{2}$ c.

Washington Yards, Forty-fourth street.

A. M. ALBERTON, Proprietor.

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY.
Beeves, 1,759	1,542
Cows, 26	
Sheep, 762	150
Swine, 526	
Veals, 605	

Of these there were forwarded by the Harlem Railroad, beeves, 53; cows, 26; sheep, 278.

By the Hudson River railroad, beeves, 500; swine, 161.

Erie railroad, beeves, 700; sheep, 481; swine, 365.

New-York State, furnished by cars, 366.

Ohio, by cars, 767.

Kentucky, by cars, 157.

Pennsylvania, on foot, 199.

Mr. ALBERTON reports the following prices: Swine, corn fed, $5\frac{1}{2}$ to $5\frac{3}{4}$ c. per pound; Sheep, $\$4$ to $\$7$ per head. By the pound, live weight, gross 6c.; dead, 11c.; Cows, $\$30$ to $\$50$, according to quality.

CHAMBERLIN'S, Robinson street.

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY.
Beeves, 200	
Cows and Calves, 40	12
Sheep, 2,500	225
Veals, 25	
Swine, 400	

O'BRIEN'S, Sixth street.

Beeves, 105	
Cows, 127	

BROWNING'S, Sixth street.

Beeves, 348	
Cows, 85	
Sheep, 1,730	120

Mr. CHAMBERLIN reports the following prices at Robinson Street: Cattle 8, 9 to 10c. per pound; Cows and Calves, $\$25$ to $\$30$ to $\$40$; Sheep, $\$4$ to $\$5$; Extra, $\$7$; Veals, $5\frac{1}{2}$ to $7\frac{1}{2}$ c. per pound; Swine, 4 to 5c.; Pork in the carcass at Washington Market is worth 6 $\frac{1}{2}$; Mutton, 8 $\frac{1}{2}$; Beef, 8c. per pound.

SALE OF STOCK.

PURE BRED STOCK AT PRIVATE SALE AT MOUNT

Fordham, Westchester Co., New-York, Eleven Miles from City Hall, N. Y., by Harlem Railroad Cars.

Having met with more success than I anticipated the past year, with the Catalogue of male animals at Private sale, is the reason for offering this lot of animals. **AND MY JUNE SALE BY AUCTION, WILL NOT TAKE PLACE.** A full descriptive Catalogue with prices attached, will be published on the fifteenth of April, and I intend to be at home myself to see any who may call. I will sell at private sale, about 18 Short-Horns, 6 of which are young Bulls and Bull Calves. The Cows and Heifers old enough, will be in calf, to the Celebrated Imported Bull BALCO, (2918) or Imported, "ROMEO," winner of the first Prize at Saratoga, in 1853; and also at American Institute the same year.

The young Bulls and Bull Calves, are some of them from imported Cows, and sired in England; and others are sired by the imported Marquis of Carrabas, (11789) winner of the first Prize at Saratoga, the past year, as a two year old.

Also, about 10 head of Devons, consisting of a yearling Bull, sired by MAJOR, and 5 Bull Calves, sired by my imported first Prize Bull, FRANK QUARTLY, and several of them from imported Cows and Heifers old enough, will be in calf to FRANK QUARTLY. Also 6 or 8 Suffolk Sows; and several young Suffolk and Essex Boars. Also, 2 South-down Rams, imported direct from Jonas Webb; and 6 Yearling Rams, all bred by me, from Stock on both sides, imported from Jonas Webb. Catalogues will be forwarded by Mail if desired.

All Animals delivered on SHIPBOARD, or RAIL CAR in the City of New-York, free of expense to the purchaser.

The Devons are at my Herdsdale Farm, 13 miles north, to which place I will take persons both to and from.

MY FRIEND MR. N. J. BECAR, who is interested in several of my Importations, will also sell about 10 head of Short-Horns, consisting of 4 young Bulls, and 5 or 6 Females. His young Bulls are also several of them from imported Cows, and sired by the LORD OF ERYTHOLME, (12365), and the celebrated first Prize Imported Bull ROMEO. Mr. Becar's Cows and Heifers are in calf to the imported Bull, MARQUIS OF CARRABAS, (12789). Mr. Becar can be seen at his Store, No. 187 Broadway, New-York, at which place he will make arrangements to go to his Farm, at Smithtown, Long Island. His animals will be entered in the same Catalogue with mine, which can be obtained by addressing him at his Store, or me at Mount Fordham. His animals will be delivered in the same manner as mine. Our Importations have been in almost all cases made at the same time, and are of equal merit, excepting that I have more in number.

L. G. MORRIS.

TERMS, Cash on delivery. March 16th, 1854. 29-37

ISABELLA GRAPE VINES.

OF PROPER AGE FOR FORMING VINEYARDS, CULTIVATED from, and containing all the good qualities which the most improved cultivation for over fourteen years has conferred on the Croton Point Vineyards, are offered to the public.

Those who may purchase them will receive such instructions for four years, as will enable them to cultivate the grape with entire success, provided their locality is not too far north. All communications addressed to R. T. UNDERHILL, M. D., New-York, or Croton Point, Westchester Co., N. Y., will receive attention. The additional experience of two past seasons, give him full assurance that by improved cultivation, pruning, &c., a crop of good fruit can be obtained every year, in most of the northern, and all the middle, western, and southern States.

N. B. To those who take sufficient to plant four acres, as he directs, he will, when they commence bearing, furnish the owner with one of his vinedressers whom he has instructed in his own mode of cultivation; and he will do all the labor of the vineyard, and insure the most perfect success. The only charge a reasonable compensation for the labor.

28-31. R. T. U.

GENUINE SUPER-PHOSPHATE OF LIME.

THE SUBSCRIBER HAS NOW ON HAND, AND IS CONSTANTLY MANUFACTURING at his works in MIDDLETOWN, CONN., SUPER-PHOSPHATE OF LIME, which he warrants free from any adulteration, and equal if not superior to any in the market. It is made of bones, prepared in the most approved manner, put up in substantial bags for transportation, and is furnished promptly to order, or at the works.

He also manufactures and has constantly on hand for the market, BOXES OF a superior quality.

These fertilizers have been thoroughly tested by careful and experienced agriculturists in this vicinity, and have given general satisfaction.

March 13, 1854. [28-40.] Middletown, Ct.

DIRECTIONS FOR THE USE OF GUANO.—A full and minute description of the different crops and soils to which Peruvian Guano is adapted, with full directions for its application, a pamphlet for 96 pages, and can be sent through the mail. Price 25 cents.

CHARTER OAK GRAPES.

NOTICE.—THE UNDERSIGNED WISHES TO DIRECT particular attention to these magnificent grapes, which he has propagated with such success, that they are beyond comparison the largest grapes known. He has many one- and a half inches in diameter. The grape is perfectly hard, and will endure the winter, and ripen 2 or 3 weeks sooner than the Isabella or Catawba. The Charter Oak Grape is unsurpassed for preserving and for wine—and a delicious table fruit. Orders up to 1st May received by subscriber, at 5 Scamwell street, New-York city. After that date at Frankfort, N.Y. [27-31] JOHN P. WILSON.

MORRIS FEMALE INSTITUTE.

THIS INSTITUTION IS SITUATED AT MORRISTOWN, N. J., about an hour and a half's ride from the city of New-York, on the Morris and Essex railroad; the cars leaving New-York several times a day. It has been ably patronized for the last six years. There will be a vacancy for a few more pupils in April.

Faithful teachers are provided for English branches usually required: Also Drawing and Painting. French, Latin, and Spanish under a native teacher.

Vocal and instrumental music by an accomplished player, whose time and attention has been for years devoted exclusively to this object.

Further particulars, and circulars, may be obtained by applying to J. A. SEELEY, Principal, or at the book-store of Messrs. C. Shepard & Co., 152 Fulton street, near Broadway, or at this office.

Persons wishing to send their daughters from home, would do well to visit this Institution before deciding. 27-41

Orders from any distance promptly attended to. Address, post paid WM. DAY, 26-41 Morristown, Morris Co., N. J.

ASSISTANT EDITOR WANTED.

THE PUBLISHERS OF A STANDARD AGRICULTURAL Journal wish to secure the services of a young man who has had experience on the farm and in the garden, and who is capable of assisting in the office duties of a paper, such as writing and preparing articles, correcting proof, answering correspondence, &c. To such a man there is a fine field open, both for self-improvement and for rising in the editorial profession. The place is a good one for a young man who has just completed a collegiate course, provided he has had sufficient farm experience to qualify him for an accurate observer and writer on agricultural subjects. Salary first year moderate. For further information address ALEXANDER, to the care of the editors of the American Agriculturist, New-York, stating age and experience, and sending articles of composition if he has written any for the press. Communications on this subject will be considered strictly confidential. 26-27

NO. 1 SUPERPHOSPHATE OF LIME.—THIS VALUABLE fertilizer has been used for several years in England and other parts of Europe, and, next to Guano, holds the highest rank in popularity, and the extent to which it is used among farmers. Its introduction in this country has been more recent; but the progress it has made in the estimation of the public has not been less marked or successful than abroad. It is now extensively used throughout the Northern States, after a full trial and investigation of its merits; and it is rapidly becoming, like its predecessor, Guano, a favorite manure at the South and West.

It is composed of crushed or ground bones, decomposed by the addition of about one fifth their weight of sulphuric acid, diluted with water, to which is added a due proportion of guano and sulphate of ammonia. The latter is the active and one of the most efficient agents in the best Peruvian Guano.

It is suited to any soil in which there is not already a full supply of the phosphates, which is seldom the case. All crops are benefited by its application.

For sale in large or small quantities, in bags of 50 lbs. each. No charge for packages. All bags will be branded "C. B. De Burgh, No. 1 Superphosphate of Lime."

PERUVIAN GUANO of best quality.

AGRICULTURAL AND HORTICULTURAL IMPLEMENTS of all kinds.

FIELD AND GARDEN SEEDS, of various sorts, fresh home grown and imported.

THE AMERICAN AGRICULTURIST—weekly, \$1 per volume—two volumes a year.

For sale at R. L. ALLEN'S Agricultural Warehouse and Seed Store, 189 and 191 Water street, New-York. 25-1

FOR SALE AT THE SOUTH NORWALK NURSERY, THE Great New Rochelle or Lawton Blackberry Plants; also plants of the White fruited Blackberry. For sale also a large stock of small plants of the new or North River Red Antwerp plants, at the low price of fifteen dollars per thousand. The above plants all warranted.

GEO. SEYMOUR & CO., South Norwalk Nursery, Conn. 24-36

ATKINS' SELF-RAKING REAPER.—40 of these machines were used last harvest in grass or grain or both, with almost uniformly good success, in nine different States and Canada. TWENTY-SIX PREMIUMS, including two at the Crystal Palace, (silver and bronze medals,) were awarded it at the autumn exhibitions. I am building only 200, which are being rapidly ordered. Mr. Joseph Hall, Rochester, N. Y., will also build a few. Early orders necessary to insure a reaper.

Price at Chicago \$175—\$75 Cash with order, note for \$50, payable when reaper works successfully, and another for \$50, payable 1st December next with interest. Or \$160 cash in advance. Warranted to be a good Self-Raking Reaper.

Agents properly recommended, wanted throughout the country. Experienced agents preferred. It is important this year to have the machines widely scattered.

Descriptive circulars with cuts, and giving impartially the difficulties as well as successes of the reaper, mailed to post-paid applications. J. S. WRIGHT.

"Prairie Farmer" Warehouses, Chicago, Feb., 1854. 23-35

POUDRETTE.

THE LODI MANUFACTURING COMPANY OFFER their Poudrette for sale in lots to suit purchasers, from a single barrel up to 4000 barrels, at their usual rates, \$1 50 per barrel for any quantity over seven barrels, delivered on board of vessel in the city of N. York, free of cartage or other charge. When 200 or 300 barrels are taken, a deduction will be made from the above price. That this article has stood the test of fourteen years trial is proof of its efficacy. It is the cheapest and best manure for corn ever produced, and it has the advantage of being useful in small quantities and harmless in large. It is a capital manure for peas, strawberries, &c., and all garden vegetables. Apply by letter or personally to the Lodi Manufacturing Company.

22-34 74 Cortlandt st., New-York.

GARDENER FOR THE GREEN-HOUSE AND GRAPE-HOUSE.—Wanted a Gardener as above, who is experienced in the management of the Green and Grape-House in the United States. None need apply except fully qualified. A. B. ALLEN, 189 Water st. 22-1

SEEDS FROM THE CRYSTAL PALACE.—A few choice samples of Two rowed Barley, Four rowed Barley, White Poland Oats, Black Prince Edward's Island Oats, Spring Wheat, Timothy, and Flax Seed, for sale by R. L. ALLEN, 189 and 191 Water st. 22-1

EARLY EXCELSIOR POTATOES.—THIS IS A NEW AND every superior sort. They are as early as the June potatoes, grow above the average size, are mealy and palatable, and have kept better than any other variety planted in this vicinity. The rot has never been known among them. R. L. ALLEN, 189 & 191 Water st., N. Y. 26-1

DIRECTIONS FOR THE USE OF GUANO.—A full and minute description of the different crops and soils to which Peruvian Guano is adapted, with full directions for its application, a pamphlet of 96 pages, and can be sent through the mail. [211] R. L. ALLEN, 187 and 191 Water st. 21-1

SHEPHERD DOGS.—WANTED ONE OF THE ABOVE Dogs of the Scotch Collie breed. He should be under one year old, and partially trained. Name lowest price at once, which must be moderate. A. B. ALLEN, 189 Water st. 21-1

GARDEN IMPLEMENTS.

HEDGE, LONG-HANDLE, AND SLIDING PRUNING SHEARS; Budding and Edging Knives; Pruning Hatchets, saws and knives; pruning, vine and flower scissors; bill and Milton hooks; lawn and garden rakes; garden scufflers, hoes of great variety, shovels and spades; hand engines, which throw water forty feet or more, syringes and water pots; grafting chisels, tree scrapers, and caterpillar brushes; transplanting trowels, reels; hand plow and cultivator, very useful to work between rows of vegetables, together with a large assortment of other implements too numerous to mention. [211] R. L. ALLEN, 187 and 191 Water st. 21-1

MEN AND BOYS' CLOTHING, AT WHOLESALE AND RETAIL.—cheaper than ever, at J. VANDERBILT'S, No. 81 Fulton street, New-York. A very large assortment of all qualities and sizes; also a splendid assortment of fashionable goods, which will be made to order in a style that cannot be surpassed. Also India rubber clothing and furnishing goods. Your patronage is respectfully solicited. J. VANDERBILT, 81 Fulton street, 2-30

GRAIN MILLS, STEEL AND CAST IRON MILLS, AT \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES.—FOR MAKING DRAINING TILES OF all descriptions and sizes.

WATER RAMS, SUCTION, FORCE, AND ENDLESS-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL KINDS, MADE EXPRESSLY for the California and Oregon Markets.

DRAINING TILES OF ALL FORMS AND SIZES.

CLOVER AND TIMOTHY SEED HARVESTER.—A newly patented machine, will harvest 10 or 12 acres per day with one horse.

HAY AND COTTON PRESSES.—BULLOCK'S PROGRESSIVE Power Presses, combining improvements which make them by far the best in use.

THRESHERS AND FANNING-MILLS COMBINED.—OF Three Sizes and Prices, requiring from two to eight horses to drive them, with corresponding horse powers. These are the latest improved patterns in the United States.

SOUTHERN PLOWS.—Nos. 10 1/4, 11 1/4, 12 1/2, 14, 15, 18, 18 1/2, 19, 19 1/2, 20, A 1, A 2, 50, 60, and all other sizes.

CORN-SHELLERS, HAY, STRAW, AND STALK-CUTTERS, Fanning-Mills, &c., of all sizes.

AGRICULTURAL IMPLEMENTS.—THE SUBSCRIBER keeps constantly on hand, and offers for sale the following valuable implements:

Fan Mills of various kinds, for rice as well as wheat, rye, &c. Grain Drills, a machine which every large grain planter should possess. They are of the best patterns, embracing most valuable improvements.

Snout Machines, Pilkington's, the most approved for general use.

Hay and Cotton Presses—Bullock's progressive power-presses, combining improvements which make them by far the best in use.

Grain mills, corn and cob crushers, a very large assortment of the best and latest improved kinds.

Horse Powers of all kinds, guaranteed the best in the United States. These embrace—1st. The Chain Power, of my own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, and economy. They are universally approved wherever they have been tried. 2d. The Bogardus power, for one to four horses. These are compact, and wholly of iron, and adapted to all kinds of work. 3d. Eddy's Circular Wrought Iron Power, large cog-wheels, one to six horses, a new and favorite power. 4th. Trimble's Iron-Sweep Power, for one to four horses. 5th. Warren's Iron-Sweep Power, for one or two horses. R. L. ALLEN, 189 and 191 Water street. 1-11

REED & HOYT, PREMIUM PATENT RIVETED STRETCH-ed Leather Band Manufacturers, 37 Spruce street, New York. 3-29

FERTILIZERS.

HAIR RESTORERS, &c.

BARKER'S CHEVEUXTONIQUE.—THIS IS AN ENTIRELY new article, concocted for the purpose of Preserving, Restoring, and Beautifying the Hair, and, unlike most preparations designed for the same objects, it is free from all grease, so that its application cannot soil the most delicate fabric. As an eradicator of dandruff it is unequalled, while its infallibility in cases of headache, easing the most violent in a few moments, cannot fail to commend it to universal appreciation. The Cheveux-tonique is for sale by all the respectable druggists and fancy stores throughout the city. The depot for its sale, wholesale and retail, is at BARKER'S Ladies' Hair-dressing Establishment, No. 439 Broadway. 2-48

HORTICULTURAL.

FRUIT AND ORNAMENTAL TREES AND PLANTS.—Including everything necessary to the Garden, Greenhouse, Nursery, and Orchard, with all the recent introductions, at very low rates. Descriptive price Catalogues gratis. Carriage paid to New-York. Ornamental and other planting done in any part of the country. The best season for transplanting is after Oct. 10. Address B. M. WATSON, Old Colony Nurseries, Plymouth, Mass. 8-59

WACHUSETT GARDEN AND NURSERIES,

NEW-BEDFORD, MASS., ANTHONY & MCAFEE, PROPRIETORS Successors to Henry H. Crapo, would invite the attention of the public to their extensive stock of Fruit and Ornamental Trees, Flowering Shrubs, Rose Bushes, &c., Evergreens, Balsam Fir, American and Chinese Arbor Vitae, Cedrus Decidua, Cryptomeria Japonica, Norway Spruce, Yew Trees, Tree Box, &c., an extensive assortment of Apple, Pear, Plum, Cherry, Peach and Apricot Trees.

The stock of Pear Trees is very large, both on Pear and Portugal Quince Stocks, embracing every thing worthy of cultivation. All our Pear Trees are propagated and grown by ourselves.

WARRANTED TRUE TO NAME. The soil, climate, &c., of this locality being so favorable to the Pear, our trees are unrivalled for HEALTH, vigor of growth, &c., &c.

They are all free from that destructive malady THE PEAR BLIGHT, which has never existed in this locality.

Prices low, and a liberal discount to the trade. New-Bedford, Jan., 1st, 1854. 17-68

MANUFACTURES.

RANGES AND HEATERS.—I AM NOW PREPARED TO supply those in want of a Cooking Range with one that is not only economical, but combines more conveniences for boiling, baking, &c., than any other in use. Also, the Etna Heater, for warming houses of any size. Apply to A. McPHERSON, No. 233 1/2 Water street. 2-40

FISH HOOKS AND FISHING TACKLE, NEEDLES, &c.—HENRY WILLSHER, Manufacturer and Importer of Needles, Fish-hooks and Fishing-tackle, consisting of Limerick and Kirby salmon, trout, bass, pike, perch and other Hooks; Salmon, Lake, and Trout Flies; Cork and Wood Floats; Flax, Twisted and Hatted Silk, Chinese Grass Hair, and Cable-laid Lines; Bowed, Swivel, Hollow, and Plain Sinkers; Flax and Silk Lines ready for use; Silk-worm Gut; Snells; Double Twist, and Single Gut Leaders; Spoon Bait; Squids; Multiplying and Plain Reels, Nets, Artificial Fish; Walking-cane and other Rods; Lolley's and Chambers' Sail Needles; Pack and Willshe's superior Sharps and Between Needles, &c. Cheap for cash, in lots to suit purchasers, at No. 9 Cedar street, New-York. N. B.—Orders per mail or otherwise promptly attended to. 2-40

MISCELLANEOUS.

GREENWICH POTTERY 261 WEST EIGHTEENTH street. Steam-pressed Vitrified Drain Pipe, from three to eighteen inches in diameter, and in two foot lengths. The best and cheapest medium for drainage and sewerage ever yet offered to the public. The subscriber is the exclusive manufacturer of steam-pressed Drain Pipe in this country, and he offers it to the public on as favorable terms as the ordinary drain pipe made or sold in this city. 2-27

WASHINGTON SMITH, WHOLESALE FISH STORE.—500 BBLs. SALMON, 2000 bbls. Mackerel, first quality, 3000 Small Packages Mackerel, 2000 bbls. New Shad, 500 halfs Shad, 1000 bbls. New Herring, 300 halfs New Herring, 1000 quintals New-Dried Cod-fish, 500 Jars New Anchovies, 500 Kegs New Dutch Herring, 2000 Boxes New Smoked Herring, 3000 lbs. New Smoked Salmon, 500 Kitts New Soused Salmon, 500 Kegs New Spiced Herring, Sword-Fish, Blue-Fish, Pickled Cod, Haddock, Halibut, White-Fish, Sturgeon, Trout, Dun-Fish, &c. R. L. ALLEN, 81 Dey street, between Washington and West, May 13th, 1852. NELSON WELLS. 1-53 S. H. WOOD. New-York.

SEEDS.

SEEDS.—TIMOTHY; RED AND WHITE CLOVER; BLUE Grass; Orchard Grass; Bay Grass; Red Top; Sugar Corn; Peas; Beans; Turnip; Cabbage; Beet; Lettuce; Onions; Radish; Squash; Osage Orange; Large Yellow Locust, and all other kinds of field and garden seeds. Also Rubber Roots; Asparagus Plants, &c. R. L. ALLEN, 189 and 191 Water street. 1-11

STOCK.

IMPROVED STOCK OF ALL KINDS.—HAVING HAD great experience in breeding and rearing fine stock for the past twenty years, I offer my services to my friends to procure it of the best and most reliable kinds. As much notice as convenient is at all times desirable previous to purchasing, as it takes time to make good selections. Early in August or September is the best time to purchase for the South.

Short Horn or Durham cattle, Devons, Herefords, Alderney or Jersey and Ayrshires. Long-wooled Sheep—the Cotswold, Oxford, Leicester, Bakewell, and Lincoln. Mutton Sheep—the Southdown. Fine-wooled Sheep—such as the Saxon, Spanish, and French Merino.

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, which are spurious.

1-11 A. B. ALLEN, Nos. 189 and 191 Water street.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master, and ask him to mark the envelope, *Registered by—P. M.*

BACK NUMBERS are usually kept on hand, and when a subscription is sent without naming any date for commencing, the back numbers from the beginning of the current volume will be sent, unless as sometimes happens, an unusual rush of subscribers has exhausted the supply.

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In writing, always give the Post-office (instead of the town) and the County and State. *Write these very plainly.*

Clubs may add to their number at the same rate per copy as was paid by the original members.

Those wishing their papers changed from one office to another, should give the name, county, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished with Harper's Magazine, one year for.....	\$4 00
Putnam's do.....	4 00

J. A. GRAY, Printer, 95 and 97 Cliff street, N. Y.

PUBLISHERS' ANNOUNCEMENT!

Twelfth Volume of

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the Agriculturist.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of the year for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon its own merits; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammelled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDD, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers, - - -	\$2.00 a year, \$2.00
" Clubs of 3 do. - - -	1.67 " 5.00
" do. 5 do. - - -	1.60 " 8.00
" do. 10 do. - - -	1.50 " 15.00
" do. 20 do. - - -	1.25 " 25.00

The money always to accompany the names for which the paper is ordered.

The Post-Master, or other person sending a club of ten, will be entitled to one extra copy gratis. The Post-Master, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, *Weekly Tribune*, or *Weekly Times*, or any other paper or periodical in this city, not costing to exceed two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if enclosed and mailed in the presence of the Post-Master.

Communications for the paper should be addressed to the Editors; subscriptions, advertisements, and all matters relating to the business department, should be addressed to the Publishers,

ALLEN & CO.,

THE NATIONAL POULTRY SOCIETY.

So much badinage has of late been talked, written, and published in relation to chicken shows, and the poultry trade, and so many criticisms in prose, verse, and caricature, perpetrated at the expense of the unoffending Shanghais, and their Asiatic compeers, it will hardly be taken by our readers that we, in due gravity, commence an article with the imposing sobriquet we have placed at its head. We are, however, and we intend to keep, in sober earnest throughout this discussion while upholding the integrity of the Society and its labors, and in commending to the universal family of mankind, where space and opportunity serve, so laudable an example in raising up and improving one of the choicest gifts which Heaven has vouchsafed to fallen man with which to enrich and comfort himself, as well as to promote a refined and genial taste in the development and improvement of animal life.

"Well, truly," says one intellectual reader, and man of acres, "this is a great business for an agricultural paper of high pretensions, scientific and otherwise, to go into a chicken discussion, as if it were really of any consequence above the attention of serving women and boys away with such nonsense!"

Softly, good friend. Have you never talked politics; dawdled away hours of time in various kinds of nonsense; discussed frivolous subjects time and again, and spent dollars in what you knew would prove a waste, or worse than a waste, of the whole amount invested? Yes you have—own up—confess the truth, and hear us patiently, for we will open your eyes before we have done; and if not a convert, you shall acknowledge that the science of poultry rearing and keeping is worth the study of every one, who has a space of ground sufficient to hold, and time enough on his hands to care for them.

It is within ten years past only that public attention has been awakened to the true value of poultry as an article of domestic stock, or as creatures of sufficient merit and beauty in themselves to render them worth attention beyond the rude call of the clowns of the barn-yard, or the pence-saving economy of the common housewife. In the multiplied objects, however, which increased intelligence and luxury are continually adding to the demands of country life, the resources of the poultry-yard have been drawn into active requisition. The various species, kinds, varieties and tribes of the whole domesticated feathered world have been examined,

their merits canvassed, and their subjects appropriated to the use, pleasure, and amusement of our people, to a degree certainly never equalled since our country had a population. As a matter of taste they have become a branch of the fine arts—"high art," poor Haydon, in his enthusiasm for art-progress, would have called it.

There is as much science, taste, and art in breeding poultry "to a feather," as in breeding a horse to the highest racing or trotting speed, and to our notion, quite as useful to the world at large—and, in their consequences, vastly less productive of the questionable commodity of "fast" men, than the latter pursuit. We have sat at the dinner table where grave and reverend gentlemen sipped their wine and bobbed their heads towards each other with the most potential dignity, and where wine vaults, the years of their vintage, and their manner of keeping, were discussed for hours together, and not a single valuable idea eliminated during the whole sitting; and if, in place of such a bore, the company could have adjourned to a well-bred poultry-yard, and discussed the merits of its several inhabitants, with the taste and intelligence which they deserved, each one would have been the wiser in head, and better in stomach and body for the transition.

Claiming, therefore, that poultry are worth the attention of thinking people, we at once declare in decided favor of the recent formation of the National Poultry Society, and class it among the beneficent institutions of the land.

"But," says our unsatisfied auditor, "why put BARNUM at the head of it, and thus stamp it a humbug of the first water; have the show at his Museum, among the Catamounts, and Kangaroos, and disgust all sensible people with such a beginning?"

"Well, my good sir, let BARNUM be a humbug, if you will have it so. But when BARNUM humbugs the public he has the manliness and honesty to let them know *how* they are humbugged—so they have it as cheap as he gives it. And we would like you to tell us how so cheap, efficient, and convenient a plan could have been got up for the late poultry exhibition as he proposed and carried out at his Museum? It cost the exhibitors next to nothing; saved them much trouble; he paid the premiums all out of his own pocket, without cost to any one; gratified the public; and if he made money by it, it was because he was so situated he could do what no one else could accomplish. Now where's the humbug or wrong about that?"

"I see. You are determined to have the argument all your own way. So I may as well sit quiet and remain a listener."

"Not altogether so, my old friend; but as you have condescended to have a little reason on the

subject, we shall take pains to have a conversation—or if you so consider it—an *argument*, at a future hour; for we have so many calls upon our time at this moment, that with your leave, the subject will be postponed till another day, when, not BARNUM, but poultry, in its merits as a valuable branch of domestic stock, a subject of taste, and a department of the fine arts, will be the order of discussion.

THE INDIAN CORN FIELDS OF THE WEST.

Now that American grain and provisions are bringing a high price in the Atlantic markets for export, it is cheering to contemplate the broad extent of country which we have to produce them.

While in Ohio recently, we selected three ears of corn, a fair average, from a large crib, the product of a field near by. The owner told us that he usually planted his corn 4 feet apart each way, and never wanted more than three stalks in a hill. Thus planted, and the corn well tended, he seldom got less than sixty to eighty bushels per acre, on *good* corn land; on rich bottoms frequently more. Knowing the proneness to overrate these things, we shelled and weighed the kernels on these three ears, and we are certain they were not over the average of the crib, in size. The weight of the corn, on the three ears was 34½ ounces, averdupois. The production of an acre, supposing every hill to produce three stalks, and one ear on each, the hills four feet apart, and 2724 of them on an acre, will be 104 50-56 bushels. We have seen corn grown much thicker than that, and produce well, but as the great western corn is a gross feeder, both in the roots and the stalk, it should never be crowded. One hundred and sixty bushels has been certified as the production of an acre in Indiana—but that is one of many thousand. We have no doubt, however, that sixty bushels, with the casualties and omissions incident to its growth, is a fair crop, on good corn lands in the Ohio and Mississippi vallies, below 41 north latitude, and north of the Gulf of Mexico. This may scarcely be believed by those who have only witnessed the stunted growth of our northern corn; yet where it is all but spontaneous, as at the West, the capacity of that broad region in its production is almost illimitable. It would, properly cultivated, bread the world!

For the American Agriculturist.

KEEPING EGGS.

THE triumphant cut-cut-cur-dar-cut, which so often greets my ear from the poultry-yard, assures me that its inhabitants are busy in imparting their wealth to us who have fed and shel-

tered them through the winter. The nice, fresh eggs for breakfast, are a most acceptable token of gratitude, and we feel no disposition to undervalue them.

But our hens, in their extreme generosity, provide us with more than we need to use at present. How shall we best preserve them for a season of scarcity? Sometimes we have packed them carefully in coarse salt, always placing the small end downwards. They have kept very well through the winter in this way, and perhaps would do so through the summer.

Recently we have adopted another method, which has proved quite satisfactory, and by which we have kept them a year. I received the recipe from a dealer in eggs. To whom he is indebted for it, I cannot say; but, I will, in my turn, give it to the readers of your paper, who may be disposed to use it.

To Preserve Eggs.—Take one pound quick or stone lime and slack it in three gallons of water. Then add one pound of salt. Put the eggs in when the mixture is cold. Look to it frequently to ascertain if the top is encrusted with lime. If not, slack a little more and add to it. A pork or wine barrel is best for the purpose.

It is necessary to be particular that the shell of the egg should not be cracked. If it is, the lime hardens the yolk, and renders it unfit for use.

HARVESTING CORN.

We published in No. 27, a series of questions from Mr. T. R. JAYNES, JR., (the printer by mistake set the name *Jones*), and we have received several replies from correspondents, giving a particular description of their methods of harvesting corn. We have put these aside to the appropriate season for the discussion of this subject, when it may be worth while to take up, the time of cutting, the relative advantages of "topping" the corn or cutting up the whole stalk, &c. We are obliged to our correspondents for any thing they write on this and other subjects, though we find it impossible to crowd into our columns all communications we receive. Writing down one's views always benefits the writer, even though the sheet should be consigned to the flames as soon as written. It helps him to think methodically. We will, however, give here one of the letters referred to above, and defer the others.

For the American Agriculturist.

ANSWERS TO INQUIRIES OF THOS. R. JAYNES, JR.

1st. *Cutting up the Corn.*—We will suppose the field to be square with the cardinal points.

Commence say near the north-east corner, at the fifth row from the east side, and walk in from the north side to the fourth hill. Grasp the whole of that hill a little above the ears, by the left hand, and with one blow from the knife in your right hand, cut off all the stalks just above the ground, and stand them up carefully against the north side of the hill before you. Then go to the south side, cut up a hill and stand it up in the same manner on that side; then turn to the west, and place a handful of stalks on that side of the standing hill; and do the same on the east side. Now grasp a hill and cut it off, then another and other, until your left hand is full; then step to the shock and set up your handful. So go on round and round the stock until its base is three feet in diameter; the top will not be half that. Bind firmly near the top, and the shock will shed rain well, and stand for months if you wish.

Straw is better than corn stalks for binding, but the latter are so much more convenient, that nineteen-twentieths of the corn in Western New-York is bound with them.

Pick up any stray ears that may fall from the stalks and crowd them into the side of the shock. The way I have planned it, nine rows of corn make one row of shocks; but the number of hills it would be best to put in a shock, depends, of course, on the size of the corn. If winter wheat is to follow the corn, as is often advisable, put fifteen rows of corn in one row of shocks, making a greater number of shocks in a row, and then you will have good-sized plow lands between the rows of shocks.

2d. *Gathering the Corn.*—When the grain has got dry and hard, take a jack-knife, and crowding open the bottom of the shock cut off the hill left standing. Lay the shock down on one side, unbind the top, and take a comfortable seat on one side of the pile of stalks, and if the weather be pleasant, you have the most agreeable work of the season before you.

Husk so as to leave the husks on the stalks, and when you have got your lap full of them, bind them into a bundle and throw it aside. Put all the bundles made by two shocks into one shock and bind it firmly at the top. If my stalks are dry, I draw them into the barn immediately after husking, and they keep well and make good fodder for cattle. If left out, they should be made into stacks, not exceeding ten feet in diameter, though some leave them in shock until foddered out.

The advantages of our Northern practice are these.

1st. The ground is left beautifully clean for the plow.

2d. The stalks make much good fodder, and what are not eaten, soak up the juice of the stable or yard and make good manure.

3d. The cobs retain less dampness; and the corn can be husked as rapidly as by any other method.

4th. I should say a man could cut up fifty per cent. more corn than he could "top."

M. HURLBERT.

Arkport, Steuben Co., N. Y.

Answers to Mr. HURLBERT's apple question will be given in a week or two.

SOWING CORN FOR FODDER.

As spring is upon us, it is reasonable to suppose that every practical farmer is laying out certain grounds for his various crops; and as the period in the history of agriculture has arrived when all farmers must economize, by putting in those crops which will most remunerate him for his labor, as a means to effect this end, allow me to call the attention of practical agriculturists to the subject of sowing corn for fodder.

Last spring, I sowed about three acres of corn, intending to cut it green for soiling, but owing to the favorableness of the season for grass, but one acre was cut—the other two was cured for fodder. I have no doubt the produce from the one was equal to ten acres of ordinary grass made into hay. The best way to raise it, is to plow and harrow the ground as if for corn or potatoes; then start the plow and let a man or boy follow and drop every other furrow until the piece of ground is completed; then run the roller over it and it needs no more attention. We put three and a half bushels of seed to the acre. I would prefer putting it on a piece of ground that was not to be seeded, in order to save labor in the curing. All that would be necessary is to cut and shock as other corn, and let it stand until dry, then bind it in sheaves and haul it to the barn or shed, and salt it. Cattle eat it with great avidity, and milk better than when fed on hay. We propose putting down from ten to fifteen acres this spring, and calculate to save twofold by the operation. First, in curing hay there is almost always difficulty in procuring men even at the highest

wages. Second, instead of mowing from forty to fifty acres we will have them for pasture, which does not impoverish the land like mowing. I think there is no crop which will pay better than sowed corn. Let our farmers try it.—*Delaware Republican.*

TRANSPLANTING SHADE TREES.

The following article is from a practical nurseryman, who speaks from experience—and contains some good hints. We have another article from the same source, on the "Diseases of Fruit Trees," which will appear soon, and we hope the writer will, as he hints he may, continue to give to others the results of his own long experience. But read his communication:

For the American Agriculturist.

I know of no subject that should be of such general interest, and so worthy of general attention, and yet so universally neglected, as the setting out of ornamental shade trees, along the avenues, walks, and highways of our country towns. No person of good judgment and correct taste will deny the truth of my introduction. Neither do I know of any investment of an equal amount of funds—as judiciously and carefully expended as the merchant does in the selection of his stock—that will pay better in the improvement of property, in the satisfaction, comfort and contentment to be derived in the enjoyment of their growth, thrift and success. To make home pleasant and attractive, is a study worthy of any mind, however aspiring or lofty.

There has been much attempted, sometimes with success, oftener with mortifying failures, particularly with the novice; and the reason is obvious. It is to save the paltry shilling temporarily gained by employing cheap hands that will undertake for a trifle less, what they really know but little about. I have known common swamp trees furnished, set out, and warranted to live, for fifty cents a tree, the common price for a good nursery plant as it stands in the nursery. Now there is nothing more ridiculous than this guarantee to *live*; just as if the seller could insure life against his own ignorant planting, severe drought, accidents by the cattle droves, and against the thousand and one mischances to which trees as well as human beings are liable. To warrant a tree to live, is the greatest possible injury you can inflict upon the purchaser of trees, for the simple reason that he feels no kind of responsibility or interest in their safety, and consequently neglects and leaves to others what needs his own personal supervision and care.

But such trees as I have seen disposed of in this way, I should want warranted to die. Not that I would entirely reject all our native forest trees. Not at all. There are many of them that are fine, and with care succeed well. The Sugar and Scarlet Maple, Linden, Horse-chestnut, Elm, and the Tulip tree or White-wood as we commonly call it—esteemed in about the order named—are among our finest native trees, valuable for transplanting. But I would say that in removing them, by all means employ the hand that will do it the best, and not the cheapest.

With a shrewd eye to form, symmetry, and habit of growth, choose your plants from open and exposed situations on upland, and not in a swamp or copse of wood where the plant has had no chance for spreading its branches. Now let the digging up process be done in the very best manner. No after culture will compensate for, or begin to repair the mischief done by careless and slovenly lifting.

Don't lift your tree with a crowbar and a yoke of oxen, but dig a trench entirely around it, and far enough off to retain the small fibrous roots—the life and soul of the tree—then undermine the tree by digging below the roots, so that the great body of dirt will have room to

crumble away into the trench, and you will find your roots in order for sustaining the plant in future. But I have never known this process alone to answer for the *Tulip tree*. I have never seen this tree removed in the ordinary way and grow, it invariably dies, at least as far as my observation extends. The tap-root of the *Tulip tree* is a very important root, almost the whole life of the tree, as a general thing out growing the other roots, and growing quite straight down, so that it cannot be removed by any reasonable digging. This will readily account for the difficulty of transplanting a tree of this species of much size successfully. Now to the proper way:

Select twice the number of trees you think you will need from among those about half grown to the size you wish them for removal. Choose handsome trees, in an open situation. Choose a time when there is easy digging if possible, and with a good steel spade dig down only on one side of the plant till you reach the tap-root, about 8 or 10 inches from the surface of the ground, at any rate below the branching roots. Clear away the dirt, and with a saw cut off the tap-root twice, sawing out a piece full two inches long to make sure work of it. Replace the dirt, marking all plants thus treated, and leaving them to stand where they are three or four years, or until you wish to remove them. Then go home and make a memorandum of your work, how and when done, (April, May or June,) not forgetting to credit the *American Agriculturist* for the little piece of information that enabled you to remove successfully one of the most beautiful native shade trees within your reach.

But my chapter is ended, and my story only begun. You shall hear from me again, giving a select list of ornamental shade trees of the nursery, and the reason why they generally succeed better than wild trees—the proper manner of setting out, &c., &c. W. D.

Morristown, N. J.

For the American Agriculturist.

TURNIPS FOR COWS—SUPER-PHOSPHATE.

I NOTICED an article in the *American Agriculturist*, (No. 2 of present volume,) respecting the value of turnips for cows giving milk. With all due respect to the writer, I would say that his experience differs very widely from mine. That there is a very great difference in value of the different kinds of turnips for feeding, any farmer of the least observation who has ever tried them must be willing to admit. My experience with the different kinds is somewhat limited. I must confess, however, I have tried the Swedish, the common white flat, and a variety called the yellow Aberdeen. For fear of being too lengthy, I will only give my experiment with the last-named variety, which I consider superior to the common white, yet not so valuable as the Swedish turnip. Last fall I gathered from about one-third of an acre of ground, 220 bushels of as fine turnips as ever grew. When grass failed, and I was obliged to commence feeding my cows on fodder, I gave to each cow one-half bushel of turnips each day. My cows were confined in a yard, and not permitted to go out except to get water. Their food besides turnips was corn stalks of a very poor quality. The cows had given milk since last May, and were nearly dry when I commenced feeding the turnips. They began in a few days to increase in their milk until they gave nearly as much as when they were on fresh pasture. Without wishing to boast, I will give you the amount of butter we have sold since the first day of January last, being what two cows have made since that time, over what we have used in our family which consists of six persons. The amount sold since January 1st, is 31½ lbs. of as nice yellow butter as could be made from the same cows in the month of May. Besides this we have sold several gallons of milk to one of our neighbors. The cows have kept in fine con-

dition during the whole of the time, without any grain at all.

I have fed a good many turnips to my horses, and consider them worth half as much as oats for horses, fed once a day with other grain.

As a table turnip the yellow Aberdeens are preferable to the common white turnip.

These turnips were raised on very poor land, which had a dressing of super-phosphate of lime, at the rate of 500 lbs. per acre. They were sowed in drills, fifteen inches apart from drill to drill. If you would publish an analysis of the different kinds of turnips, showing their value for feeding as compared with carrots, beets, and parsneps, you will much oblige a subscriber to your valuable publication.

I made several experiments with guano, bone phosphate, and mineral phosphate on wheat last fall, and if you desire I will detail to you the result, if life and health be spared until harvest. Have any of your correspondents ever tried the mineral phosphate on corn, if so I should like to hear from them. D. S. GRAY.

Beltsville, Prince George's County, Md.

We shall be glad to receive the details of the experiments upon wheat. We prefer farmer's experiments to analyses, though chemical analyses are valuable as suggesting experiments.

We have omitted in the above communication, as we do in all others, to mention the name of the manufacturer of the super-phosphate. There are in the market several articles under this name which we consider equally good, if honestly made. See another column for our opinion of super-phosphate.

DIRECTIONS FOR MAKING CAPONS.

THE following directions for caponizing, are furnished us by a gentleman who has had many years' experience in the business. They have been published in part before, but at our request he went over them carefully, and added such particulars as he thought advisable to make them complete. We have seen dressed poultry of his caponizing, and found them very fine. Any one desiring implements for operation, can be furnished them after the Chinese pattern, which the writer considers the simplest and best he ever used.

Fowls intended to be caponized must be kept at least twenty-four hours without food, otherwise the entrails will fill the cavity of the belly, and render it almost impossible to complete the operation; besides, when they have been starved the proper length of time, they are less liable to bleed.

The chicken is taken at any age, from five days' old, until it begins to crow, or even after. Lay the fowl on its left side on the floor, draw the wings back, and keep it firm by resting the right foot on its legs, and the other foot or knee on its wing. The table with the apparatus does away with the necessity of this stooping position. Be careful that the head of the fowl is not held down, or even touched during the operation, as it would be sure to cause it to bleed. Pluck the feathers off from its right side near the hip joint, in a line between that and the shoulder joint; the space uncovered should be a little more than an inch square. Make an incision between the two last ribs, having first drawn the skin of the part backward, so when left to itself it will cover the wound in the flesh. In some fowls the thigh is so far forward that it covers the last two ribs; in which case, care must be taken to draw the flesh of the thigh well back, so as not to cut through it, or else it would lame the fowl, and perhaps cause its death in a few days after the operation, by inflaming.

The ribs are to be kept open by the hooks—the opening must be enlarged each way by the knife, if necessary, until the testicles, which are

attached to the back bone, are entirely exposed to view, together with the intestines in contact with them. The testicles are included in a thin skin, connecting them with the back and sides—this must be laid hold of with the pliers, and then torn away with the pointed instrument; doing it first on the upper testicle, then on the lower. The lower testicle will generally be found a little behind the other—that is, a little nearer the rump. Next introduce the loop, which is made of a horse-hair or a fibre of cocoa nut; it must be put round the testicle which is uppermost, in doing which the spoon is serviceable to raise up the testicle and push the loop under it, so that it shall be brought to act upon the part which holds the testicle to the back; then tear it off by pushing the tube towards the rump of the fowl, at the same time giving it a quick sawing motion. Then scoop it and the blood out with the spoon, and perform the same operation on the other testicle. Take away the hooks, draw the skin over and close the wound; stick the feathers that you before pulled off, on the wound, and let the bird go.

Remarks.—If the operation be performed without sufficient skill, many of the fowls will prove not to be capons; these may be killed for use as soon as the head begins to grow large and get red, and they begin to chase the hens. The real capon will make itself known by the head remaining small, and the comb small and withered; the feathers of the neck or mane will also get longer, and the tail will be handsomer and longer; they should be kept to the age of fifteen or eighteen months, which will bring them in the spring and summer, when poultry is scarce and brings a high price. Take care, however, not to kill them near moulting time, as all poultry then is very inferior. The operation fails, principally, by bursting the testicles, so that the skin which encloses the soft matter, remains in the bird, and the testicle grows again. The cause of the bursting of the testicle is, that the front part of it, is more delicate and tender than the string which attaches it to the back bone—this presents the chief difficulty of the operation, for if the least force is used, while giving a sawing motion to the loop, in separating the testicle from the back bone, it bursts in front, and the bird will prove a red head.

Birds of five or six months are less liable to have the testicles burst in the operation than younger fowls, but they are more apt to bleed to death than those of from 2 to 4 months old.

A skillful operator will always choose fowls of from two to three months; he will prefer also, to take off the lower testicle first, as then the blood will not prevent him from proceeding with the other; whereas, when the upper one is taken off the first, if there should be any bleeding, he has to wait before he can take off the lower testicle.

The large vein that supplies the entrails with blood passes in the neighborhood of the testicles; there is danger that a young beginner may pierce it with the pointed instrument in taking off the skin of the lower testicle, in which case the chicken would die instantly, for all the blood in its body would issue out. There are one or two smaller veins which must be avoided, which is very easy, as they are not difficult to see. If properly managed, no blood ever appears until a testicle is taken off; so that should any appear before that, the operator will know that he has done something wrong.

If a chicken die, during the operation, by bleeding, of course it is as proper for use as if it bled to death by having its throat cut; they very seldom die after, unless they have received some internal injury, or the flesh of the thigh has been cut through, from not being drawn back from off the last two ribs, where the incision is made; all of which are apt to be the case with young practitioners.

If the testicles be found to be large, the bamboo tube should be used, and it should have a strong cocoa-nut string in it, for small ones the silver tube with a horse hair in it, is best.

When a chicken has been cut, it is necessary before letting it run, to put a permanent mark upon it; otherwise it would be impossible to distinguish it from others not cut. I have been accustomed to cut off the outside or the inside toe of the left foot, by this means I can distinguish them at a distance. Another mode is to cut off the comb, then shave off the spurs close to the leg, and stick them upon the bleeding head, where they will grow and become ornamental in the shape of a pair of horns. This last mode is perhaps the best, but it is not so simple and ready as the first. Which ever mode is adopted, the fowl should be marked before performing the operation, because the loss of blood occasioned by cutting off the comb or a toe, makes the fowl less likely to bleed internally during the operation.

It is very common, soon after the operation, for the chicken to get wind in the side, when the wound is healing, between the flesh and the skin; it must be relieved by making a small incision in the skin, which will let the wind escape.

Those fowls make the finest capons which are hatched early in the spring; they can be cut before the hot weather comes, which is a great advantage.

Never attempt to cut a full grown cock; it is a useless and cruel piece of curiosity. I have never known one to live.

The first efforts at acquiring this art should be made on dead subjects; this will save the infliction of much cruelty.

Be not discouraged with the first difficulties; with practice they will disappear; every season you will find yourself more expert, until the cutting of a dozen fowls before breakfast will be a small matter. The best time for operating is early morning.

It may be well to give a warning against becoming dissatisfied with the tools. A raw hand, when he meets with difficulties, is apt to think the tools are in fault, and sets about to improve them and invent others; but it is only himself that lacks skill, which practice alone can give. I have spent money, besides wasting my time in this foolish notion, but have always found that the old, original tools, which came from China, and where this mode of operating was invented, are the best.

Take care that the tools are not abused by ignorant persons attempting to use them; they will last a person's life time if properly used; but if put out of order, none but a surgical instrument maker can repair them properly.

The object of giving publicity to this, is to have the markets of Philadelphia and the other cities of the Union, well supplied with Capons; "they have ever been esteemed one of the greatest delicacies, preserving the flavor and tenderness of the chicken, with the juicy maturity of age." In the Paris and London markets, double the price of common poultry is obtained for capons.

Considering the abundance and excellence of poultry in the United States, it seems surprising that the art of making capons should be almost entirely unknown—it is hoped that this deficiency will now be supplied.—J. G. WISSAHICON, near Philadelphia.

GUANO AT HOME.

THE anxiety felt in the public mind on the guano question, the discussion of probable substitutes at a cheap rate, and the temptation of "present prices," induce us to still pursue a subject so fraught with interest to the agriculturist. Though guano, at half its price, may not be obtained in illimitable quantities, there are many substitutes of a value nearly approaching it, which may be available at our very doors. Its economical qualities are extreme portability, high solubility, and cheapness, from its being useful only for the land, and therefore having no great competition from the manufacturing classes. For portability, we do not know its equal. Most manures contain vast masses of

inapplicable material. We hardly know any perfectly free from useless compounds or from water. They are bulky or heavy, for instance, in proportion to the fertilizing material. Chemistry has shown that on ordinary cultivated land, phosphoric acid and ammonia are amongst the principle means of obtaining a crop of almost any kind; and though it would not argue that either carbon or lime, or possibly potash, could for ever be dispensed with, still they are the leading features of all good manures. And there are few manures which can be purchased, which are holding their elements so free as to be directly assimilated—ammonia ready formed and bone earth very finely disintegrated; (but most of them have to change) and yet so safely held that ordinary preservation will prevent their dissipation and loss.

Though we are not sanguine as to any real substitute for guano, equal in fertilizing elements, illimitable in quantity and for one hundred shillings per ton, we say we still think we have home resources of vast agricultural value. We allude not here to the sewage of towns—immense as is the value which they possess—because we think we know not, at least as yet, sufficient to say which process shall be applied to every town in the kingdom with its black, stagnant, poisoning effluvia stagnating and destroying all around by fever and cholera, and a thousand other unsuspected and unseen diseases.

Attention has been directed to our internal resources in various ways, from cattle bones to locked-up coprolites; but an idea of the origin of guano will at once point out to us some sources of partial supply. The guano islands contain 27 millions of tons of guano, or 967,680 million ounces. Vast as is this quantity, it might be deposited by 409,899 birds, if each voided only one ounce of excrement per day, in say six thousand years. And this is all decomposed fish—first, with all the gelatine dissolved out to build up the bird structure; then the bone earth finely pulverized by the process of digestion, assisted by the waste; the urinary or ammoniacal discharge of the birds all incorporated in the dung, and this denuded of moisture and a little reduced by fermentation under a hot sun and in a rainless atmosphere. Rievera saw the dung itself, from being white, change color, during his survey of those islands by the process of fermentation.

And have we no cheap fish, no refuse? and have we no chemical agent which can imitate the sea-bird's gastric juice, to reduce the fish and refuse to some portable, some concentrated, and some cheap manure? Let it not be supposed we are puffing Pettitt's process of drying and rendering soluble in sulphuric acid, or Green's cheaper and more simple process of making fish manure; but we have vast amounts of cheap fish and of fish refuse and waste, which are of immense agricultural value. Every fishing town witnesses the most disagreeable of all sea-side scenes—heaps of fish entrails and dead dog-fish thrown sweltering on the sands, and offending the senses both of smell and taste, in a degree which it is surprising the "spawners" submit to for a moment.

For more than 40 years, fish have been used as manure. The sticklebacks, which abound in the slow streams or rivers in the marshes, are so numerous as to sell for as little as eight-pence per bushel; sprats have been successfully used in hop-grounds in Kent. The refuse of the pilchard fisheries in Cornwall have long ago proved an excellent manure. It was even calculated by Mr. William Young, of Inverurie, that the refuse of the herring fishery of Scotland alone, if preserved and made into compost—the bulky nature of making in his day—they would suffice to manure 3,600 acres of land.

Dr. Apjohn, in a recent paper before the Royal Agricultural Improvement Society of Ireland, and referred to at the English Society last week, shows the agricultural value of fish to be very great. He analyzed the haddock and the whiting, and found that the former contained 3.53 per cent., and the latter 3.43 per cent. of nitro-

gen, and that dried, they contained respectively 13.76 per cent., and 14.43 per cent.

He calculates that abstracting the oil, which is worth in some fish a considerable sum, drying the fish, and treating with sulphuric acid, the sprat and the herring, though worth £3 per ton, are more calculated to make fish guano than either the haddock or the whiting, which with refuse can be had at half that price.

He gives us the analysis of a specimen of the fish guano prepared according to Pettitt's plan, which he had analyzed, and the constituents are many of them of great agricultural value. They are as follows:

Water expelled by a heat of 212 degs...	8.06
Sand.....	0.33
Oil.....	2.40
Organic matter.....	50.72
Super-phosphate of lime.....	9.85
Sulphate of lime hydrated.....	19.62
Sulphate of magnesia.....	0.71
Sulphate of potash.....	2.05
Sulphate of soda.....	2.42
Chloride of sodium.....	1.12
Sulphate of ammonia.....	2.72

100.00

The per centage of sulphate of ammonia, or of ammonia in any form, will at once strike those acquainted with the valuable parts of guanos, but it is considerably understated when calculated as nitrogen; for though the saline ammonia is only about 0.67 per cent., the ammonia equivalent to nitrogen of organized matter amounts to 9.46 per cent., in all giving 10.13 per cent. of ammonia. The question occurs, does this stand equivalent to 10.13 per cent. of ready formed ammonia? This we must see experimentally tested; but we must also bear in mind that if decomposition is required to develop the ammoniacal contents of the fish guano, the phosphate is more soluble than it is in the natural guano. In the latter it is simply bone earth or finely comminuted phosphate of lime; in this it is the super-phosphate, arising from a small quantity of free sulphuric acid. Dr. Apjohn estimates the value of the constituents thus:

Ammonia.....	6.00 pence per lb.
Bone phosphate.....	0.75 "
Gypsum and accompanying sulphate....	0.16 "
Bi-phosphate.....	3.75 "

Giving the fish guano as worth £9 10s. 9d. per ton. It applies the same tests as to price to Peruvian guano, and it is worth £10 18s. 6d. per ton.

These facts alone, without either condemning or recommending Pettitt's, or Gautier's, or Green's process, show that we have the elements at home of making some not very despicable substitutes for guano.—*Mark Lane Express.*

ELASTIC STEEL DIGGING FORKS.

AN ENGLISHMAN CLAIMS THE HONOR OF THIS YANKEE INVENTION.

AT page 9 of our current volume, we recorded the fact that Mr. HENRY PARTRIDGE, of Midfield, Mass., was the first inventor and manufacturer of the "Elastic Steel Digging Forks." But it seems from the following article, that a Mr. PARKES, of England, now very modestly claims the improvement. We should be glad if Mr. P. would inform the public when he commenced these improvements. We opine it was soon after and not before the opening of the Crystal Palace in London, when the American Elastic Steel Fork, manufactured in Massachusetts, was first exhibited to the British public. These unquestionably were their first models to work from.

LONDON, Dec. 5, 1853.

MESSRS. BURGESS & KEY, Newgate street.

Agreeable to your request, I proceed to describe to you the origin of steel forks for digging manure and other purposes, and the ad-

vantages to the consumer which they possess over every other implement of the kind. I have for many years been tool-maker for the majority of the London market gardeners. My first effort to serve them was by improving their spades and hoes; the improvement in the spades consisted of plating the front side, or upper surface of the spade, with cast steel, so as to impart to the implement the property of wearing itself to a knife edge and to a peculiarly bright surface, which scarcely any soil would adhere to. My next effort to improve this article was to shape the iron and steel so as to produce a solid plate or blade, gradually increasing in strength from the edge to the center, and again wedge-like from the edge to the top or shank, which places the weight of the implement so near the hand, that, although it possesses great weight and force in its downward blow, to cut through roots or turf, it does not rise or lift heavily. And there is also a novelty in the mode of joining the wood and iron part of the handle, as you will see by the one which is now exhibited (No. 1.) Instead of the iron covering the wood, as in the usual mode of construction, the wood covers the iron; and wood being a non-conductor of heat, comparatively with iron, the implement is much pleasanter to handle during the cold of winter.

My next attempt was to improve the three-prong dung-fork then in use. Having made some to pattern supplied by Messrs. Fitch, of Fulham, good in shape, but the prongs formed of $\frac{1}{2}$ round iron, tapered a little and pointed, I was dissatisfied with them, as being cumbersome and heavy. I then conceived the idea of making one of steel, sufficiently light and well-tempered to be elastic; but being aware that the prong of a fork would be tested far more severely than sword blade, bayonet, rapier, or any thing of the kind, I determined upon selecting a good quality of cast steel, and tempering it as skillfully as my many years of experience would enable me to do, and to make the prongs of such a shape that the end section should be an oblong square, as shown by No. 2, now exhibited, thus offering the greatest resisting power to the strain occasioned by lifting a weight of dung or litter, and giving the more flexible elasticity in the direction that the fork was likely to become wedged or expanded, and was eminently successful—so much so, that Mr. W. Fitch subsequently told me that his man had then a fork in use which he had taken to London with the dung-cart every day for two years, and that it had never cost him one penny in repairs—in contradistinction to the iron forks, which, when in regular use, cost threepence every fortnight at the blacksmith's shop for pointing—and, to use the man's own expression, it was at that time the best fork that ever was stuck into a pit of dung. I next saw the desirability of making a four-prong fork, for decomposed dung, compost, short litter, and various other purposes. Here arose the difficulty. I had been substituting a fork made of $1\frac{1}{2}$ lbs. of steel for one made of $3\frac{1}{2}$ lbs. of iron; and, to make this good enough to stand its work at such a weight, I had seen the necessity of making the fork from one piece of steel, without incurring the risk and uncertainty of welding or joining prongs together. Now, in case of a three-prong, this was very simply and readily done, by cutting a piece of steel and partially dividing it into three parts, and then driving out the two outside parts, so as to form it into the shape of a crucifix. The three parts were then drawn out under a till hammer to the desired length and strength to form the prongs, and the outsides or arms of the cross bent down again in the required shape for a fork. But to form a four-prong fork was altogether a different matter. The difficulty was at length overcome in this way: A piece of steel was cut and divided up the middle, and then extended, and the ends partially divided; the two ends were then drawn out under a till hammer, extending the two prongs; the division was then completed, and the two inner prongs forced down into their place. When this difficulty was overcome, and

we were able to forge any number of prongs from one piece of steel, subsequent experience has proved to me that forks of any given number of prongs (as the nature of the land may require) are the most efficient digging instruments, and the most durable. Steel being a material susceptible of crystallization, is necessarily preëminently durable by crystallization; and such durability is impaired to a very trifling extent only by the subsequent tempering, which imparts elasticity. The elasticity of the fork proves to be singularly advantageous to the operation upon the soil. When the hardness or adhesiveness of the soil, or the intersection of roots, offer more than ordinary resistance, and more pressure has to be applied, as soon as the release takes place the prongs spring forward with sufficient force to disseminate the soil in thousands of particles; or when the workman strikes a clod with the fork in an oblique direction, the prongs—possessing all the vibrating power as seen in the tuning-fork—will disseminate the soil into the minutest particles. It will be obvious that the fine-pointed prongs (as No. 4) must penetrate the soil, under any circumstances, much easier than the edge of a spade, however sharp; and experience has proved to me that there is not any soil in this country—when ordinarily moist, as in the digging season—but will hold together sufficiently to be raised up and turned over by this implement. No. 5 is sufficiently strong for a most adhesive soil. No. 6 is adapted to sub-soil digging, and is capable of breaking up concrete. A fork of the same weight as No. 6, with flat prongs, or say these prongs reversed, is best adapted for a soil where boulders abound. A fork of the shape of No. 6 holds the boulders between the prongs too firmly when they happen to be forced in. No. 7, with either four or five prongs, is best shaped for digging potatoes; the fine-pointed prongs pass through the soil with such facility that it induces a quicker motion of the workman's hand, consequently has more opportunity of bringing all bulbs and fibres to the surface. The old-fashioned flat-pronged potato fork brings the soil forward too much, and buries the rubbish, and, I am quite sure, will soon go out of use. I had a laborer, three years ago, who dug one acre of potatoes in seven days—the land in a very foul state, which he left clean and apparently in fine tilth—with a fork of the precise shape and weight as No. 7. His mode of working was as follows: With the fork he flung the potatoes out all over the surface of the land, not stooping to put his hand to them at all, and with a dexterous movement of the fork he places the haulm and couch grass on one side. He had two children to collect the potatoes into baskets; and in the evening of each day he would collect the rubbish together, passing his many pronged fork over the entire surface, and left his land as neat as a well-worked garden. No. 8 is a solid bright cast steel draining or bottoming tool, a little more than half the weight of other tools made for the purpose. This tool is used in a four foot drain, at a time when the cutting is already three feet four inches deep; and the workman has only room to stand with one foot placed behind the other, and has to lift the earth frequently above the level of his own head. Hence the necessity of a light tool, combined with the greatest amount of strength; and the demand made upon you by the public for these implements will show how they are appreciated.

FRANCIS PARKES.

Birmingham.

CLAIMS OF AGRICULTURAL PATENTS

FOR THE WEEK ENDING MARCH 21, 1854.

GRAIN AND GRASS HARVESTERS.—Henry Green, of Ottawa, Ill. Ante-dated Sept. 21, 1853: I claim, first, the V-shaped space or zig-zag shape of the rear of the sickle teeth, or the equivalent thereof, the angles of which press the substances back which collect upon the fingers, and prevent them from clogging the sickle.

Second, extending the rear ends of the sickle teeth back behind the sickle bar whether made

as represented or broader, or extended back at a point.

Also sharpening said rear-ends so as to cut off any stalks, grass, etc., which may collect upon the fingers between the sickle and stock.

Third, terminating the sickle stock at the inside of the rail, and fastening them together, as described, thereby permitting the sickle and stock to travel near the ground and parallel with it, while the rear end of the carriage is carried so high as to clear the grass or grain cut at the previous swath.

HARVESTERS.—P. H. Kells, of Hudson, N. Y.: I claim laying the bar which carries the cutting teeth, ranging with the guide roller and perpendicular to its side face, when the axis of said roller is parallel to the axis of the driving wheel, for causing the cutter bar to conform to the surface of the ground passed over and for the prevention of accidents to the cutting teeth as set forth, said bar being on the gearing side of the machine.

CONCAVES OF CLOVER HULLERS.—Thomas Carpenter, of Manlius, N. Y.: I claim the manner, as set forth, of threshing or clearing the hull from the berry of clover seed, viz., by passing the seed between two cards, as described, one of the cards being attached to the surface of a cylinder, and the other attached to a concave surface, so that the wires of the cards are in contact. The cylinder being revolved while the concave is stationary, the hulls are rubbed off without danger of cracking the seed, the whole constructed as described.

DEVICES FOR PRESERVING HEN'S EGGS IN THE NEST.—C. V. Ament, of Dansville, N. Y.: I claim constructing a hen's nest with two peculiarly constructed and arranged chambers, which communicate with each other through a hole in the center of the nest, and self-adjusting false bottom under the same, the upper chamber being provided with a suitable nest and a number of false eggs for the hen to set upon; and the lower one is provided with a soft-cushioned surface for the eggs to fall upon, which is made of such shape that the real eggs, as they escape through the false bottom, are caused to roll gradually towards the edge of the bottom, and remain there until removed. The whole being constructed and arranged as set forth.

SEED PLANTERS.—David Wolf, and Herman Wolf, of Lebanon, Pa.: We claim the combination of annular, revolving, perforated plates with curved grooves on the under side thereof constructed as described.

GRAIN THRESHERS.—J. L. Garlington, of Snapping Shoals, Ga.: I claim the employment of a vertical revolving adjustable and springing disk, made elastic by means of a spring bearing against the end of its shaft, and adjustable by set screws which pass through the ends of the spring, and throw it into action to a greater or less extent, according as they are turned, and having a series of beaters set tangentially to its axis around its face, and another series placed radially round its periphery, in combination with a stationary concave, having a series of stationary strippers arranged tangentially to the axis of the revolving disk on the inner face of one of its sides directly under the passage where the grain is fed in, and another series of stationary strippers placed radially for a short distance round its inner periphery; the whole being constructed, arranged, and operating as set forth, for the purpose of effecting the objects specified.

MACHINE FOR DISTRIBUTING TYPES.—Victor Beaumont, of New-York city: I claim, first, the combination called distributing channel of the channel sides, the levers and slide, with two springs, and the lever and rod, or their equivalent, as described.

Second, the combination of distributing and receiving channels, with disk and ring, and eccentric shaft, or their equivalents, by which the distributing and receiving channels are brought into contact along a curve, the last element of which curve is perpendicular to their faces of contact, as described.

Horticultural Department.

THE LADIES' FLOWER GARDEN.

WE wish it were possible to transfer every lover of flowers among our fair countrywomen, for a few moments to England, to gaze upon the exquisite gardens and *parterres* which adorn that beautifully cultivated land. They would find many of these to be exquisite pictures, whose tone and coloring were kept up from the beginning to the end of the season; for as fast as one flower fades and gets out of season, in their lovely *parterres*, another is transplanted from an open pot in a garden out of sight, to take its place; and thus they are kept perfect and blooming during the whole season. But we have not yet arrived at this high state of art and luxury in this country, so we will forbear further remarks on things of such high finish, and proceed to notice such flowers as are within our reach, and which are easy of cultivation.

A few years since we passed some pleasant hours with Mr. A. J. DOWNING, at his charming home on the Hudson, and we noticed that his finely-laid-out grounds were interspersed with little patches of brilliant flowers, with scarcely an annual among them. He told us he had mostly discarded these, and in place of them substituted a few bedding plants, which he obtained every spring from the florists, such as a half dozen each of verbenas and petunias, with a smaller number of geraneums, salvias, and heliotropes, and some nice beds of portulaccas in variety. We have since learned the wisdom of this plan, and have found that a good selection would afford a succession of flowers during the season.

It is difficult to tell which names to take from the long lists, but we have found each of the following to give satisfaction, viz.:

Verbenas—The Defiance Heroine, Satellite, Magnificent, America, Rein de Jour, and the Madame de Gournay.

Petunias—Prince of Wales, Enchantress, Eclipse, Yorkville Beauty or Smithie, and Hebe.

Geraneums—Scarlet Defiance, and Princess Alice.

Salvias—Splendens Major, and Speciosa.

Heliotropes—Souvenir de Liege, and Corymbosom.

Double Fever few.

Climbers—the Canary-bird flower, and Cobea Scandens.

We love flowers so well, we should add all the varieties of Portulaccas, a few of the choicest German Asters and Paris Balsams, and a few Dahlias, such as Belle de Paris, Elizabeth, Sir F. Bathurst, Liebliche Von Elstenthall, Toison D'or, and Indispensable White. Also Lantana Ewingi, and Madam Sontag or Pearl of England, Fuschias, and perhaps others.

We have but one piece of advice to give about flowers, and that is cultivate no more than you will cultivate well. There is no sadder sight in a garden than neglected, half-starved flowers, while it gladdens the sight of the old as well as the young, to see them healthy and well developed.

A weak solution of guano (or even of poultry manure) is an excellent preparation for watering the roots of plants, either in pots or beds.

THE POT ROSE.

WE present above an engraving of this beautiful rose, which we have had engraved at considerable expense for the pleasure of our Horticultural readers. The original drawing is found in the *London Florist*, which paper has given us five articles describing the method of culture under the head of "Autobiography of a Pot Rose." Two of the more practical articles will be found on pages 114 and 184 of our last volume. The *Florist* informs us that the Prince of Gardeners at the great Chiswick Show, declared the specimen from which this drawing was made to be the finest he had ever seen. It received the gold medal of the London Horticultural Society.

We present it to our readers as a model of what good cultivation and skillful pruning can accomplish; and hope the time is not far distant when our floral friends will become so familiar with the whole process, as to approximate in the training of their plants to the specimen here presented.

A handsome shaped tree, or bush, or plant is always attractive, while the finest varieties if ill shaped are repulsive. A little knowledge and a little care will combine the excellent and the beautiful in the same plant, and thus afford a double source of pleasure.

A few months ago we were attracted to a florist's window by a very handsome Pomponé Chrysanthemum, which on account of its beautiful form readily sold for ten dollars, while an ordinary grown plant of the same variety could be easily obtained for fifty cents. This plant is

only an illustration of the idea we wish to impress, and that is, that whatever is worth doing at all, is worth doing intelligently and well; it pays best. This plant would sell for twenty-five dollars, while one of the same variety and age would not command more than half a dollar, and this difference mainly arises from good pruning. "Good pruning!" says a reader, "we do not know how to do that, neither can we learn from the directions we receive from books. We are told to cut off and pinch back the shoots, until the tree or shrub assumes a handsome, conical form, but never having seen or learned the process, our attempts would only result in failure."

True it is that so simple an art as pruning is not often learned even by an amateur, except he is favored with a practical demonstration by a florist in the garden, with a knife in hand.

Yet if it makes a fifty cent plant worth from ten to twenty-five dollars in the market, it is well worth making a special effort to learn, particularly when this whole process of pruning is to the amateur one of the most agreeable things connected with the care he bestows on his plants.

We hope our readers will take in hand some young roses and other plants, and by a courageous and thorough system of pruning, and pinching back the ends of the too vigorous shoots, check their growth until the feeble parts gain strength as well as beauty; we hope, we say, our readers will thus succeed in approximating if they cannot rival this beautiful Pot Rose.

WESTERN APPLES.

In an article referring to *local* fruits a short time since, we recommended their adoption in preference to others not so well known, by all who are about to plant new orchards. Our opinions were strongly confirmed a few weeks since while in the Miami and White-water Valley of Ohio, and Indiana. The wide reach of land embraced in these vallies; or rather the tract of champaign country through which the waters of those rivers flow, is a rich limestone soil, intermixed more or less with a friable clay, and underlaid with a coarse limestone gravel, easy to till, and of wonderful fertility. In the early days of March, a basket of several different varieties of apples were presented us for inspection and taste. They were in good keeping, and the following are the notes which we made at the time:

Yellow Bellflower.—We have never seen this fine apple in such high perfection of size, beauty, and flavor as in this region. It is decidedly the late autumn and winter apple of all that broad region, both for the table and cooking. It is slightly sub-acid in flavor, crisp, and juicy in flesh. The color is a golden ground, with a beautiful carmine cheek, which, with its large size, makes it the perfection of an apple in appearance.

Raules Jennet, or Never Fail.—This is peculiarly a Western apple. Medium in size, with a greenish, yellow ground, and broad, broken red stripes plashed over it. The flesh is white, juicy, crisp, slightly sub-acid, yet mild, and very agreeable in flavor. It is pippin shaped, and a good keeper.

Wine Sap.—In size, medium; deep red all over in color; pearmain shape; flesh yellow, sub-acid; juicy, mild, and pleasant in flavor. Stem short and thick; good keeper.

Black Apple.—Deep red in color, with small gray dots, full at the stem, and blossom ends; yellow, rich, and rather dry flesh; mild and sub-acid. Hardly equal to the Wine Sap.

Newtown Pippin.—This is a truly magnificent apple, double the size of the Long Island Pippin, in some instances quite equal to the Fall Pippin about New-York. It thrives successfully in that region, and is the highest flavored of either of the apples we tasted, maintaining the prominent characteristics of its parent at home in its peculiar ribbed shape, crisped flesh, and sprightly, juicy, delicious flavor; but these latter qualities somewhat *diluted*. This last characteristic somewhat appertains to all high flavored Eastern fruits which succeed at the West, owing probably to their larger growth and longer season.

Coarseness, and sometimes sponginess, or want of solidity, is a characteristic which the northern and eastern pomologist readily detects in western fruits, most usually accompanied by a dilution of flavor, particularly in such apples as he is accustomed to at home. We cannot too strongly recommend to our western friends, in all their fruit plantations, to hold on to the well established fruits of their own region for their main purposes, instead of experimenting to any extent on fruits from abroad, let their reputation be ever so inviting, provided, meantime, that their own fruits possess the qualities for which they are required.

THE CRANBERRY.

Concluded from page 38.

SINCE these varieties are not permanent, it follows that there is no certainty that the seed will produce a plant which will be similar to that from which the seed was taken. We cannot depend upon having a Baldwin apple from the seed of the Baldwin. The product may, indeed, be superior to its parent, or it may be inferior, but it will seldom be precisely similar to it. The seed of the black cranberry might produce the black, as it sometimes does. The same circumstances which gave such peculiar characteristics to the fruit from which the seed was taken, would probably give it the same. It is always safe and wise to select the best seed of the best fruit, of every description, to plant.

The question has often been asked, whether the two varieties, when brought together, would injure each other, or in other words, whether, if the black and the common oblong cranberry of the country, were transplanted into the same piece, and placed in the immediate vicinity of each other, the fruit of each would have all its original distinctive characteristics? If both varieties of vines ran together, as they naturally would, so that the dust or pollen of one would fall on and fructify the other, it is very probable that the fruit would have some of the characteristics of each variety. The inferior cranberry would, perhaps, be improved, and it is possible that the fruit so produced might be better than either alone would have been. Such is, to a great extent, the case with all accidental varieties of fruit; as when a variety of Indian corn, for example, is so situated that its pollen falls upon other varieties of the same grain, the effects are invariably seen in the different character given to the fruit of that on which it falls.

But, if our common American cranberry were intermixed with the small, or European cranberry, in the manner above described, the same amalgamation probably would not take place, from the fact that the species is different. There might possibly be an intermixture, but it would be very unlikely to occur.

The Cranberry Worm.—There is an insect which attacks the cranberry. Its history and habits are not yet fully known, though the subject is now studied so closely that they will probably soon be determined. The egg is supposed to be deposited in the blossom. From this egg proceeds a small caterpillar, which works its way through the fruit, eating the pulp and causing the green fruit to turn red prematurely and decay. It bears a striking resemblance to the apple-worm, and seems to be very much like it in its habits. This similarity has been observed by Dr. T. W. Harris, as appears by a letter from which the following extract is taken:

"Within the past two or three years, some complaint has been made of injury done to cranberries by insects. A sample of the injured fruit was put into my hands by the editor of one of our agricultural newspapers. The insects found therein were small, naked caterpillars, strikingly like those called apple-worms, or core-worms. Their habits seemed to be identical with those of these common predators. Each of the affected cranberries had been tenanted by a single worm, which had entered, when very small, and had devoured more or less of the pulp, filling its path with its blackish excrements. Not having traced this insect to its final state, I cannot positively assert that it is the same species as that which affects the apple; but if not the same, it is probably congenial or closely allied thereto. I am not acquainted with any other insect attacking the cranberry."

Others have observed a striking resemblance of the appearance and sensitive nature of this insect to the Palmer worm.

Two different remedies have been adopted for this evil. One is to flow the cranberry ground one whole year, thus losing the crop of one season, and the other is to sow salt upon the cranberry bed, at the rate of about five or six

bushels to the acre. On plantations which cannot be flowed, the latter will probably be found to be the only effectual remedy. If what has been observed be true, that cranberries growing on or near a salt marsh are superior to any others, it is also natural to suppose this application of salt would be beneficial to the cranberries, even if it did not destroy, or prevent the ravages of this insect.

Mode of Gathering.—In this country, the cranberry is generally gathered with a rake made for the purpose, with which twenty or thirty bushels a day can be taken from the vines. But on newly planted beds, or loose sand, there may be danger that this method will injure the roots, and it will not be found expedient, in such cases, to use the rake till the plants are very firmly rooted, and have covered the ground. But raking, in the majority of cases, so far from injuring the vines, is probably a benefit to them, when no other cultivation is practicable. In Germany, the small cranberry is gathered by means of wooden combs. In England and Scotland, where they are not found in so great abundance, they are generally picked by hand.

If I have dwelt longer on this subject than its comparative importance would seem to justify, it need only be stated that the cultivation of cranberries is fast becoming an important branch of our agriculture, more than one hundred thousand bushels of this valuable fruit having been gathered during the past season, from land which, for all other purposes, would have been comparatively worthless, while the demand for it here and in England is sufficiently large to absorb all that can be thrown into the market;—that the information on this subject was much scattered and inaccessible to many, and that great facilities were at my command for extensive and accurate observation of experiments, many of which had been tried so long that I could state conclusions resting on them, with some degree of confidence.

But, as I have before intimated, some questions relating to the culture of this plant, are still to be settled by experiment, and it is possible that time and future observation may require some modification of the opinions which have been advanced above.—*C. L. Flint's First Annual Report to Massachusetts Board of Agriculture.*

THE JEFFERSON PLUM.

Turner's Florist of London for February, 1854, says of this Plum:

This exquisite new American Plum, which came into notice a short time ago, proves to be a great acquisition; it is decidedly the best of its class, and fully merits the high character which accompanied its introduction. It has the advantage of large size with beauty and excellence combined, together with a fruitful habit, and all the hardness of our common kind.

GOD HATH A VOICE.

BY ELIZA COOK.

God hath a voice that is ever heard,
In the peal of the thunder, the chirp of the bird;
It comes in the torrent, all rapid and strong,
In the streamlet's soft gush as it ripples along;
It breathes in the zephyr, just kissing the bloom;
It lives in the rush of the sweeping simoom;
Let the hurricane whistle, or warblers rejoice,
What do they tell thee, but God hath a voice!

God hath a presence, and that ye may see
In the fold of the flower, the leaf of the tree;
In the sun of the noon-day, the star of the night;
In the storm-cloud of darkness, the rainbow of light;
In the waves of the ocean, the furrows of land;
In the mountain of granite, the atom of sand;
Turn where ye may, from the sky to the sod,
Where can ye gaze that ye see not a God!

American Agriculturist.

New-York, Wednesday, April 5, 1854.

SUPER-PHOSPHATE OF LIME.

DIFFERENT KINDS IN THE MARKET—HOW MADE—
THE BEST KIND TO BUY, &c.

In answer to frequent inquiries, we will give a few general statements on this subject.

Super-phosphate of lime, as most are probably aware, is made by dissolving phosphate of lime in sulphuric acid (oil of vitriol.)

There are three methods of making this:

1st. Dissolving *unburned* bones, ground or unground.

2d. Dissolving *burned* bones.

3d. Dissolving a native mineral phosphate of lime, called *apatite*.

Since *unburned* bones contain considerable animal matter, the super-phosphate made from these is the most valuable fertilizer, unless for land already abounding in organic matter.

The second kind, from *burned* bones, is generally better than the third, because the mineral phosphate usually contains more or less of foreign substances.

A greater portion, if not all, of the super-phosphate sold in the market, is made from *burned* bones. The manufacturers do not prepare bones for this purpose, but procure them ready *burned* from the sugar houses, where they have been used for refining sugar. The sugar refiners burn the bones away from the air, so as to preserve the animal charcoal formed from the organic part, and grind them to a powder. The sugar syrups are passed through this substance to purify them. After the substance thus prepared, (called *bone-black* or *bone-earth*,) has been used awhile, it is again *burned*, and again used. Sometimes it is re-*burned* and used *four or five times*, and then thrown out into a heap, or placed in the empty sugar hogsheads, and sold for a small sum to the super-phosphate manufacturers.

At these factories the *bone-earth* is mixed intimately with a portion of sulphuric acid, (oil of vitriol,) which changes the phosphate of lime in the bones (which has not been altered by the burning) into super-phosphate of lime. Sometimes the *bone earth* and acid are mixed by putting them in a cask and stirring or shovelling them well together. Others do the mixing with machinery. This last method is preferable, since the mixing is more thorough and uniform. The heat produced by the action of the acid upon the bone, is sufficient to expel the water and leave the mass dry. This substance, thus simply made, is the commercial super-phosphate of lime. It is of a dark color, almost like powdered charcoal.

Several manufacturers claim to improve this by mixing other substances with it, such as guano, sulphate of ammonia, &c. The addition of ammonia in some form is doubtless an improvement for grain and grass crops, and on poor lands, for root crops, though on most soils, if not all, we should prefer to buy the simple super phosphate, and add manure from the farm-yard or the compost heap. But a word about these extra substances added by the manufacturers.

Some claim to add sulphate of ammonia. Now this article is expensive, and we think we are

entirely safe in saying that five tons of sulphate of ammonia have never been purchased in this country, by all the manufacturers of super-phosphate of lime put together.

Others claim to supply ammonia from the gas works. In some recent inquiries, instituted for the purpose of ascertaining whether there were around the gas works of the city any materials that might be profitably used by our farmers as fertilizers, we could not learn that any of the ammoniacal liquors were saved by any person. We have been informed that in an adjoining city (Williamsburgh) there is a manufactory of sulphate of ammonia, but this probably does not at best supply more than enough for one manufacturer of super-phosphate. If there are other sources of the ammonia claimed to be used for this purpose, we shall be glad to be informed of, and chronicle the fact. There is, then, we believe, but one further source from which ammonia is obtained to add to the super-phosphate, and that is guano.

Several manufacturers do add more or less guano. This gives to the super-phosphate a lighter color and a peculiar odor. We shall be glad to know of a certainty, that no other substances, such as yellow earth, &c., is added to change the color and cheapen the manufacture. As far as guano is added, the article is certainly not made worse; for at the same price per ton we prefer guano to super-phosphate for all crops, except perhaps the root crops and old grass lands. As we have before stated, for some crops a mixture of guano and super-phosphate is doubtless better than either alone. But as we said in a former number, we advise farmers to buy the guano and super-phosphate *separately*, and make the mixture themselves, by thoroughly mixing the two together upon a floor.

What we recommend then is, that manufacturers should confine themselves to putting up the *simple* super-phosphate. This we advise farmers to buy for their old grass lands, for root crops especially, and in small quantities for *experiment* upon other crops, and upon gardens, trees, &c.

Notwithstanding all that has been written on this subject, we consider it yet an unsettled question, whether an indiscriminate use of super-phosphate of lime on other crops than turnips is profitable. We advise every farmer to try it carefully as an *experiment*. It can seldom do harm, it will generally do some good. *Will it pay?* We have heard of several instances where it has paid, but as a Connecticut correspondent justly remarked in our last number, "nobody is interested to chronicle the failures."

Fellow-farmers let us have both sides of the question. We do not want puffs or condemnations of this or that man's manufacture. *Honestly* made, super-phosphate is *essentially* the same thing, no matter by whom manufactured. We put no confidence in this or that professed addition of other materials. We want to know the effect of *super-phosphate of lime* alone.

If any one makes the article from *unburned* bones, let him frankly and openly so advertise it. If he adds other substances let him as frankly and openly state *what* and *how much* he adds, and allow farmers to see his daily process; and we advise him to tear down all suspicious "no admittance" signs from over the door of his factory. We are no friend to secret medicines for a sick body, or for sick land. If

the physician offers us a secret pill we eschew it, and so we treat secret manures, of whatever kind.

WHAT WE ARE DOING.—We think *our* readers capable of appreciating a good paper, and we do not deem it necessary to imitate some of our cotemporaries—in telling them from week to week how much we are doing. It is agreeable, however, to know that our labors are valued, and it is with no little pleasure that we daily meet such expressions as those contained in the following extract from a letter, sent us by an old farmer, to whom we are indebted for several subscribers:

" * * * * I have just received and read your *Agriculturist* of March 29; and allow me to say that I think you are not only going ahead of all other agricultural papers, (of which I take the best six,) but you are even excelling yourselves. In the number before me, I find some *thirty-five* columns of instructive, common-sense agricultural matter, almost all of which I see was written for your paper—I mean *our* paper—by its editors and correspondents. * * * I like to show my neighbors such a paper as you weekly send me, and let them see what a treat they can have for less than four cents a week. Please send me two or three extra copies as specimens." * * *

GUANO—HOW TO APPLY TO CORN.

A "FARMER" in *Windham Co. (Ct.) Telegraph*, thinks us wrong in our objections to putting guano into the hill with seed corn. He says, "cover it two inches with soil, and drop on the seed, and he will warrant not more than one kernel in a hundred will fail to come up."

With two inches of soil over the guano, the corn may "come up," but he may be pretty sure it will not "grow up" very high or thrifty. Every little root that penetrates to the guano will be destroyed. There may be side roots enough to keep the corn alive and support a partial growth. Guano is so caustic in its nature, that it needs to be *incorporated* with the soil thoroughly before it comes in contact with the roots. If applied at planting or hoeing, it should be placed at least four inches distance from the stalks in the hill, so that the corn will only receive the dilute washings of the guano.

We repeat, that experience has shown, the best course generally speaking to be, mixing the guano thoroughly with the whole soil, some time before sowing or planting. It will remain in the soil; the first roots will find but little of it, not enough to destroy them, but enough to supply their present demands; and as the roots extend farther and deeper, they will continually find new portions to supply the successive wants of the stalk and grain.

WHO KEEPS FOWLS FOR SALE?—Since the recent Poultry Shows, we have had, and are constantly receiving, numerous inquiries for all sorts of fowls. We cannot privately answer all such letters, and we suggest that to meet these wants, it will be for the interest of breeders of fowls and other animals, to advertise and particularly describe what they have to sell, giving the price, how they can be forwarded, and also stating the purity of the breed, &c. This course will bring breeders and purchasers into direct

contact, and save commissions and a variety of other expenses. —•••—

THE POULTRY CHRONICLE is a weekly periodical of 24 pages, small quarto, published in London. It is very prettily edited by a lady—Mrs. ELIZABETH WATTS. We are happy to comply with her request to exchange, and judging from the number before us, we doubt not we shall find many interesting and instructive articles to copy for our readers. —•••—

TO KILL LICE ON CATTLE.

EVERY man having any considerable number of cattle, cannot prevent more or less of them from occasionally getting lousy—particularly calves; but there is no apology for permitting the lice to stay upon them. As soon as discovered, take some grease of almost any kind—stale butter, hog's lard, pot skimmings, neat's foot or whale oil, and mix it with common brown or Scotch snuff—say an ounce of snuff to a pound of grease, and warm it so that it will work freely with a brush or the hand. Then open the hair of the creature where the vermin are thickest, and rub or brush the mixture thoroughly in and around wherever a louse or a nit can be found. This process will kill them effectually, as in numerous trials we have never known it to fail. If snuff be not at hand, the grease alone will answer; but the snuff renders the application more *prompt*, if not more effectual.

Young cattle should be examined frequently, to see if lice be upon them, particularly about the head, back of the ears and horns, on the brisket, down the twist, and just above the root of the tail. These are the places where they first congregate, and if early found will be easily exterminated by applications of the grease on those places alone.

Mercury, in any shape, should never be used. It frequently salivates animals when applied, and is sometimes fatal to them. Tobacco juice is not more effectual—hardly so much so, indeed, as grease—and if applied strong, and in quantity, is apt to sicken the animal; whereas grease, with the small quantity of snuff in it, prescribed as above, thoroughly destroys the vermin without injuriously affecting the beast. The only objection we have ever heard against the application of grease or oil, is that it occasionally causes the animal to shed its hair sooner than it otherwise would, and in spots; but this is nothing like so injurious as to let the poor creature remain lousy, or sicken with tobacco water. —•••—

WILD CHERRY BARK SYRUP,

SAID TO BE AN INFALLIBLE CURE FOR FEVER AND AGUE.

THE following recipe was handed us by a subscriber, who says it is very highly valued both by himself and friends.

We give the recipe as we received it, neither approving nor condemning. We have studied little into the causes or cures of ague. By carefully protecting our feet from dampness, by *avoiding exposure to cold currents while warm, or to damp night airs when not exercising*, and by adapting our clothing to the changes of the season without regard to the demand of fashion, we have thus far escaped the attack of ague and fever, though often very much exposed,

and we expect our bones will not be shaken asunder for some time to come, if we continue this same care. But some may want a "cure," and here is one said "never to fail."

Take $\frac{3}{4}$ of a pound of the inner bark of the wild cherry—fresh from the tree—and boil it an hour in two quarts of water. Strain off the liquor, add to it $\frac{3}{4}$ lb of sugar, and boil or gently simmer it down to $1\frac{1}{2}$ pints.

A dose of half a wine glass to be taken an hour before each meal. If commenced as soon as the premonitory symptoms of ague appear, or when only one chill has occurred, and pursued for a few days, it will break up the ague. After the ague is broken, take it twice a day, and then once a day for a week after the chill has elapsed, and about two weeks after take a dose daily for two or three days. —•••—

ERIE RAILROAD.

WE recently made a trip to Canandaigua, N. Y., going over the northern route and returning by the Erie R. R. Some of the notes we made may be interesting to our readers in Western New York, who will have occasion to visit this city the coming summer, for various purposes, and especially to visit the Crystal Palace—which by the way, notwithstanding the animadversions of some newspaper writers, gives fair promise of being open in all its former attractiveness, if not in additional splendor.

By the northern route we reached Canandaigua in thirteen hours and a half, at an expense of \$6.96. Returning by the southern route we reached the city in twelve hours and three quarters, at an expense of \$6.44, the latter route being thus both quicker and cheaper.

Another point more important still, is the greater comfort enjoyed on the southern route.

We chanced on the northern route from Albany to get stowed away in a narrow, poorly-ventilated, over-crowded, and over-heated car; and our first approach to the noxious atmosphere betokened something akin to suffocation, reminding us of the remark of one of our city dailies, that "the seeds of death are thus planted in several human systems every night." On the other hand, the wide, spacious, well-ventilated cars on the New-York and Erie must gladden every traveler.

The scenery on this route, even in mid winter, can scarcely be equaled in our whole country.

Our attention was particularly directed to the ride from Penn Yan to Jefferson, on the Elmira branch. At an elevation of from one to two hundred feet, we glided along on the banks of the beautiful Seneca; a lake unsurpassed for its loveliness and purity by any similar collection of fresh water in the world. It bids defiance to frost, so that in the memory of the oldest inhabitant, no day of our coldest northern winters has blocked it with ice, or obstructed for an hour the steamers on its waters. When the noble Hudson lies enchained with ice, the Seneca lake preserves its clear waters as limpid as mid-summer.

This lake, forty miles long, and from two to six miles wide, is surrounded with high sloping banks of the finest land, affording more desirable locations for beautiful country-seats, which gentlemen of fortune would naturally select, than any other place we have seen.

At one point, a small but handsome promon-

tory projects into the lake, and we wondered that some rural cottage did not already adorn the spot.

At times we were plunging through dense forests and over deep narrow ravines, but for the most part through highly-cultivated fields, in full view of the premium farms of Seneca County, lying on the opposite side of the lake.

We will not now refer to the growing villages of Elmira, Owego, Binghampton, Middletown, &c., nor to the romantic views presented at every leap of our iron horse, neither will we lengthen this article to speak of the striking evidences every where presented of the rapid agricultural and horticultural advancement, made since we visited this region, but a short time since. We propose to make a special visit, or visits, for this purpose after Spring has put on her gay attire, and the enterprise of 1854 has begun to develop itself in these departments.

It is hardly necessary to wander off to the Notch among the White Mountains, or elsewhere, when the citizens of New York have such a variety of wild, combined with highly-cultivated scenery, within a dozen hours' ride, on one of the noblest and best-managed railroads of which any country can boast. —•••—

For the American Agriculturist.

DEEDING LAND—A LAW QUESTION.

NOTWITHSTANDING the thousand and one ex-parte interrogations with which you are favored (?) from week to week, I take the liberty of troubling you with still another, which from your experience in agricultural matters, I judge you as capable as I know you will be willing, to answer.

A and B purchase a farm—set forth by the deed of (the seller) to contain 71 59-100 acres *more or less*. A and B proceed to divide the land, find it contains only 64 acres and some fraction of an acre. The seeming ambiguity, *more or less*, does it apply to, or mean the *fraction of an acre* more or less than 71, or does it mean in law, the 7 acres actually deficient.

Your answer will much oblige a constant
READER.

We are not lawyers, and with legal technicalities we have had—as we still desire to have—very little acquaintance. When a question of this kind comes up, our custom is to call in our common-sense-notions of the principles of justice, and we have generally found that, with these as our guide, the law has borne out our own decision. There are, however, some technicalities which can be twisted almost any way, depending for their decision upon the comparative skill of the pettifoggers who have them in hand. We will give our own common-sense-view of how the "law" would settle a question like the above.

If the seller purchased the land in *mass*, and sold it in *mass*, for a given price for the whole—71 59-100 acres more or less—and no intentional fraud could be shown, we suppose he would not be responsible for the deficiency. But if the land was sold for so much per acre—71 51-100 acres more or less—or if there could be shown any intentional fraud, or that he had at any time had the land measured, and might thus be supposed to know its extent, he would in that case, be liable for damages, and also be open to a direct charge of fraud.

The general supposition, however, is that the "more or less" applies to the fractional part of

an acre, and thus every one would understand it. So we think the *common law*, or a jury would decide. If the seller has been deceived, he recovers for damages upon the person from whom he purchased. The fact that the number of acres is stated, seems to cut off the idea of its being sold as a plot "more or less."

Since writing the above, we have received from a legal friend a few quotations from the highest authorities, and as this is a question of some interest we give extracts here. Kent's Commentaries, Vol. IV. at page 506, says:

The mention of quantity of acres, after a certain description of the subject by meter and bounds is but matter of description, and does not amount to any covenant, or afford ground for breach of covenant, though the quantity should fall short of the given amount. "Whenever it appears by definite boundaries or by words of qualification, as "more or less," that the statement of the quantity of acres is mere matter of description and not of the essence of the contract, the buyer takes the risk of the quantity, *if there be no intermixture of fraud.*

BARBER'S Report of Sup Court of New-York, says:—Where a specified tract of land is sold for a sum in gross, the boundaries of the tract control the description of the quantity it contains and neither party can have a remedy against the other for an excess or deficiency in the quantity, unless such excess or deficiency is so great as to furnish evidence of *fraud or misrepresentation.*

JOHNSON, says:—A deed was delivered to Mr. S. describing a lot, and as "containing 600 acres be the same more or less." On actual survey the lot was found to contain only 421 acres and $\frac{1}{2}$." The court held that the quantity was at the risk of the vendee, and that he could not require the deficiency to be made up.

DORR'S Law of Vendors at page 307, says:—Where the estate is professedly bought by the acre and the words "more or less" have been used, they have been held to cover a deficiency of upwards of five out of forty-one acres.

MONSON, Vol. 4, page 414 says:—A farm was sold without measurement, and represented to contain 47 $\frac{1}{2}$ acres, "more or less." The quantity turned out upon subsequent measurement to contain only 40 $\frac{1}{2}$. Mr. JUSTICE STORY held, that as the vendor was not guilty of any fraud, the vendee was not entitled to relief in equity.

A Cow bought for \$10, whose milk but just pays her keeping, affords less profit than one at \$30, giving twice the quantity of milk afforded by the former. Try it and see.

For the American Agriculturist.

THE FARMER.

Who is the independent man?
The farmer, he is one;
The changes and the cares of trade,
He's wise enough to shun.
Oh! what cares he for stock on 'change,
His farm is all his own;
Or what for creditors' loud dun,
He reaps what he has sown.

And who is rich, if 'tis not he?
With harvest yet in store;
It matters not what the extent
Of acres, less or more.
For his investment's safer far,
Than if in ships at sea,
Or funds in banks, with which now a'days,
Defaulters often flee.

And he is happy, though he toil,
For labor bringeth rest;
A blessing 'tis, when not o'ertasked,
And gives to all a zest.
He joys to see the fruits and grain
Perfected by his skill,
And harvest rich, all gathered up,
His bins and barns to fill.

Or who has health, if 'tis not he
Who rises with the sun?
With cheerfulness, and temperance too,
His daily task is done;
He loves the breath of scented fields,
Enjoys his own fire-side—
True pleasure rural life attends,
Till comes its closing tide.

Of his profession he may boast,
The first on earth we trace,
For the first man it was ordained
To culture earth's broad face.
Never look back, when to the plow
Once you have set your hand,
For many thus have rued the day,
They left their farm and land.

Boys' Corner.

A BOY'S LETTER ABOUT HIS TROUBLES.

WELL boys, here is something for you, written by one of your own number, and by one no older than yourselves, if you are not more than eleven years of age. We generally correct letters before putting them in type; but we are going to print this just as it is written, with all the spelling, capitals, punctuation marks, and good and bad grammar, exactly as it came to us. We do this, so that the writer, and all other boys, may be able to see the errors themselves.

They can also see how badly a wrongly-spelled word looks, and then we hope they will all try hard to learn to spell well. We will make an offer here. The boy, not more than twelve years old, who will write out this letter in a plain hand, and send it to us with all the mistakes corrected, and not get any one to help him in the least, shall have a copy of the *Agriculturist* sent to his name *free* for three months. Be careful to get no help from any one, and tell us that you have not.

We will put the letter in here, and say more about it next week, after you have read it. Be careful and keep this paper till then.

To the Editor of the American Agriculturist.

DEAR SIR:—I have been looking over the pages of your paper to find some directions to kill an insect that annoys my mother very much by destroying her plum trees, I found it; I was thinking how good it was I did find, and I wished you had a boys corner in your paper, if you had I should write and thank you for giving us so many valuable receipts and would ask you some other questions which perhaps you would not object to telling a fellow, I am a school boy just entering my teens, I have a pretty hard lot of it, I am obliged to study more than is necessary I know—if you please sir, I should like to know about your boy hood and how you managed to find out so much if you will consent to tell me and give this letter a place in the N. E. corner of your paper I shall like it, I am determined if possible to find out some way of getting hold of all I want to know without this everlasting studying, I do not wish to be a very great man what I mean by this is, I do not care one fig for going to Congress or writing poetry or the like of it; my father wishes me to become an honest upright business man—I have some taste for the fine arts but my father look upon these things as belonging to the feminine gender and does not wish me to give them any of my attention, my mother's taste is very different; although I say it myself I am not ashamed to own that I think my mother is a lady of good taste she would like me to understand all the fine arts and is grieved if my clothes or manners are out of order; she wishes me to see that my boots are well polished my nails and teeth in order at all times—my father pays attention to the solids, wishes me to have

good strong shoes my feet warm and dry pay for all I have and waste nothing, when I go to and from school carry one end of my trunk &c. I think you can guess out the rest of it, how I shall come out it is hard telling, my father has given me the offer of going to college if I choose but I don't think I shall choose to go I think I shall try to get on without it; if I do decide to go I shall have to get ready and if to get ready I must study more than I do now in all conscience I will not try it; I am sure it would kill me by inches and from all I can find out a college is only another name for a boarding school as far as study is concerned six of one and a half dozen of the other. I do not know sir how long a space I am taking up in your paper I can not tell in writing how much printing it will make for I never have seen any thing of mine in print and I can not guess how it will look but, I long to have it out—perhaps you will not put it the paper there will be so many mistakes about it, I generally have my compositions corrected, bad grammar spelling; orthography I believe they call it but this must go as it is as I shall not show it to one of the teachers, I would not let any one know that I had made an attempt of this kind for no money they would call an orthor or newspaper writer this I could not stand no how neither will I let you know my name, if my father and mother should find me out putting their caracer in print, I recon they would give me an additional chapter in Familiar Science a coat of many colors not very much like good old Joseph's but one of quite a different texture, as I am sure they would not like to have their caracters in any paper even the New-York Observer the ministers paper.

But now I must stop how to come to a *stopping* place I do not know I have never written to any one but my father and mother and then I wind up by saying your son I am not particularly fond of writing especially when they are to be inspected by the teachers and sometimes have two or three lines cut off because the Grammar is not good or something of the kind—please do not cut off any of this; let me have mistakes and all, and be sure and put an article in that the teachers will read about long lessons keeping a fellow studying to much and how your father managed you? and how old you were when you commenced getting up newspapers. I will see how it takes here and perhaps I will write you again. One of the teachers here says he has seen you and you are pretty good looking and good sized if so I think you did not have to study as much as we do, to be sure we look pretty well but it is owing to good air and *buck wheat cakes* these we have every morning when we are not tardy at prayers many is the time I have started for the chapel buttoning on my coat as I was going down stairs fearing I should have to breakfast on bread. The old cook who has served the establishment several years by sitting before a good coal fire and showing her science by browning cakes shows her ebony when she sees our zeal to be at prayers in time she likes punctuality in every thing, some how or rather I have got up some respect for her and have no doubt that the browning of the cakes have something to do with it.

A BOY FROM DOWN EAST.

A PRECOCIOUS YANKEE.—A lad was subpoenaed as witness in one of the American ports. The judge said, "Put the boy upon evidence." Upon hearing which Young America exclaimed, "Who are you calling boy?—I've chewed baccy these two years."

Youth, respect age, if you would in turn be respected.

Virtuous actions, sooner or later, will find their reward.

The best mode of revcnge, is not to imitate the injury.

Zealously strive to do good for the sake of the good.

Miscellaneous.

"LET ME SLEEP."

"Let me sleep," said my companion once, half pettishly turning from my touch. "Let me sleep." The words haunted my memory for hours afterwards. How often has the wish been breathed in this weary world, "O let me sleep."

The Man whose conscience lashes him for his misdeeds—evils committed and unrepented of, cries as he drops his head on his thorny pillow. "Let me sleep! with sleep comes oblivion." The mourner who has seen some bright and beautiful one fade from his embrace, like a summer flower nipped by a too early frost, bows his head over the prostrate form below him, and sighs in the agony of his soul, "Let me sleep—sleep with the loved ones whose smile shall never welcome my footsteps more."

"Let me sleep," says the traveller, who footsore and weary, has toiled long in this world, and seen hopes perished, unfulfilled joys wither ere they were tasted; friendship which he thought unduring changing in hue like the chameleon, and fading and melting into colorless air. "O let me sleep, for I am weary." The rosy-cheeked child, the bright-eyed maiden, the thoughtful matron, those for whom life puts on its finest aspects, its most endearing smiles all have periods in which they long for sleep, for the oblivion of all care; hours in which the waters of Lethe may flow darkly and deeply over them.

There cometh a sleep to all! a sleep deep, hushed, and breathless. The roar of the cannon, the deep-toned thunderbolt, the shock of an earthquake, or the rush of ten thousand armies cannot break up its still repose. With mute lips and folded arms, one after another take their places in the chambers of those palid slumberers; one after another, the ephemeral of earth, sink down into the grave and into the darkness of nothingness. No intruding footsteps shall jar upon their rest—no disturbing touch shall wring from them there the exclamation, "Let me sleep!"—*Exchange.*

LAUGHING.—Commend us to good, hearty laughter—one that explodes the vowels without "let or hindrance"—that rings the changes on the a, e, i, o, u, and y, and wakes the echoes if there be any asleep.

This may not be exactly according to D'Orsay; it may be decidedly vulgar; if so, it'll not be the first time diamonds have been found in the dust.

We just heard one of those good, wholesome laughs, and a hod-carrier was the author of it. Ten to one, he is an honest, generous fellow, who carries, besides, his heart about him, week-days and Sundays. It was no hollow, ghostly laugh, but a round, full, human explosion, with a body and soul to it; that one cannot help liking, whether he will or not.

A man may "smile and smile, and be a villain;" not so with your hearty laughter. But a simper, that diffuses a sickly moonlight over the face, and a chuckle that lodges in the throat and reddens the face, and shuts the eyes, are our abomination. We can abide a regular *Leather Stocking* laugh, that shakes the frame like an ague, and is only indulged in on special occasions. It is like a dinner for one—not social, to be sure, but then comfortable and enduring. It is contagious, withal, and altogether a luxury of a laugh, if one only knows how to enjoy it.

But the most musical of all things is the free, ringing laughter of childhood. No frost in it, no guile in it, it should be classed with the song of birds and the murmur of brooks. It "speaks the vacant mind"—not the thoughtless, but the care-free mind, before the heavy strings of this harp of life, are wound over and over for the graver, sadder notes of time.—*Exchange.*

POLITICIANS.—In his discourse upon *Polly-Tishuns*, Mr. Julius Cæsar Hannibal of the *N. Y. Picayune*, is very plain-spoken. He handles the subject without gloves, if his hands are black:

A polly-tishun hab no opinions ob his own; he am like a straw; hold him up, an' he'll p'int w'ich ebber way de wind ob pop'lar 'pinions blows him. Ef a platform breaks down, it don't hurt him, for he am like a cat dat allers lites on its feet; an' he runs rite up on anudder wun, an' hoorays as if he allers belong dere. 'Tween 'leshun times, he is quiet 'nuff, like an ole coon asleep in de top ob a holler tree, libin' on his fat; but, wen 'leshun kums, he gets lively, like frogs in spring. Den he gits a bank-note changed into sixpenses, purpus to spend for treats wid ebbery body. He wares an old hat, to look like a wurkin' man, an' he puts patches on his 'nees. He makes his arms sore, shakin' hands wid ebbery body, an' 'tends to be 'tickler anxious 'bout de helf ob your wife and children. He is as sly as a possum; see him wid a 'ligious man, an' he'll look an' talk like a minister in a camp-meetin'; meet him haf an 'our after, talkin' to sum wild feller, an' you'll hear wurds dat, ef dey ain't swearin', soun' very much like cussin'.

His natral home am de top ob a stump, an' he keeps to it so long sumtimes, dat he looks as ef he growed dar; and no doubt it would be a good t'ing ef he did. But he hates to get off it, 'kase w'en he cums down, he's no bigger dan odder pepil, and not a bit better, nuther. On it, he gits as noisy as a wind-mill, an' he's driv' by the same power—wind. W'en he tauks an' 'rites, he allers picks de longest words out ob de dick-shun-ary, to kiver up his ideas like wid a blanket; an' it 'pears as dough he was at pances to tuck de words in, under, an' all 'round his thoughts, so dat no wun can sec 'em, ef he's got enny, w'ich menny pepil dout—an' with good reason. Or, if ever he lets any idee 'pear, it's allers in sich a dress dat it may be 'splained to mean jist the contrary t'ing.

'Bout religion he never sez much, 'ceptin' dat men should be liberal in dere 'pinions, which he is hissef, for he goes to ebbery church in his neighborhood regular, and belices in 'em all alike.

W'en 'leshun's ober, he grows smarter in his 'pearance, don't ware ole hats enny more, an' puts on whole trowserloons. He berry offen gets uncommon short-sited after dis ewent, and can't see de frens dat was most useful in getting him offic. To be sure, dey deserve it, for 'sociatin' wid polly-tishuns, an' I don't pity 'em ef dey is forgot. Sumtimes, he can't eben 'member de promises he made 'fore 'leshun, an' ef he do, why 'suckumstances makes it impossible to kumply.

SERENADING.—*The Last Serenade*, from our friend Henry P. Leland, Esq., is a capital sketch; and will remind the reader of the old Quaker, who addressed the leader of a party that had been long serenading his handsome daughter, one pleasant night, without the slightest response from the dwelling, in these words: "Friend, thee has been singing of thy home, thy sweet home; now, if thee has so desirable a place, why doesn't thee go to thy home?" This argument was a clincher, and the serenading party departed.—*Knickerbocker.*

PHONOGRAPHIC.—Our S— (Jim) ought to go abroad and set up 'ritin' school. One day, Jim sent the teamster to O—, with an order for loading for his team, and directed him to return home the same day. The teamster was back in half the time allotted for the journey, and bolting into Jim's store, pushed the order in his face, and bawled out:

"What is that?"

"S—: (Taking the order and trying to read.) 'What's this? Why, that's your order.' (Holding it toward the teamster.)

"Wall, what on airth do'st say?"

"S—: (Reads, and spells, and studies, but

't is no go.) 'Henry, (the clerk in the store,) what was't I sent for?"

"Henry: 'Why, you sent for salt.'"

"Yes; there it is, as plain as day: (spells,)

"C-o-l-t—salt!"

"The teamster, being an uneducated man, sloped."—*Knickerbocker.*

"LITTLE BENNY."—So the simple headstone said. Why did my eyes fill? I never saw the little creature. I never looked in his laughing eye, or heard his merry shout, or listened for his tripping tread; I never pillowed his little head, or bore his little form, or smoothed his silky locks, or laved his dimpled limbs, or fed his cherry lips with dainty bits, or kissed his rosy cheek as he lay sleeping.

I did not see his eye grow dim, or his little hand drop powerless, or the dew of agony gather on his pale forehead; I stood not, with clasped hands and suspended breath, and watched the look that comes but once, flit over his cherub face. And yet, "Little Benny," my tears are falling; for somewhere I know there's an empty crib, a vacant chair, useless robes and toys, a desolate hearthstone, and a weeping mother.

"Little Benny."

It was all her full heart could utter; and it was enough. It tells the whole story.—*Fanny Fern.*

AGES OF EUROPEAN SOVEREIGNS.—The following are the ages of the principal reigning sovereigns:—Her Majesty Queen Victoria, 34; the King of Wurtemberg, 71; the King of the Belgians, 62; the King of Prussia, 57; the Emperor of Russia, 56; the King of Sweden and Norway, 53; the King of Denmark, 44; Louis Napoleon, 44; the King of the Two Sicilies and the King of Bavaria, 42; the King of Hanover, 33; the Sultan, 30; the Emperor of Austria, 23; the Pope, 60.

THE English Language is composed of 15,734 words, of which 6,732 are from the Latin, 4,312 from the French, 1,665 from the Saxon, 168 from the Greek, 691 from the Dutch, 211 from the Italian, 106 from the German, (not including verbs,) 90 from the Welsh, 75 from the Danish, 56 from the Spanish, 50 from the Icelandic, 34 from the Swedish, 31 from the Gothic, 16 from the Hebrew, 15 from the Teutonic, and the remainder from the Arabic, Syriae, Turkish, Portuguese, Irish, Scotch, and other languages.

NOTHING sets so wide a mark between a vulgar and a noble soul, as the respect and reverential love of the woman-kind. A man who is always sneering at woman is generally a coarse profligate or a coarser bigot.

RECIPES.

"BIRD'S NEST" PUDDING.—Take eight or ten pleasant apples, and dig out the cores, leaving them whole. Prepare a custard, six eggs to a quart, flavor with lemon, orange, or nutmeg, and a little salt, and when the apples are laid in a pudding-dish, pour the custard over them, and bake half an hour.

A BOILED APPLE PUDDING.—Boil dried apples nearly done. Save a tea-cup of the juice of the apple, for a sauce. Chop them, and mix with soaked bread, and boil in a bag. Make a sauce of melted butter, sugar, and flour, with enough of the apple juice to give it the flavor of wine, and spice with nutmeg. It is excellent.

TAPIOCA PUDDING.—To one pint of water, add a tea-cup of tapioca, and soak over night. In the morning add two beaten eggs, three pints of milk, and bake as any other. Another. Half a pint of tapioca dissolved in a quart of milk, while boiling. Add six eggs when nearly cold, with nutmeg, or cinnamon. Bake ten or fifteen minutes.

In the early period of New-York, innkeepers were fined if an Indian was seen leaving their houses drunk; and the whole street was fined, if the right house could not be ascertained.

Rash oaths, kept or broken, often produce guilt.

HAVE you a lazy servant? Send him on an errand just before dinner if you want to see him move.

SPECIAL NOTICE TO ALL SUBSCRIBERS.

WE find that by using such good paper, our volume of 832 pages will be quite large to bind, and especially large for those who wish to stitch their paper together with an index, without being at the expense of binding. To obviate this, we have concluded to be at the expense and trouble of making out an extra index with No. 26, so as to form a complete volume of the first 26 numbers. The index for the next 26 numbers will be given at the end of the year, or with No. 52. This arrangement will make it convenient for all, as the 52 numbers can be stitched or bound in two volumes with an index for each, or in one volume with the double index at the close.

We hope all will preserve their numbers, for there are many single articles each of which will be worth the price of the volume, for future reference. When the paper arrives from the post-office, a good plan is to see that it is properly folded, and then pin or sew it through the middle and cut open the leaves. It is very easy to stitch 26 numbers together. To do this, arrange them in regular order, and with an awl punch several holes about one-fourth of an inch from the back, and through these run a strong thread two or three times with a darning-needle, and the work is done. We have scores of volumes of papers, pamphlets, and addresses, thus prepared, which serve all the purposes of a bound volume, and occupy less room in storing and carrying. We would, however, prefer to see volumes of agricultural papers neatly bound and laid upon the book-shelves or tables of farmers. They are much better and more appropriate ornaments, than gilded volumes of trashy magazines or novels.

Markets.

REMARKS.—The decline in Flour the past week, was from 25 to 37½ cts. per bbl.; Wheat has not fallen in the same proportion, owing to the scarcity of good samples. Corn has declined about 6 cts. per bushel. Pork is 50 cts. per bbl. less, Beef no change, Lard a little lower, Wool is steady.

Cotton has fallen from ⅔ to ½ cent per lb. the past week; no change in other southern products.

Money grows tighter and tighter. Most outsiders have had to pay since our last, from 12 to 20 per cent. We see no chance of a relief, till people stop their foolish speculations and large importations. No legitimate business can long stand such ruinous rates of interest. Stocks are lower of course.

The weather still continues extraordinarily cold for the season. Thermometer ranging from 20 to 24. Last year the willows and some small shrubs began to leave out on the 24th of March; we cannot tell when they will begin this year—certainly not till the weather moderates. From 200 to 300 miles north of us, we understand the snow is still deep upon the ground. This in a measure accounts for the severe cold, as the prevailing winds here for the past sixteen days have been northerly.

From the Mark Lane Express, March 13th.

REVIEW OF THE BRITISH CORN TRADE.

THOUGH war has not been actually declared, matters are fast progressing to a point to render this inevitable; and we appear to be on the eve of events calculated to produce great effects on the corn trade. The mere probability of supplies from the Black Sea being interfered with was, some months ago, looked upon as a serious affair; but, now that it has become known that further shipments from thence have been prohibited little or no excitement is produced thereby. Has the effect been anticipated? or is the existing apathy caused by the belief that the Emperor of Russia will when he finds England and France in earnest, give in? The dullness may perhaps be attributed partly to the high rates already current, and partly to the expectations still cherished that the war (if it should be entered upon) will prove of short duration. Speculation is thus kept in check; and, as supplies continue to reach us on a sufficiently extensive scale to satisfy the consumptive demand, the possible future is for the present lost sight of. Another circumstance—viz., the probability of money becoming tighter—is not without considerable influence; there is a decided unwillingness to encourage speculative investments, and, though there cannot be said to be any immediate pressure, we hear from time to time of forced sales. These have perhaps been more frequent and on a larger scale at Liverpool than elsewhere, owing to the arrivals from America having been heavier there, and importers having been enabled to realize without incurring actual loss, the goods having been purchased on the other of the Atlantic before the last rise.

After a careful consideration of our present position, we feel inclined to think that, however unwilling buyers may be to act, there is little prospect of any material reduction in quotations; and we should certainly not be surprised to witness a rally earlier than the existing state of things appears to promise.

The millers have for a considerable time past been working out of stock; the bakers have done the same, and the trade generally may be said to have confined themselves strictly to the hand-to-mouth system. This may do very well so long as all goes on smoothly; but, should circumstances occur of a nature to create the least uneasiness, there would be an immediate anxiety to provide for future contingencies; and who can say that—with this country on the eve of war with Russia, with such a deficient harvest as the last, and with consumption as great, if not greater, than was ever before known—uneasiness for the future may not arise?

The weather continues very favorable; the temperature has within the last few days undergone a considerable rise, and showers have fallen in different parts of the country. Rarely has a more auspicious season been experienced than the present for spring sowing; and the Lent corn has been committed in the soil in a highly satisfactory manner. The work is now drawing to a close, and warm showers would therefore prove of the utmost benefit.

In regard to the autumn-sown Wheat, the reports are rather contradictory. In some districts the plant is described as very healthy, whilst in others its aspect is badly spoken of; and we have heard of instances in which it has been deemed advisable to plow up the land, and re-sow the same with spring corn. It must, however, be recollected that a larger breadth than usual is under this crop; and a partial failure of the plant may, therefore, prove of little consequence.

The advices from Scotland and Ireland speak favorably of the progress made with all kinds of field labor, as well as in reference to the generally promising appearance of the Wheat plant. Potatoes seem to have held out much better in the sister isle than anticipated; and, though there can be no doubt that the Wheat crop was quite as unsatisfactory there as on this side of the channel, the superior yield of Potatoes and

Oats has enabled Ireland to manage thus far with very little assistance.

PRODUCE MARKETS.

Wholesale prices of the more important Vegetables, Fruits, &c., at the principle New-York Markets.

April 1, 1854.

VEGETABLES.—Potatoes, Western Reds, ⅔ bbl., \$2 25; Mercers, \$3 25; Junes, \$2 75; Carters, \$3 50; Merinos, \$2; Pinkeyes, \$2 12½; Turnips, white, ⅔ bbl., \$2; yellow, \$1 75; Onions white, ⅔ bbl., \$3; yellow, \$2 50; red, \$1 75; Carrots, ⅔ bbl., \$2; Parsneps, ⅔ bbl., \$1 75; Celery, ⅔ doz. bunches, \$1@2; Lettuce, ⅔ doz., 25c.@\$1; Beets, ⅔ bbl., \$1 75; Cabbage, ⅔ hundred, \$8@10; Spinach ⅔ bbl., \$4.

FRUITS.—Apples, Greenings, ⅔ bbl., \$3 50; Spitzenburgs, ⅔ bbl., \$3 50; Russets, ⅔ bbl., \$3 50; Northern Spy, (very few in market), ⅔ bbl., \$4. Second quality of the kinds above mentioned are worth from \$2@2 50; Cranberries, ⅔ bbl., \$9@10, and very scarce; Maple Sugar, per lb. 12½c. Eggs per doz., 16c.; butter, 15c. and 20c. per pound.

There is large quantities of ordinary butter in market, and the sales are rather dull, though a prime article is in demand.

The markets are generally dull at present, and but little of the first quality of produce on hand. The cold weather of the past week injured large quantities of produce coming to market.

NEW-YORK CATTLE MARKET.

Monday, April 3, 1854.

WE notice considerable increase in numbers above last week's reports; and the cattle average much better than they have for a long time before. On this account the prices do not range as high as they were last week. The market opened this morning quite brisk, but commenced falling off shortly after noon.

Lowest price, 7c.; Middling, 8c.; Beet, 9c. Some very extra sold for 11c.

Washington Yards, Forty-fourth street.

A. M. ALLERTON, Proprietor.

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY
Beeves, 2,978	2,790
Cows, 44	
Sheep, 738	
Swine, 1,171	
Veals, 635	

Of these there were forwarded by the Harlem Railroad, beeves, 156; cows, 44; sheep, 544; calves, 635.

By the Hudson River railroad, beeves, 1,650; sheep, 194.

By the Erie railroad, beeves, 1,100; swine, 1,171.

New-York State, furnished by cars, 232.

Ohio, by cars, 1,169; on foot, 145.

Pennsylvania, on foot, 299.

Kentucky, by cars, 486.

Illinois, by cars, 84.

Mr. ALLERTON reports the following prices: Swine, corn fed, 5½c., and those not fed on corn 5¼c. per pound; Sheep, \$4@57 per head. By the pound, live weight, gross 6c.; dead, 11c.; Cows, \$30@50, according to quality.

CHAMBERLIN'S, Robinson street.

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY.
Beeves, 212	
Cows and Calves, 25	19
Sheep, 2,000	600
Veals, 25	

BROWNING'S, Sixth etreet.

Beeves, 363	
Cows, 93	
Sheep, 1,748	600

O'BRIEN'S, Sixth etreet.

Beeves, 40	
Cows, 100	

Mr. CHAMBERLIN reports the following prices at Robinson Street Market: Cattle \$7 50@11 per hundred; Cows \$25 @35@50; Sheep, per head, \$3 50@5@7; Extra, \$10; Veals, per pound, 5@6 and 7c. He reports the markets as quite brisk and their numbers all sold.

SHEEP.—Sales of sheep at CHAMBERLIN'S, Hudson River, Bull's Head, Robinson Street, for the week ending April 3, by JOHN MORTIMORE.

Sheep.	Average per head.	Per pound.
153	\$4 87½	17c.
77	5 00	12c.
108	6 25	12c.
148	5 37½	12½c.
170	6 12½	13c.
296	5 25½	12½c.

The supply this week has been less than any week of the season, and consequently the advance in price, which is from 1½ to 2 cents above last week's quotations, and the demand still good.

The week closes with but few sheep on hand, and the demand good. Mutton is selling at Washington Market by the carcass from 7 to 9½ cents per pound. Pork 6½ cents per pound. Beef 8 cents per pound.

ADVERTISEMENTS.

Advertisements for the American Agriculturist must be paid for in advance.

NEW AND CHOICE FRUITS.

Hovey & Co., No. 7 Merchants Row, Boston
 have the pleasure of offering to amateur cultivators and the trade generally, the following superior new fruits, of which they possess the entire stock, and are now first offered for sale:

BOSTON PEAR.

A new native summer variety, ripening from the middle to last of August, just before the Bartlett, of large size, with a beautiful waxen yellow skin, and a red cheek, superior to any variety of its season.

This fine pear was first exhibited by Messrs. Hovey & Co. before the Mass. Hort. Soc. in 1849, and repeatedly since that time, obtaining the highest commendation of the Fruit Committee, who have spoken of it as follows:

"From Hovey & Co. a new native pear, of good size, fair and handsome, of a brisk vinous flavor, fully equal to an Urbaniste in its best condition, and one of the finest early pears."—Report of Aug. 1850.

"The Messrs. H. & Co. have also presented this season a native variety of great beauty and of fine quality, which promises to rank among the best of our early pears."—Hon. M. P. Wilder, in the Horticulturist, 1851.

In 1850, the Mass. Hort. Soc. awarded Messrs. H. & Co. the premium to the variety, as the best summer pear.

In 1853, the Mass. Hort. Soc. awarded Messrs. H. & Co. a gratuity of \$20 for the introduction of this variety.

Fine trees of large size, 5 feet high, will be ready for sale on the 1st of April next, at \$5 each. A few trees of very large size, full of flower-buds, \$10 each.

HOVEY CHERRY.

This new and superb Cherry was raised from seed by Messrs. H. & Co., and is one of the largest and most beautiful cherries known. It measures more than an inch in diameter, and is produced in clusters of twenty or thirty cherries each. The color is amber, beautifully shaded with deep coral red. The flesh is firm, sweet and rich, ripening the last of July and beginning of August. It is beautifully figured in the Fruits of America. It first fruited in 1848, and has obtained the following commendatory notice:

"One of the best, if not the very best new cherries tasted the past season, 1851, was a seedling of Messrs. Hovey. It was of the largest size, sweet, high flavored, and very fine. The present indications are that it will take a high rank, and become an established favorite."—Mr. Cabot's Report, 1851.

"On the 17th July, Messrs. H. & Co. produced their Seedling Cherry, mentioned in the preceding report. This, notwithstanding the unfavorable season, fully maintained the high character then awarded to it."—Report of Fruit Committee, 1853.

The committee awarded Messrs. Hovey & Co. the APPLETON GOLD MEDAL for this variety, it having proved, for five consecutive years, a new and superior cherry.

Young and handsome trees of this superior cherry will be ready for sale the 1st of April next, at \$3 each.

CONCORD GRAPE.

MR. BULL'S NEW AND SUPERIOR SEEDLING.

This remarkably fine American variety is the greatest acquisition which has ever yet been made to our hardy grapes, and supplies the desideratum so long wanted, of a superior table grape, sufficiently hardy to withstand the coldest climate, and early enough to ripen its fruit in any part of the Northern or New-England States. It is four weeks earlier than the Isabella, and two weeks earlier than the Diana. It was fully ripe the last season (1853) on the 2d of September, when Messrs. Hovey & Co. exhibited specimens from Mr. Bull's original vine before the Massachusetts Horticultural Society.

It is a most vigorous growing vine, perfectly hardy, with bunches of large size, handsomely shouldered, often weighing a pound, and with large roundish oval berries, frequently measuring an inch in diameter; color very dark, covered with a thick blue bloom; flesh free from all pulp; flavor very rich and luscious, with a fine sprightly aroma. The foliage is large, broad, and thick, and the berries have never been known to mildew, rot, or drop off under any circumstances, during the five years since it has borne fruit. All good judges who have tasted it pronounce it far superior to the Isabella in its ripest conditions.

Opinions of the Fruit Committee of the Mass. Hort. Soc. 1852, Sept. "Seedling grape from E. W. Bull; large, handsome, and excellent."

1853, Sept. "Fully equal to specimens last year, and proves to be a remarkably early, handsome, and very superior grape."

Fine strong one-year old vines will be ready for sale April 1, at \$5 each, and to the trade, at \$40 per doz. All orders will be attended to in the rotation in which they are received.

PREMIUM SWINE.—SUFFOLKS FROM MORTON'S PIG-
 gery have taken the highest premiums, as may be seen by the published Transactions of the Massachusetts State and Norfolk County Agricultural Societies. The stock now for sale is large and well assorted, embracing the purest and best blood of this unequalled breed. Pairs properly paired for breeding, \$30 a pair. For prices of Boars and Sows, see catalogue, which will be sent by mail on application. Animals purchased forwarded by Express

GARDEN SEEDS.

A GENERAL LIST OF FRESH GARDEN SEEDS, imported and raised for R. L. ALLEN, 189 and 191 Water street.

PEAS.—Early May, Prince Albert, Early Warwick, Early Washington or June, Early Frame or June, Early Charlton, Early Emperor, Bishops Early Dwarf, Dwarf Sugar, Dwarf Blue Imperial, Blue Russian, Fairbairn's Champion of England, Large White Marrowfat, Black Eyed Marrowfat, and all of Knight's different varieties.

SALE OF STOCK.

PURE BRED STOCK AT PRIVATE SALE AT MOUNT FORDHAM, WESTCHESTER CO., NEW-YORK, ELEVEN MILES FROM CITY HALL, N. Y. By Harlan Railroad Cars.

Having met with more success than I anticipated the past year, with the Catalogue of male animals at Private sale, is the reason for offering this lot of animals, AND MY JUNE SALE BY AUCTION, WILL NOT TAKE PLACE. A full descriptive Catalogue with prices attached, will be published on the fifteenth of April, and I intend to be at home myself to see any who may call. I will sell at private sale, about 18 Short-Horns, 6 of which are young Bulls and Bull Calves. The Cows and Heifers old enough will be in Calf to the Celebrated Imported Bull "BALCO" (9018) or Imported, "ROMEO," winner of the first Prize at Saratoga, in 1853; and also at American Institute the same year.

The young Bulls and Bull Calves, are some of them from imported Cows, and sired in England; and others are sired by the imported Marquis of Carrabas, (11789), winner of the first Prize at Saratoga, the past year, as a two year old.

Also, about 10 head of Devons, consisting of a yearling Bull, sired by MAJOR, and 5 Bull Calves, sired by my imported first Prize Bull, FRANK QUARTLY, and several of them from imported Cows and Heifers old enough, will be in Calf to FRANK QUARTLY. Also 6 or 8 Suffolk Sows; and several young Suffolk and Essex Boars. Also, 2 South-down Rams, imported direct from Jonas Webb; and 6 Yearling Rams, all bred by me, from Stock on both sides, imported from Jonas Webb. Catalogues will be forwarded by Mail if desired.

All Animals delivered on SHIPBOARD, or RAIL CAR in the City of New-York, free of expense to the purchaser. The Devons are at my Herdsdale Farm, 12 miles north, to which place I will take persons both to and from.

MY FRIEND MR. N. J. BECAR, who is interested in several of my Importations, will also sell about 10 head of Short-Horns, consisting of 4 young Bulls, and 5 or 6 Females. His young Bulls are also several of them from imported Cows, and sired by the LORD OF ERYTHOLAND, (2236), and the celebrated first Prize Imported Bull ROMEO. Mr. Becar's Cows and Heifers are in Calf to the imported Bull, MARQUIS OF CARRABAS, (2789). Mr. Becar can be seen at his Store, No. 187 Broadway, New-York, at which place he will make arrangements to go to his Farm, at Smithtown, Long Island. His animals will be entered in the same Catalogue with mine, which can be obtained by addressing him at his Store, or me at Mount Fordham. His animals will be delivered in the same manner as mine. Our Importations have been in almost all cases made at the same time, and are of equal merit, excepting that I have more in number.

L. G. MORRIS.

TERMS, Cash on delivery. 29-37

CHARTER OAK GRAPES.

NOTICE.—THE UNDERSIGNED WISHES TO DIRECT particular attention to these magnificent grapes, which he has propagated with such success, that they are beyond comparison the largest grapes known. He has many one and a half inches in diameter. The grape is perfectly hardy, and will endure the winter, and ripen 2 or 3 weeks sooner than the Isabella or Catawba. The Charter Oak Grape is unsurpassed for preserving and for wine, and a delicious table fruit. Orders up to 1st May received by subscriber, at 5 Seammel street, New-York city. After that date at Frankfort, N.Y. [27] JOHN P. WILSON.

MORRIS FEMALE INSTITUTE.

THIS INSTITUTION IS SITUATED AT MORRISTOWN, N. J., about an hour and a half ride from the city of New-York, on the Morris and Essex railroad; the cars leaving New-York several times a day. It has been ably patronized for the last six years. There will be a vacancy for a few more pupils in April.

Faithful teachers are provided for English branches usually required; also Drawing and Painting. French, Latin, and Spanish under a native teacher.

Vocal and instrumental music by an accomplished player, whose time and attention has been for years devoted exclusively to this object.

Further particulars, and circulars, may be obtained by applying to J. A. SEELEY, Principal, or at the book-store of Messrs. C. Shepard & Co., 152 Fulton street, near Broadway, or at this office.

Persons wishing to send their daughters from home, would do well to visit this Institution before deciding. 27-41

FRESH GARDEN SEEDS OF ALL THE BEST VARIETIES. Also a choice collection of GREEN-HOUSE and GARDEN PLANTS, FLOWER ROOTS, &c. For sale at A. BRIDGEMAN'S HORTICULTURAL ESTABLISHMENT, Nos. 874 & 875 Broadway, above 18th street, New-York. [28] Garden & Greenhouses, Astoria, L. I. 26-38

WILLARD FELT, NO. 191 PEARL STREET, (NEAR Maiden Lane.) Manufacturer of Blank Books, and Importer and Dealer in Paper and Stationery of every description. Particular attention paid to orders 26-77

Orders from any distance promptly attended to. Address, WM. IDA Y, 26-47 Morristown, Morris Co., N. J.

ASSISTANT EDITOR WANTED.

THE PUBLISHERS OF A STANDARD AGRICULTURAL Journal wish to secure the services of a young man who has had experience on the farm and in the garden, and who is capable of assisting in the office duties of a paper, such as writing and preparing articles, correcting proof, answering correspondence, &c. To such a man there is a fine field open, both for self-improvement and for rising in the editorial profession. The place is a good one for a young man who has just completed a collegiate course, provided he has had sufficient farm experience to qualify him for an accurate observer and writer on agricultural subjects. Salary first year moderate. For further information address ALEXANDER, to the care of the editors of the American Agriculturist, New-York, stating age and experience, and sending articles of composition if he has written any for the press. Communications on this subject will be considered strictly confidential. 25-27

NO. 1 SUPERPHOSPHATE OF LIME.—THIS VALUABLE fertilizer has been used for several years in England and other parts of Europe, and, next to Guano, holds the highest rank in popularity, and the extent to which it is used among farmers. Its introduction in this country has been more recent; but the progress it has made in the estimation of the public has not been less marked or successful than abroad. It is now extensively used throughout the Northern States, after a full trial and investigation of its merits; and it is rapidly becoming, like its predecessor, Guano, a favorite manure at the South and West.

It is composed of crushed or ground bones, decomposed by the addition of about one fifth their weight of sulphuric acid, diluted with water, to which is added a due proportion of guano and sulphate of ammonia. The latter is the active and one of the most efficient agents in the best Peruvian Guano.

It is suited to any soil in which there is not already a full supply of the phosphates, which is seldom the case. All crops are benefited by its application.

For sale in large or small quantities, in bags of 150 lbs. each. No charge for packages. All bags will be branded "C. B. De Burgo, No. 1 Superphosphate of Lime."

PERUVIAN GUANO of best quality.

AGRICULTURAL AND HORTICULTURAL IMPLEMENTS of all kinds.

FIELD AND GARDEN SEEDS, of various sorts, fresh home grown and imported.

THE AMERICAN AGRICULTURIST—weekly, \$1 per volume—two volumes a year.

For sale at R. L. ALLEN'S Agricultural Warehouse and seed Store, 189 and 191 Water street, New-York. 25-tf

FOR SALE AT THE SOUTH NORWALK NURSERY, THE Great New Rochelle or Lawton Blackberry Plants; also plants of the White fruited Blackberry. For sale also a large stock of small plants of the new or North River Red Antwerp plants, at the low price of five dollars per thousand. The above plants all warranted.

GEORGE SEYMOUR & CO., South Norwalk Nursery, Conn. 24-36

ATKINS' SELF-RAKING REAPER.—40 of these machines were used last harvest in grass or grain or both, with almost uniformly good success, in nine different States and Canada. TWENTY-SIX PREMIUMS, including two at the Crystal Palace, (silver and bronze medals,) were awarded it at the autumn exhibitions. I am building only 300, which are being rapidly ordered. Mr. Joseph Hall, Rochester, N. Y., will also build a few. Early orders necessary to insure a reaper.

Price at Chicago \$175—\$75 Cash with order, note for \$50, payable when reaper works successfully, and another for \$50, payable 1st December next with interest. Or \$160 cash in advance. Warranted to be a good Self-Raking Reaper.

Agents properly recommended, wanted throughout the country. Experienced agents preferred. It is important this year to have the machines widely scattered.

Descriptive circulars with cuts, and giving impartially the difficulties as well as successes of the reaper, mailed to post-paid applications. J. S. WRIGHT, "Prairie Farmer" Warehouses, Chicago, Feb. 1854. 23-35

POUDRETTE.

THE LODI MANUFACTURING COMPANY OFFER their Poudrette for sale in lots to suit purchasers, from a single barrel up to 4000 barrels, at their usual rates, \$1 50 per barrel for any quantity over seven barrels, delivered on board of vessel in the city of N. York, free of cartage or other charge. When 200 or 300 barrels are taken, a deduction will be made from the above price. That this article has stood the test of fourteen years trial is proof of its efficacy. It is the cheapest and best manure for corn ever produced, and it has the advantage of being useful in small quantities and harmless in large. It is a capital manure for peas, strawberries, &c., and all garden vegetables. Apply by letter or personally to the Lodi Manufacturing Company, 74 Cortlandt st., New-York. 22-34

GARDENER FOR THE GREEN-HOUSE AND GRAPE-HOUSE.—Wanted a Gardener as above, who is experienced in the management of the Green and Grape House in the United States. None need apply except fully qualified. 22-tf A. B. ALLEN, 189 Water st.

EARLY EXCELSIOR POTATOES.—THIS IS A NEW AND very superior sort. They are as early as the June potatoes, grow above the average size, are mealy and palatable, and have kept better than any other variety planted in this vicinity. The rot has never been known among them. 23-tf R. L. ALLEN, 189 & 191 Water st., N. Y.

GARDEN IMPLEMENTS.

HEDGE, LONG-HANDLE, AND SLIDING PRUNING SHEARS.—Budding and Edging Knives; Pruning Hatchets, saws and knives; pruning, vine and flower scissors; bill and Milton hooks; lawn and garden rakes; garden scufflers; hoes of great variety, shovels and spades; hand engines, which throw water forty feet or more, syringes and water pots; grafting chisels, tree scrapers, and caterpillar brushes; transplanting trowels, reels; hand plow and cultivator, very useful to work between rows of vegetables, together with a large assortment of other implements too numerous to mention. [21tf] R. L. ALLEN, 189 and 191 Water-st.

MEN AND BOYS' CLOTHING, AT WHOLESALE AND Retail—cheaper than ever, at J. VANDERBILT'S, No. 81 Fulton street, New-York. A very large assortment of all qualities and sizes; also a splendid assortment of fashionable goods, which will be made to order in a style that cannot be surpassed. Also India rubber clothing and furnishing goods. Your patronage is respectfully solicited. 2-30 J. VANDERBILT, 81 Fulton street.

AGRICULTURAL IMPLEMENTS.

AGRICULTURAL IMPLEMENTS.—THE SUBSCRIBER keeps constantly on hand, and offers for sale the following valuable implements:

Fan Mills of various kinds, for rice as well as wheat, rye, &c. Grain Drills, a machine which every large grain planter should possess. They are of the best patterns, embracing most valuable improvements.

Smut Machines, Pilkington's, the most approved for general use.

Hay and Cotton Presses—Bullock's progressive power-presses, combining improvements which make them by far the best in use.

Grain mills, corn and cob crushers, a very large assortment of the best and latest improved kinds.

Horse Powers of all kinds, guaranteed the best in the United States. These embrace—1st. The Chain Power, of my own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, and economy. They are universally approved wherever they have been tried. 2d. The Bogardus power, for one to four horses. These are compact, and wholly of iron, and adapted to all kinds of work. 3d. Edy's Circular Wrought Iron Power, large cog-wheels, one to six horses, a new and favorite power. 4th. Trimble's Iron-Sweep Power, for one to four horses. 5th. Warren's Iron-Sweep Power, for one or two horses.

GRAIN MILLS, STEEL AND CAST IRON MILLS, AT \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES.—FOR MAKING DRAINING TILES OF all descriptions and sizes.

WATER RAMS, SUCTION, FORCE, AND ENDLESS-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL KINDS, MADE EXPRESSLY for the California and Oregon Markets.

DRAINING TILES OF ALL FORMS AND SIZES.

CLOVER AND TIMOTHY SEED HARVESTER.—A newly-patented machine, will harvest 10 or 12 acres per day with one horse.

HAY AND COTTON PRESSES.—BULLOCK'S PROGRESSIVE Power Presses, combining improvements which make them by far the best in use.

THRESHERS AND FANNING-MILLS COMBINED.—OF Three Sizes and Prices, requiring from two to eight horses to drive them, with corresponding horse powers. These are the latest improved patterns in the United States.

SOUTHERN PLOWS.—Nos. 10 1/4, 11 1/4, 12 1/2, 14, 15, 18, 18 1/2, 19, 19 1/2, 20, A. 1, A. 2, 50, 60, and all other sizes.

CORN-SHELLERS, HAY, STRAW, AND STALK-CUTTERS, Fanning-Mills, &c., of all sizes. R. L. ALLEN, 189 and 191 Water street. 1-tf

REES & HOYT, PREMIUM PATENT RIVETED STRETCH-ed Leather Band Manufacturers, 37 Spruce street, New York. 3-29

FERTILIZERS.

PERUVIAN GUANO.—First quality of Fresh Peruvian Guano, just received in store. R. L. ALLEN, 189 and 191 Water st., N.Y.

SUPERPHOSPHATE OF LIME, OR CHEMICAL MANURE.—100 tons Paterson's Improved, skillfully made of the best materials, and for sale at lowest rates, by HASKELL, MERRICK & BULL, Importers of Artificial Manures, Wholesale Agents for the Manufacturer, No. 10 Gold street. 1-31

HORSE MARKETS.

AMOS SMITH, SALE AND EXCHANGE STABLE, No. 76 East Twenty-fourth street, New-York. 1-27

BULL'S HEAD SALE AND EXCHANGE STABLES, TWEN-ty-fourth street, West side of Third Avenue, N. Y. 1-34 A. S. CHAMBERLIN, Proprietor.

FAGAN & GRAHAM, SALE AND EXCHANGE STABLES, cor. Lexington Ave. and Twenty-fourth street, New-York. F. & G. have at all times on hand the most select stock of Messenger and Abdalla horses, together with good draught horses. Horses at livery by the day, week, and month. 1-38

HAIR RESTORERS, &c.

BARKER'S CHEVEUXTONIQUE.—THIS IS AN ENTIRELY new article, concocted for the purpose of Preserving, Restoring, and Beautifying the Hair, and unlike most preparations designed for the same objects, it is free from all greases, so that its application cannot soil the most delicate fabric. As an eradicator of Dandruff, it is unequalled, while its infallibility in cases of headache, easing the most violent in a few moments, cannot fail to commend it to universal appreciation. The Cheveux-tonique is for sale by all the respectable druggists and fancy stores throughout the city. The depot for its sale, wholesale and retail, is at BARKER'S Ladies' Hair-dressing Establishment, No. 439 Broadway. 2-48

HORTICULTURAL.

ISABELLA GRAPE VINES.

OF PROPER AGE FOR FORMING VINEYARDS, CULTI-vated from, and containing all the good qualities which the most improved cultivation for over fourteen years has conferred on the Croton Point Vineyards, are offered to the public. Those who may purchase will receive such instructions for four years, as will enable them to cultivate the grape with entire success, provided their locality is not too far north. All communications addressed to R. T. UNDERHILL, M. D., New-York, or Croton Point, Westchester Co., N. Y., will receive attention. The additional experience of two past seasons, give him full assurance that by improved cultivation, pruning, &c., a crop of good fruit can be obtained every year, in most of the northern, and all the middle, western, and southern States.

N. B. To those who take sufficient to plant four acres, as he directs, he will, when they commence bearing, furnish the owner with one of his vine-dressers whom he has instructed in his own mode of cultivation; and he will do all the labor of the vineyard, and insure the most perfect success. The only charge a reasonable compensation for the labor. 28-31. R. T. U.

FRUIT AND ORNAMENTAL TREES AND PLANTS.—Including every thing necessary to the Garden, Green-house, Nursery, and Orchard, with all the recent introductions, at very low rates. Descriptive price Catalogues gratis. Carriage paid to New-York. Ornamental and other planting done in any part of the country. The best season for transplanting is after Oct. 10. Address B. M. WATSON, Old Colony Nurseries, Plymouth, Mass. 8-59

WACHUSETT GARDEN AND NURSERIES.

NEW-BEDFORD, MASS., ANTHONY & MCAFEE, PRO-PRIETORS. Successors to Henry H. Crapo, would invite the attention of the public to their extensive stock of Fruit and Ornamental Trees, Flowering Shrubs, Rose Bushes, &c. Evergreens, Balsam Firs, American and Chinese Arbor Vitae, Cedrus Deodara,

Cryptomeria Japonica, Norway Spruce, Yew Trees, Tree Box, &c., an extensive assortment of Apple, Pear, Plum, Cherry, Peach and Apricot Trees.

The stock of Pear Trees is very large, both on Pear and Portugal Quince Stocks, embracing every thing worthy of cultivation. All our Pear Trees are propagated and grown by ourselves.

WARRANTED TRUE TO NAME. The soil, climate, &c., of this locality being so favorable to the Pear, our trees are unrivalled for HEALTH, vigor of growth, &c., &c.

They are all free from that destructive malady THE PEAR BLIGHT, which has never existed in this locality. Prices low, and a liberal discount to the trade. New- Bedford, Jan. 1st, 1854. 17-68

HOUSE-FURNISHING.

CHIMNEY TOPS, MADE BY THE GARNKIRK COMPANY. Encaustic Tiles for floors, Vases and Statuary for lawns and gardens, &c. for sale by MILLER, COATES & YOUNG, 279 Pearl street. 2-32

IRON BEDSTEADS VS. BEDBUGS!—500 IRON BEDSTEADS, which fold to occupy the space of a chair. 500 Iron Settees, proof against Yankees' knives. Iron Chairs, Iron Hat Stands, and all kinds of Ornamental Iron Furniture, bronzed in a most beautiful manner. All kinds of Iron Fence and Verandah Work, made at very low rates. G. MAURER, Manufacturer, 178 William street, between Beekman and Spruce, N. Y. 2-36

HOUSE FURNISHING AND MECHANICS' HARD-ware.—M. DA COSTA & CO. offer for sale all articles in the above line cheap for cash. All articles warranted, exchanged or taken back. No. 206 Chatham street, opposite Division street, N. Y. 6-31

LIVERY STABLES.

NORTHUP & POST'S DROVE AND SALE STABLES, corner of Third Avenue and Twenty-fourth street, New-York. The subscribers, formerly proprietors of the Rose Hill Stables, respectfully announce to their former patrons and the public generally, that they have taken the five new fire-proof brick stables, capable of holding 300 horses, directly opposite the Bull's Head Hotel, and, by their efforts to please, hope to receive a fair share of that patronage which they so strongly solicit. R. K. NORTHUP, New-York, April 1st, 1853. N. POST.

N. B.—New wagons and harness for the accommodation of their customers. 1-34th

CONCKLIN & HUGG, LIVERY STABLES, NOS. 63 & 65 Twenty-fourth street, between Lexington and Third Avenues, office on Twenty-fourth street, New-York.—Coaches, Light Wagons, and Horses to let on most reasonable terms. Horses kept by the day, week, or month. 1-40

FRENCH BURN, ESOPUS AND COLOGNE MILL-STONES, Mill Irons and Machinery of every description, at the Columbian Foundry, 45 Duane street. 1-26

MACHINERY, PATENTS, &c.

IRON AND STEEL.—SANDERSON BROTHERS & CO. Sheffield, warranted Cast Steel. New-York, E. F. Sanderson, 16 Cliff street. Boston, J. B. Taft, 21 Doane street. Philadelphia, E. Frith, 42 Commerce street. New-Orleans, A. Robb, 24 Bank Place. 2-43

MANUFACTURES.

RANGES AND HEATERS.—I AM NOW PREPARED TO supply those in want of a Cooking Range with one that is not only economical, but combines more conveniences for boiling, baking, &c., than any other in use. Also, the Etna Heater, for warming houses of any size. Apply to A. McPHERSON, No. 393 1/2 Water street. 2-40

FISH HOOKS AND FISHING TACKLE, NEEDLES, &c.—HENRY WILLSHER, Manufacturer and Importer of Needles, Fish-hooks and Fishing-tackle, consisting of Limerick and Kirby salmon, trout, bass, pike, perch and other Hooks; Salmon, Lake, and Trout Hooks; Cork and Wood Floats; Flax Twisted and Plaited Silk, Chinese Grass Hair, and Cable-laid Lines; Bowed, Swivel, Hollow, and Plain Sinkers; Flax and Silk Lines ready for use; Silk-worm Gut; Snells; Double Twist, and Single Gut Leaders; Spoon Bait; Squids; Multiplying and Plain Reels, Nets, Artificial Fish; Walking-cane and other Rods; Lolley's and Chambers' Sail Needles; Pack and Willshe's superior Sharps and Between Needles, &c. Cheap for cash, in lots to suit purchasers, at No. 9 Cedar street, New-York. N. B.—Orders per mail or otherwise promptly attended to. 2-40

MISCELLANEOUS.

GREENWICH POTTERY, 261 WEST EIGHTEENTH street. Steam-pressed Vitreous Drain Pipe, from three to eighteen inches in diameter, and in two feet lengths. The best and cheapest medium for drainage and sewerage ever yet offered to the public. The subscriber is the exclusive manufacturer of steam-pressed Drain Pipe in this country, and he offers it to the public on as favorable terms as the ordinary drain pipe made or sold in this city. 2-27 WASHINGTON SMITH.

WHOLESALE FISH STORE.—500 BBL. SALMON, 2000 bbls. Mackerel, first quality, 3000 Small Packages Mackerel, 200 bbls. New Shad, 500 half Shad, 1000 bbls. New Herring, 300 half New Herring, 1000 quintals New-Dried Cod-fish, 500 Jars New Anchovies, 500 Kegs New Dutch Herring, 2000 Boxes New Smoked Herring, 3000 lbs. New Smoked Salmon, 500 Kibbs New Soused Salmon, 500 Kegs New Spiced Herring, Sword-Fish, Blue-Fish, Pickled Cod, Haddock, Halibut, White-Fish, Sturgeon, Trout, Dun-Fish, &c.

For sale by NELSON WELLS & CO., 81 Day street, between Washington and West, May 13th, 1852. 1-52 S. H. WOOD.

SEEDS.

SEEDS.—TIMOTHY; RED AND WHITE CLOVER; BLUE Grass; Orchard Grass; Bay Grass; Red Top; Sugar Corn; Peas; Beans; Turnip; Cabbage; Beet; Lettuce; Onions; Radish; Squash; Orange; Large Yellow Locust, and all other kinds of field and garden seeds. Also Rhubarb Roots; Asparagus Plants, &c. R. L. ALLEN, and 191 Water street.

STOCK.

IMPROVED STOCK OF ALL KINDS.—HAVING HAD great experience in breeding and rearing fine stock for the past twenty years, I offer my services to my friends to procure it of the best and most reliable kinds. As much notice as convenient is at all times desirable previous to purchasing, as it takes time to make good selections. Early in August or September is the best time to purchase for the South.

Short Horn or Durham cattle, Devons, Herefords, Alderney or Jersey and Ayrshires. Long-wooled Sheep—the Cotswold, Oxford, Leicester, Bakewell, and Lincoln. Mutton Sheep—the Southdown. Fine-wooled Sheep—such as the Saxon, Spanish, and French Merino.

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, which are spurious. 1-tf A. B. ALLEN, Nos. 189 and 191 Water street.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master, and ask him to mark the envelope, *Registered by —, P. M.*

BACK NUMBERS are usually kept on hand, and when a subscription is sent without naming any date for commencing, the back numbers from the beginning of the current volume will be sent, unless as sometimes happens, an unusual rush of subscribers has exhausted the supply.

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In writing, always give the Post-office (instead of the town) and the County and State. *Write these very plainly.*

Clubs may add to their number at the same rate per copy as was paid by the original members.

Those wishing their papers changed from one office to another, should give the name, county, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished with Harper's Magazine, one year for	\$4 00
" Putnam's do do - - - -	4 00
" Knickerbocker do - - - -	4 00
" Eclectic do do - - - -	6 00
" Little's Living Age do - - - -	6 00
" National Magazine do - - - -	3 50
" Dickens's Household Words do - - - -	3 50

Address ALLEN & CO.,

J. A. GRAY, Printer, 95 and 97 Cliff street, N. Y.

PUBLISHERS' ANNOUNCEMENT!

Twelfth Volume of

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of the year for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon its own merits; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammeled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDD, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers,	- - -	\$2.00 a year,	\$2.00
" Clubs of 3 do.	- - -	1.67 "	5.00
" do. 5 do.	- - -	1.60 "	8.00
" do. 10 do.	- - -	1.50 "	15.00
" do. 20 do.	- - -	1.25 "	25.00

The money always to accompany the names for which the paper is ordered.

The Post-Master, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Post-Master, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, *Weekly Tribune*, or *Weekly Times*, or any other paper or periodical in this city, not costing to exceed two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if enclosed and mailed in the presence of the Post-Master.

Communications for the paper should be addressed to the Editors; subscriptions, advertisements, and all matters relating to the business department, should be addressed to the Publishers,

NEW-YORK, WEDNESDAY, APRIL 12, 1854.

[NEW SERIES.—NO. 31.

FOR PROSPECTUS, TERMS, &c.,

SEE LAST PAGE.

THE PROPER SELECTION OF SHADE TREES.

THE last, and one of the best, rural essays from the pen of the late A. J. DOWNING, was on the subject of "shade trees in cities." We do not agree in all things with Mr. DOWNING—that is to say, he indulged in some fancies regarding rural improvement, from which we occasionally dissent; but in the main, no man of our country has done more—if as much—to awaken the attention of the people to the importance of erecting their buildings in good taste, and properly laying out and planting their grounds, than he. Wielding a facile, free, and occasionally dashing pen, he impressed his sentiments readily and forcibly on the minds of his readers; and although we think his models for dwellings were as a series, faulty in some of their most important requirements; and that, in the numerous structures which were copied from them, many in their occupation will prove unsatisfactory. Yet, to his taste and general good judgment in the selection and disposition of shade and ornamental trees, DOWNING had no superior. His thoughts, while discoursing of trees, were always glowing, and, like their own shadows, always refreshing. "Down with the Ailanthus!" was the sudden and vehement expression of DOWNING in the essay to which we have alluded, after having for years been praising and recommending it in his books. Now, this poor, denounced Ailanthus is called, in the nursery catalogues, the "Tree of Heaven," by way of pre-eminence! It has been planted, perhaps, more than any other *foreign* tree ever brought into America. It has been petted and propagated in large towns, amidst brick walls, and beneath stony pavements, more than any other tree whatever. In some of our large cities—the upper wards of New-York, in Brooklyn, and all over Cincinnati, for instance—from the last of May, through June, and into July—with its upright, stag-headed branches, and numerous lobed leaves, at flowering time, "it stinks and shines like rotten mackerel by moonlight," as the cynical JOHN RANDOLPH, once said of a distinguished orator and politician, whom he hated. We agree, that in close contiguity to the dwelling, or on the borders of streets, the Ailanthus has no fitness; but in the proper place, as a tree to make one of an agreeable variety, its peculiarity of head, its clean stem, and striking contrast to our American trees, make it desirable to a limited extent; and in a large collection, where a variety is sought, we would always, as with the Lombardy Poplar, sparingly adopted it.

Another tree, unoffending, save in one or two particulars, is embraced in the sweeping anathema of DOWNING—the Abele or Silver Poplar. This is a tree of large growth, and in the silvery color of its leaves, as they lift and wave in the breeze, makes another contrast to our deep-shaded forest trees. Like the Ailanthus, we would distribute it occasionally among our plantations. The chief objections to both these trees are their proneness to throw up suckers—a bad habit, we admit; but in grounds laid in grass, and particularly where cropped by cattle, or sheep, which eat them down as fast as the young shoots appear, this propensity proves no forbidding objection.

We have been disposed to remark more pointedly in relation to these trees, because this article of Mr. DOWNING—probably from the fact that it was the last which he wrote—has been extensively copied in the periodicals of the day, throughout the country; and also from the fact that he proposed and highly recommended another tree in their place, to which, unless extraordinary pains be taken in its early preparation for transplanting, objections equally strong exist, but of entirely different character—the uncertainty of its growth—or rather, the certainty of its failure—in a great majority of instances, where it may be introduced by transplanting.

This tree is the *Tulipifera Liriodendron* of the Botanists, or common white-wood, or Tulip tree of our forests. This is a truly grand and beautiful tree. It throws up a straight, clean shaft, sixty to eighty feet high, and three to six feet in diameter, on strong soil in its native forests. Its leaves are deep green, broad, and obtusely lobed, and its flower conspicuous, tulip-shaped, and bronzed yellow in color. It is a sweet, clean, beautiful, stately tree, cone-like in shape, and these are great qualities to be combined in any one American forest tree. Its objections, as a tree for common planting, are its spreading, fibreless roots, which run far out from the body, in addition to a pertinacious tap-root, running directly down into the sub-soil and rendering it uncommonly refractory in transplanting—particularly when self-grown, in its native grounds. The only way to remedy this difficulty is to grow them in nurseries, with frequent transplanting and cutting off the tap-root, in order to give them, so far as they are susceptible of it, a fibrous *habit* or *tuftiness* of roots, until they are of sufficient size for permanent plantations. To this should be added a rich, warm, friable soil. With these qualifications we commend them to planters at large; without the anticipation, however, that they will ever become common for shade or the arbor, for the reason that such truly fine trees as the elms

and maples exist, free from these objections, and are so much more easily propagated and grown.

These last-named trees, the elms and the maples, in all their varieties—both hard and soft—we cannot too highly recommend to the planter in every sort of soil and position where they will grow. It is poorly worth while to enumerate their good qualities, as every one of the slightest observation knows them. We would also suggest the attention of our tree planter, and nurserymen to the planting and propagation of the varieties of the native oak, so abundant in American forests. The oak is an emblem of strength and endurance. It is a noble, stalwart tree, stretching its brawny arms out far and wide, and towering as loftily as its more rapidly-growing companions of the forests. No one who has seen those fine specimens of native oak in the public squares of Philadelphia, but must have admired their vigorous forms, and strong, spreading branches. They are striking specimens of successful growth. Yet the same objection exists to the oak as to the white-wood—its wide-spreading, lateral, and deep-deseending tap-roots; and for successful planting like the latter, they should be nursery grown. Of all the varieties, the upland white, the common oak of the ship-builders, and swamp, or lowland white, and the over-cup oaks, are the grandest in their growth and stature. The latter throws up antler-like branches, which, when denuded of their leaves, have a bold, striking appearance, with less of spray than the others, but a deeper colored, larger, and longer leaf. The red, yellow, gray, and black oaks, as they are severally called, but which in reality differ little in size and appearance, are also noble trees, and grand objects when standing apart, or in groups in the park, or on the lawn.

The hickory, in all its varieties, is a graceful and well-grown tree; but more than the oaks, even obnoxious to the tap, and spreading, fibreless roots. They seldom live when transplanted from their native grounds; although taken young, we have known successful instances of the kind. To make success in any way certain, nursery growth is necessary, more so, if possible, than with oaks and white-woods.

It is hardly worth while at this present writing, to speak of the elm and maple, with which, in all their varieties, our streets, lawns, and avenues are so commonly embellished. They are always in place, and always appropriate; the noblest of shades and majestic objects to the eye. They are free from the objections named in the other trees. So it is with the white ash, yielding little in pretension to the elms and maples; but leaving out later, and casting its foliage earlier in the season. The sycamore or buttonwood, was once a tree that scarce had its

compeer in brawny strength and stateliness; but for the last twenty years a fell disease has so afflicted it, that unless it soon recovers, it is wasting time to plant it.

After all that has been said, we advise the planter of shade and ornamental trees, desiring the full attainment of success, as a general rule, to watch the trees in the forests near to him, and in his selections to plant those kinds mainly, which appear the most vigorous, healthy, and flourishing in the soils like those into which he is about to transplant them. When selected from the forest, it is better to take very young trees, not over three to five feet high, otherwise they are very liable to die, especially when set out in exposed situations; and in any event, in five to seven years, the smaller tree will have overtaken the larger one, and after that rapidly pass it.

AGRICULTURAL EXPERIMENTS.

WE welcome to our columns the author of the following, which is one of that class of well-written articles—containing food for the thought—with which we delight to store our columns from week to week. We do not recognize the writer by his initials, and we hope that he will favor us with his name and further acquaintance.

For the American Agriculturist.

Knowledge is an accumulation of facts; from these are deduced principles, which, formed into a system, become a science. Experience, that teacher of age and celebrity, is simply an observation of occurrences, extending over a greater or less period of time, and depending for value upon the skill and accuracy with which the observations have been conducted, and upon the extensiveness of application of which their deductions are capable. From the earliest periods of civilization to the present, all arts and sciences have been greatly indebted to experiments, conducted for the express purpose of ascertaining some fact by which to establish a principle.

It is true, that many of the arts have derived much valuable aid from accident, or rather from observation made upon accidental occurrences, and that the truths and principles derived therefrom have rendered large service to the cause of progress. Yet ere the crude suggestions furnished by accident could be matured into principles of value, there has been required in every case, much of laborious research and patient investigation, by which to determine the true value of the suggestion, and to bring it into a state of the greatest utility.

Agricultural science is preëminently a science of fact; its ramifications are as extensive as the earth, with its fruits and the influence which affect their production—its animals, and the causes which may injure or benefit them. Here, then, is a field for experiment, for careful and thorough experiment. Theory in this science is worthless, unless it be sustained by an array of convincing facts, and the manner in which these are to be procured is by investigation.

Farmers, as a class, possess excellent facilities for the prosecution of experiments, and there is assuredly ample room and verge enough, in the matter of choosing a subject, for the same. There are many valuable discoveries in natural science yet remaining to be made. There are many "mooted points" in the economies of agriculture, concerning which the men of theory

will never form a harmonious conclusion, and even if they succeed in so doing, their determination will be of small value, if not supported by the testimony of facts, deduced from careful observations.

The season of life, growth, and activity, is opening upon us, and even now is passing the last "day of grace" in which the cultivator of the soil may chalk out the plans for the coming campaign. To let each and every one who would add to the knowledge of his time, benefit his fellows, and lend a legacy to the future, select some point upon which he desires additional information, and proceed to make it the subject of thorough study, and careful experiment, conducted with all the skill and intelligence, of which he is master.

In choosing a subject upon which to expend thought and labor, each farmer should be guided by the desire to render the results of his work of the greatest possible utility, hence he should select some point, for the elucidation of which, he has the most extensive natural facilities, and with which he is most competent to grapple.

I counsel none to attempt any thing which will subject them to loss or inconvenience, but let each act according to his means and ability. If these are large, he can take up some point of the greatest interest, and be able to expend means and labor upon it without injury to himself, and with much benefit to society.

The man of smaller means can choose a task, requiring in its prosecution less of time and labor, with no other expense, and yet produce, by thought and care, a result which will benefit himself, not only by the fact arrived at, but also by the very labor and thought required in the process itself.

True it is, that the results of experiment are not infallible, not always valuable, even, yet if they be conducted with care and skill, they can scarcely fail to add something to the fund of useful knowledge. Suppose that the foregoing suggestions be carried into practice, and at the close of the experiment, the results be written out and furnished to our friends—the agricultural editors—who doubts that something useful may result therefrom. I, at least, do not, and hence throw out these few crude suggestions, in the hope that some person may be spurred to action.

For the American Agriculturist.

HOVEN IN CATTLE.

A REMEDY WHICH HAS BEEN TRIED AND FOUND EFFECTUAL.

BEING in "the cars" a day or two since, I was compelled to play the eaves-dropper to the conversation of a couple of intelligent-looking farmers. They were talking of the cause and cure of "Hoven" in neat cattle. I was really in hopes to learn something new; but not so, for after discussing the merits of many exploded remedies, they came to the conclusion that "sticking" the dumb sufferer—as they called it—was the best cure, which was explained by a description, as near as I can remember, "to stick a knife between two of the animal's short ribs, a little way from the back bone, deep enough to reach the paunch, and he'll get well at once."

Now, without a word in condemnation of this barbarous practice, it is plain that the cause still remains, although the effects may be in some measure removed. Recent conversations with those who have the care of neat cattle, convince me that there are many people that are

ignorant as to some of the causes, effects, and of a single humane cure, for the dumb sufferers.

Although I am no veterinarian, yet I have in years past seen many valuable animals suffer and some die of nothing but "wind hoven," as it was then called; and by numerous inquiries and observation, I found that hoven was produced by several causes, such as gorging large quantities of green clover, green corn, cabbage, and such like vegetables, apples, potatoes, new corn, oats, or other grain; and occasionally by violent exercise, such as jumping a fence, running after eating heartily, and by drinking while very warm.

When an animal gluts on any food, imperfect mastication is the result, and if the quantity thus eaten is large, the temperature of the stomach is lowered to such a degree that fermentation is favored, which generates carbonic acid gas, and unless it finds an exit, the animal is at once "hoven." I remember to have seen one animal opened that had died of hoven, and it was found to have originated from the stoppage of the orifice leading from the large to the small stomach, by a small wad of corn husks.

I opened one that died of hoven produced by leaping a fence, and found that about one foot of the intestine that leads from the small stomach was completely closed by inflammation.

But from whatever cause hoven is produced, the effect sometimes is a swelling of the entire chest of the animal, often to such a degree as to stop the breath, at others a rupture of some one of the intestines, or if not a rupture an inflammation sets in, drowsy ensues, and too often death is the final result. After I had learned the above facts, I thought that a remedy might be administered that would remove the cause without injury to the dumb sufferer, and my first trial was attended with a happy result, nor have I known it to fail, though it would do so unless given in proper season, which is as soon as the animal is found to be hoven.

The remedy is simply to give to a common sized cow, a quart of white-wash, larger cattle more, and smaller ones less. Repeat the dose when relief does not follow, in thirty minutes. It would be well to move the animal so as to mix the medicine well in the stomach, and thus bring the lime in contact with the gases, which it readily absorbs, reducing the bulk, and leaving not over half a pint of powered lime to occupy the space of gallons of the gas. Every chemist knows just how the whole acts, but lest some one may not know how to prepare the white-wash, I will give the best method, or what I have found to be so:

Take a lump not larger than a hen's egg of fresh burned lime, such as is commonly used for white-wash, slack it in warm water, adding enough to make the wash not quite as thick as cream. Administer it cold. In the whole of the above, I have tried to avoid any technicalities by using the common language of our farmers.

J. H. D.

Morristown, March.

We once had a herd of cows break into a field of corn while the grain was in the milk. They gorged themselves, but all got over it except one, which died the third day. The usual remedies were resorted to, in order to effect a passage, together with injection—administered through an unbreeched gun-barrel, instead of a syringe which was not at hand—but all without effect. On opening her, the upper and lower stomach, together with the intestines, were filled with stalks and husks of green corn, all as dry as if they had been lying in the sun. The white-wash would scarcely have effected a cure in this case.

A COW WORTH HAVING.—John W. Wilson writes to the *Hampshire Gazette*: "I have a cow from whose milk sixty pounds and five ounces of butter were made in twenty-eight days, in the month of December, 1853. This

same cow, in one week, ending the 26th ult., made seventeen and a half pounds of butter. The daily average of milk was fifty-one and one-half pounds. Her feed was six quarts of equal parts Indian and broom corn meal, and one pumpkin per day. I have no doubt she will average fifty pounds of milk per day for four months to come."

MANAGEMENT OF EWES.

TREATMENT AT THE LAMBING SEASON, &c.

At this particular season, I know of few subjects more appropriate, or more worthy a place in your valuable columns, than a few remarks on the treatment and management of ewes before and after parturition. It cannot fail to be fresh in the memories of most—the unusual amount of fatalities that occurred to ewes during the last lambing season; many farmers in this locality being losers to the tune of from 5 to 20 per cent. of their whole flocks. To account for such an unusual occurrence, seems to me perfectly explicable, as I am inclined to believe, that by proper treatment it never would have taken place; and no more mysterious a panacea for its total prevention would have been required than a liberal supply of nutritive food, combined with proper shelter during the protracted snow storms.

In cold, stormy weather, animals of all grades require more food, in order that the body, suffering from the lowness of the temperature, may have an increased supply of carbon, by the conversion of which into carbonic acid the body is kept up to its natural warmth. If such a supply is not forthcoming, the consequences are emaciation of body, deterioration of wool, a host of diseases; and death itself is a concomitant usually attendant on such neglect. It is a mistake common among farmers that any refuse food will suffice for brood ewes during the winter months, such as turning them into a field noted for the coarseness of its herbage, and possessing so little nutrition that it will scarce fatten a sheep per acre during the summer months. Indeed, they seem to be of the same opinion as the Scotchman, who cared little for the quality or cleanliness of his food, provided he had plenty of it. Now, I dissent entirely from this way of treating them; and I maintain that, if it pays to keep ewes at all, it pays to keep them well. From the greatly increased and increasing consumption of animal food in this country, it is a duty incumbent on the farmer, for the general as well as his own individual interest, to produce the greatest amount of meat from the least quantity of food, and in the least possible time. For the furtherance of such an object, nothing is of so much importance as liberal treatment and care of the animal during the early stages of its existence. Unless a brood ewe is kept in an even, good condition, it is quite impossible she can either be healthy herself, or give milk to rear a healthful lamb. It certainly is not absolutely necessary that a ewe should be so fat as to be what is called "cloven above the tail;" but the nearer she approaches that state, the better.

I beg to give a short account of the way in which my flock, consisting of 100 ewes, are managed. The tups are put to in the first week of October, two being quite sufficient to serve 100 ewes. Before and during the time the tups are among them, they are liberally supplied with turnips, in addition to their grass. It is of the highest importance to have them in a mending condition at that time; and the increased fall of lambs well pays for all extra food given.

When all are served, and by which time the grass begins to fail, they have a supply of tops and small turnips daily, to keep them in their good condition, until within a short time of lambing, when a more liberal supply is given.

During the snow storm last year, they had a feed of swedes daily, care being taken not to give more at once than was consumed in one day; a supply of hay, and one pint of bruised oats, to each sheep, per diem; a supply of salt

(which they have all the year round,) *ad libitum*. By such treatment they were kept in a healthy, thriving condition; and not the death of one ewe occurred in the flock. For 100 ewes, I have at this date 131 yearlings now fattening on turnips, cut and put in troughs. Some of them are fat now. I expect they will be so by the beginning of May, at which time they will average 72 lbs. of mutton each sheep. They are the Bakewell Leicester breed. I consider, if a little of the Cheviot blood could be introduced, they would be all the better for it.

Now, when I contrast some of the statements made by my neighbors, I am fully convinced that my exemption from the fatality was wholly and entirely owing to the liberal way in which my flock was fed.—*M., in Mark Lane Express.*

For the American Agriculturist.

ORNAMENTAL SHADE TREES—TRANSPLANTING.

IN a former communication, I confined my observations more particularly to our native shade trees, and the views were not advanced without an object. I was willing to show that class of your readers who are novices in the matter, the difference between expending labor and capital in an intelligent manner, and *vice versa*.

With evergreens, comparatively few have been successful. I have myself witnessed constant and repeated failures. Owing to the fact that many of our native evergreens are usually found growing in wet places, and without a corresponding dampness of soil after transplanting, they seldom thrive. There are other causes of failure, but this is the more prominent one. I have seen beautiful evergreens growing on upland in Pennsylvania, and I believe they succeed very well in their removal.

One great reason why nursery plants will generally succeed better, and much more likely to grow, is that they are grown from the seed, in open cultivated situations, and transplanted two or three times in the nursery, so that they have become accustomed to it; and being deprived of their tap-root when very young, they have had every inducement to shoot out numerous branching fibrous roots—the soul and life of the tree. They may be said to have become habituated to a change of location. The soil of nurseries generally is, or should be, mellow and fine, which is favorable to the development of these small fibrous feeding roots, the absence of which, would be unfavorable to a successful removal. I consider this alone, a sufficient reason to explain why nursery plants are more successful in their removal, and consequently a much more satisfactory investment. The Sugar, Norway, Scarlet, and Silver Maple; the Horse Chestnut, the Mountain Ash, the Linden, the English and American Elm, comprise a few of the most desirable ornamental trees to be found in the nursery.

Before repeating the briefest directions possible for setting out—which will be only to reiterate what has been a thousand times written—let me urge a fact of the utmost importance for consideration. It is this; no care that *will be likely to be taken* with plants, can compensate for the loss that will follow, if the proprietor of the soil spares or withholds an intelligent interest in their success.

Transplanting.—I dare not premise, that I shall advance any thing new on this point, but only hope to make the impression take fast hold upon the people, that it is the worst of economy, or rather no economy at all, to do it in a cheap, quick, and slovenly manner. Dig out and thoroughly pulverize the soil, from a hole from 4 to 6 feet in diameter, and 2 feet deep; fill in to the required depth with the best soil within reach. Use the top soil taken out of the hole, if it is good, for this. Place the roots in a horizontal, spreading manner, and see to it that no tree is set out more than *two inches* deeper than it stood in the nursery. Then fill in with *good rich soil*, made fine and mellow with the spade. And now remember, that though your tree is

well set out, your work is just half done. Well, says one, what next? Just exactly what I see in half the cases through the country neglected, viz., staking each tree if within an enclosure, and tying it firmly, to keep the wind from shaking it to and fro, and keeping the roots from taking a good hold of the soil at once, and if outside of an enclosure, of ten-fold more importance is it that you protect your trees with a durable and substantial frame, against horses, cattle, boys, &c. W. DAY.

Morristown, N. J.

STUD FARM AT DUDDING HILL.

WE hope the day will come when the United States can show breeding studs like the following:

The general interest connected with the important subject of breeding horses, prompted me to obtain permission to visit the stud farm at Dudding Hill, the property of Messrs. Henry and Cheslyn Hall. Favored by a friend with an introduction to those gentlemen, I was received with the greatest courtesy, and, attended by the stud-groom, inspected that admirably-conducted and truly surprising establishment. The first impulse was astonishment at finding such a thoroughly rural tract of country within five miles of London. Agriculture also, directed on the most approved and scientific principles, forms an interesting portion of the active engagements to which the proprietors of Dudding Hill stud devote their capital and attention. Having arrived at the appointed place, looking upon the grass lands by which I was surrounded, I could not avoid pausing for a moment to assure myself that I had not been conveyed by some talismanic agency to the pasture fields of Leicestershire—an imagination all but confirmed when I heard the harriers at a short distance, merrily chasing their game.

The buildings which are appropriated to the accommodation of the stud are as complete as judgment can devise, and may be taken as a model by those who desire to construct new ones for a similar purpose. To describe them in detail would be superfluous; but there is one which demands especial notice, being unique and better arranged than any thing of the kind I have hitherto seen. It is a circular arca, enclosed by lofty palings for exercising the stallions; the bottom is littered with straw, and the sides are securely defended to the height of five feet with the same material. The doors being closed, the horses are perfectly free from danger or excitement. It is also a suitable place for mares to receive the addresses of the stallions. A portion of the land has only been in the possession of the Messrs. Hall a short time; and there is a marked distinction between that and the land they have had a longer period, where the masterly hand of superior cultivation is visible. As I was informed the necessary improvements were in progress, it will at no distant period be brought to an equal state of excellence and accommodation.

The selection of the stallions has been made with great care and circumspection; indeed, it would be very difficult to find any department on the estate, connected with the stock, over which the presiding judgment has not been exercised with consummate skill, whether it be the horses, the Short-horns, or the pigs.

The writer then names the stallions with their pedigrees now in use at this stud, most of which are the best horses of the day. Among these we find Epirus, Harkaway, Libel, Kremlin, Retriever, and Cleveland Short-legs.

I saw also a great number of useful brood mares, foals, yearlings, and two-year-old, amounting to about one hundred and fifty. To particularize them all would occupy too much space. I must therefore content myself with stating that they looked in excellent condition, and do justice to the care of the stud-groom. The

accommodations provided for them are excellent.

From such an admirable selection of stallions, breeders cannot fail to find those which are suitable for all kinds of mares adapted to produce horses of the most valuable class. Those who do not feel confident in their own judgment may rely on that of the proprietors of this establishment; for it is quite evident they would not have an animal of inferior kind on the premises. The same discrimination is manifest in every department. In breeding horses, three essential subjects should be most scrupulously observed; the choice of proper parents, providing them and their offspring with suitable food, and judicious treatment of the legs and feet.

If these points were thoroughly respected in their various details, the progeny would be of a superior kind; weak, infirm animals would be exceptions. Unfortunately, however, one of the first sources from whence success can be reasonably expected is disregarded, that is, the superior and valuable foal will be the issue of an inferior mare is an anomaly difficult to reconcile. It is a theory dangerous to circulate; for too many persons are inclined, when they have mares which are worthless for other purposes, to consign them to the stud, upon the chance of their producing good foals. Loss and disappointment are almost invariably the result.

Opinions vary whether foals partake most of the good or bad qualities of the sire or dam. Many examples may be brought forward to maintain an argument on both sides; but the safest plan, and the only one to be adopted as a rule, is to avoid breeding from inferior animals of either sex. Being in possession of a good mare the next consideration is, which stallion is most suitable? and in this selection much discrimination is necessary. It is an established fact, that animals do not invariably partake of the nature and property of their immediate parents; but they take after their grandsires and grandams, and even more remote generations. This is very palpable with reference to color.

Nothing can be more likely to entail disappointment than expecting to obtain symmetry and perfections by the combination of great extremes. In hope of breeding a weight-carrying hunter, it is useless to put a cart-mare to a thorough-bred horse. Fancy the produce, with head and body resembling the dam; neck, shoulders, and legs like those of the sire; and a precious specimen of deformity it would be. But this is not an imaginary problem. Much as I admire Cleveland Short-legs, I should more contemplate his being the sire of a hunter from a thorough bred mare. It is the adaptation of every horse to the purpose for which he is best calculated that renders him of the utmost value he is capable of attaining, and success is mainly dependent on the judgment of the owner in making a suitable distinction. If he is intended to breed carriage-horses from good-shaped, powerful mares, and something of the same stamp as the horse just named, a better kind of animal cannot be desired.

As we require horses for various purposes, it is very important to cultivate those which are most perfect in their respective properties, and this can only be accomplished by keeping the different classes very nearly distinct, otherwise we obtain a mongrel breed, scarcely fit for any thing, certainly not fit for breeding hereafter. This remark is particularly applicable to mares which are not thorough-bred; unless their lineage is known, and the properties of their progenitors, breeding from them is quite a matter of chance. Such a mare may have the appearance of being well-bred, though her grandsire may have been a cart-horse; and she may requite her owner, whose hopes are concentrated in the prospective of breeding a hunter with the prototype of her grandsire. These and similar coincidences have led so many persons to regard the subject of breeding horses with distaste. They or their neighbors have been disappointed, while others who have devoted more attention to the subject have been suc-

cessful. Thus it is often declared that breeding is dependent upon chance; but that is a mistaken opinion. Many circumstances may occur, the causes of which at the first glance we cannot account for, but investigation will generally elucidate the mystery. Nature's mandates will be obeyed; and persons who will take the trouble to investigate her laws, will take advantage of precepts for their future guidance.

Breeders of racing stock have in many respects fewer difficulties to contend with than those who breed for other purposes. They have the Stud Book and Racing Calendar to refer to, by which they can determine what crosses of blood have been most successful. By this they are enabled to avoid incestuous strains. On that account, mares by Touchstone would not be suitable to Harkaway, as the grandsires of each, Whalebone and Whisker, were own brothers. Epirus would be the selection, and for this we have examples. Pyrrhus the First, one of his sons, was out of Fortress by Defence; Defence by Whalebone; Lamar-tine, another, out of Grace Darling, also by Defence. Upon the same principle, mares by Sir Hercules would be admirably adapted to Epirus, and most others which are descended from Whalebone or Whisker. Mares by Venison would be suitable either to Epirus or Harkaway; and as there is such a well-selected diversity of blood among the stallions at Dudding Hill, there can be no difficulty in procuring that which is most eligible.

It has been frequently noticed that the best foals have not been brought forth till one of the parents have become advanced in years; but this more often applies to stallions than mares. There is certainly an objection to breeding from very old mares, because their offspring is generally smaller than those which are foaled during the most vigorous period of their lives. Many celebrated breeders appear to have a great predilection for very young mares; but I believe both extremes should be avoided. It may be remarked that some of our best horses were first foals; Doctor Syntax, Filho da Puta, Touchstone, and Sir Hercules. Several others might be enumerated, but they do not occur to me at the present moment. Paynator was twenty years old when Doctor Syntax was foaled; Whalebone, the sire of Sir Hercules, was the same age; Haphazard was fifteen, and Camel nine years old when their respective sons came into life. These examples are in favor of patriarchal sires and somewhat juvenile matrons. The age of Doctor Syntax's dam is not known, but the others were six, five, and four years old respectively.

An attempt is very frequently made, when a mare is undersized, to endeavor to compensate for that defect by putting her to the largest horse that can be found. I believe it to be a most erroneous practice; because the offspring, taking after each of its parents, is commonly disproportioned. Unless the anatomical proportions are accurate, perfect action cannot exist; and without that, a horse cannot be gifted with either speed or endurance. If a mare be undersized, it is far more probable that success will follow in the event of her being put to a moderate-sized horse, relying on good keep to bring her offspring to the required standard, than to attempt to force nature by any means that are opposed to her principles. Whatever foals are reared on the Dudding Hill stud-farm will not be deficient in their growth from want of proper food or attention.—*London Sporting Magazine*.

PRODUCE AT KENOSHA.—The *Kenosha Tribune* has obtained from the different warehouses, the amount of grain in store at that point, whence it sums up the following: Wheat, 56,564 bushels; oats, 71,187 bushels; barley, 6,307 bushels.

We understand from good authority, that there is now in store at Sheboygan, awaiting shipment to the Eastern markets, about 100,000 bushels of grain, besides other freight. Captains and vessel owners may find it to their ad-

vantage to inquire there for freight.—*Chicago Tribune*.

A HORSE BIOGRAPHY.

"THERE goes 'old Dandy,' and a noble old fellow he is too," said some one just now. We looked out and saw this famous horse, and could not help thinking how bravely he had done his duty in his day and generation. "Old Dandy" was of highly respectable parentage, and is a native of this country. He was raised by Harry Olmsted, of Greece, and is about 25 years of age. He was first put in livery in 1835, and has remained in that harness ever since, without losing a day. He was first owned by Mr. Christopher, and ate his oats in the old yellow stable that occupied the ground upon which Mr. Hamilton's fine block now stands. He has been owned at three different times by Mr. George Charles, whose property he is now, and once by Mr. George Walbridge. He has always been owned on State street.

"Horse-men" think that "Dandy" is one of the most remarkable quadrupeds that ever trotted in harness. He has always had thews of iron and muscles of steel, with the "constitution of a horse," an eye of fire, and a way of getting himself up that astonishes all who see him. He is a "Dandy" of an animal, gay, showy, impetuous, strong-bitted, and unlike other dandies, useful. Even now, with all his years upon him, he is one of the best, if not the best "driver" in town. His muscles have lost none of their elasticity, and his eye none of its fire. He is a dark chestnut horse, of good average size, and with a loftiness of bearing, as if conscious of his own noble traits.

In these days "Dandy" confines his journeyings to short drives about town and brief ramblings in the country. In former years he has done his 75 miles before a wagon, between breakfast and tea, time and again, and rather liked it. Some years since he was driven 68 miles a day five days in succession, and was ready for a drive to the lake or out on the ridge, as soon as he had taken a bite.

"Dandy" was never sick a day in his life. He ignores doctors. He was never at grass. He has lost all natural fondness for green fields and the like. He admires oats and such like substantial fare, but he despises fresh croppings in the country. He has often been sent to grass 4, 6, and 8 miles in the country, but he leaped the fence and was in the stable before the man returned who took him out.

"Dandy" runs away. He likes thus to terrify young men unskilled in horses, particularly if they are inclined to show off to the lady whom they may have at their side. Then "Dandy" laughs at their feeble strength, he contemns feminine shrines and screams, and rushes off headlong, with no thought except of his familiar stall. Facetious Dandy! When a lady loses confidence in her driving cavalier the ride is apt to be short, and you, with your tricks should be held responsible for it. But Dandy does not always choose to run away from unskilled hands. He sometimes indulges this propensity even when a master hand is at the ribbons. He wishes to show the vanity of human pride, and how much stronger his hard mouth is, than the strong muscles which try to control him.

"Dandy" loves an inn, a country tavern he smelleth afar off, and always hauls up before it just long enough for the mixing and imbibing of a beverage, and then he proceeds. Drive him out to George Wimble's, and see if he can be driven by any tavern where there is a bar. Not unless he has in his old age taken up for the "Maine Law." "Dandy" was always a fast horse, and even now he can out trot the majority of horses that compete with him. Still it is not so much his speed, as his bottom and his tremendous endurance that give him notoriety here, and make him a marvel among "horse-men" every where.

"Dandy" has been in livery 19 years, or about 6900 days. More than that number of

times has he been harnessed up, put before a "wagon" and put through at the top of his speed. Not less than \$10,000 has he earned in these 19 years for his several owners. He has seen a vast number of "awful good times," as they phrase it, in those 19 years. But he was never tight. He has stood under the tavern shed, or munched his hay in the tavern barn, while the sound of the dance or the revel came to his ears, and he thought of the fierce drive that was before him. What hosts of young men has he "seen through," and in how many delightful scrapes has he participated. Yet the old fellow is just as ripe for fun as he was in the hay-day of his youth. He does not grow old. Time, which sets its seal on every thing else, has spared "old Dandy" and left him as frolicsome and spirited as if he had not reached his teens. May he live a thousand years.

We have tried to immortalize our friend "Dandy," but we confess to only a general acquaintance with his career. Those who have known him best are loudest in his praise. He is worthy of even a longer article than this. He knows as well as we, that when he trots along over the pavement, every body is saying, "Look at old Dandy."—*Rochester Daily American*.

For the American Agriculturist.

STANCHIONS FOR CATTLE.

NOTICING an inquiry in the *Agriculturist* as to the best method of building a stable for cattle, whether with stanchions or stalls, allow me to say that I have tried both, and think stanchions preferable for many reasons, the two chief of which are, that cattle thus put up occupy less room, and they will keep much cleaner than in stalls, unless much care is taken to keep them bedded. Perhaps it may not be amiss to state my method of building stanchions, because many who wish to build them have no rule by which to be guided, and are under the necessity of guessing at the dimension. Take a long piece of timber, the length of the stable, place it where you wish your stanchion to come. Mortice your timber so that your cattle will each occupy a space of 2 feet 8 inches. The standard part should be wide at the bottom, in order to keep the hay in, and the cattle from putting their heads through in putting them up. Take a log the right length, that will make plank from 18 to 20 inches wide, and have it sawed into 2 inch plank the whole width. Then split these slanting, so as to make them about 4 inches wide at one end and 14 to 16 inches at the other. Place the large end down, to keep the hay from working out. The latches should be from 5 to 6 inches wide. The standards being narrow at the top gives them plenty of room to play back and forth. When crowded up they may be fastened with pins or latches. I use for the top, two pieces of scantling, pinned to the sleepers overhead, for them to play between and to fasten them up. I find that the space required for cows or common cattle is 8 inches, which gives them plenty of room, and also fastens them beyond a doubt. For oxen it is necessary to make them wider. Any person wishing to build stanchions need not fear a failure if he follow this rule. In building stalls I use swing gates made of an upright scantling for a standard, with a hard wood board from 10 to 12 inches wide, morticed in and fixed so as to swing, or I place upright poles in the edge of the manger, with chain ties which slip up and down on these poles. These by many are considered equal to stanchions. S. A. COLLINS.

"Pleasant Ridge Farm", Sodus, Wayne Co., N. Y., }
March 31, 1854.

P. S.—Enclosed you will find a few seeds of the Sweet Potato Squash, a variety much prized with us. S. A. C.

[These seeds we will give a trial in our garden.—Ed.]

The fewer our wants; the nearer we resemble the gods.

CLAIMS OF AGRICULTURAL PATENTS

FOR THE WEEK ENDING MARCH 2, 1854.

SMUT MACHINES.—Seymour Ketchum, of Lancaster, O.: I do not claim of itself building the concave of staves with vertical openings between or in them, for the dust &c. to pass through.

But I claim the concave constructed as described, that is to say, of loose staves, so fitted to or connected with the heads of the concave, as to be capable of circular adjustment with facility and dispatch, as specified, for the purpose of varying the number and widths of the escape openings between the staves, the said staves being formed on their inner face with a longitudinal step or steps inclining outwards backwardly in relation to the travel of the runner, whereby the width of the openings between the staves may be made large, so as to form a ready escape for the smut, dust, and other extraneous matter without letting out the grain or wheat there through, and whereby the clogging of the escape openings by damp smut is avoided, as set forth.

MACHINES FOR FORMING CULTIVATORS' TEETH.—David B. Rogers, of Pittsburgh, Pa.: I claim the arrangement of the cutter or knife and swaging dies, when constructed and operated as described, whereby I am enabled to swage the sheet blank into shape, and to give to the foot of the tooth by the cutter its shape and edge, after it has been swaged into form, and when it is held firmly between the dies.

CHURNS.—R. H. Harrison (assignor to R. H. Harrison & J. S. Gallagher, Jr.) of Washington, D. C.: I claim, first, the construction of a churn vessel with hollow or solid double concave adjustable detachable side gatherers, as shown.

Second, I claim the construction of a churn reservoir dasher having curved or deflective radial chambers of a concave-convex form, with direct radial wings or flanges, as shown, and using the same combined with the double concave gatherers.

Thirdly, I claim also the double application of warm and cold water or ice, in combination with the dasher and the double concave gatherers, as set forth. I do not however claim the application of hot or cold water solely, in the process of butter making, as the same have been employed separately or distinctly heretofore, as is well known.

DISCHARGING APPARATUS OF HARVESTERS.—A. J. Cook, of Enon, O.: I claim the device for forcing the unbound grain from the table, in combination with the arm at the end of the reel and the apron, by means whereof the grain is carried from the platform to the receiving table, and thence deposited upon the stubble in convenient quantities for binding.

HARVESTERS.—Wm. H. Seymour, of Brockport, N. Y.: I claim the combination of the shaft, E, for rotating the pinion, the shaft, I, for turning and carrying the rake and connecting the mechanism constructed and arranged as described, whereby the rake is turned up and down, and firmly held in either position in a simple and convenient manner, without producing an undue strain upon any part of the driving gear.

I also claim the adjustment of the rake at varying heights from the platform in its elevated and depressed positions, by means of the device described, or its equivalent.

HARVESTERS OF GRAIN.—B. G. Fitzhugh, of Frederick, Md.: I make no claim to the removable blade in itself.

I claim, first, the movable blade in the fingers, arranged and secured as described.

Second, the combination of a curved reciprocating knife with a curved row of fingers and a curved platform, as described.

Third, constructing the reel with curved beaters as set forth.

Fourth, the combination of a continuously revolving sweep rake with a revolving reel, which disposes the grain upon the platform with

its stalks converging to the axis of the rake, as set forth.

SEED PLANTERS.—L. B. Fisher, of Coldwater, Mich.: I do not claim the form of the frame or the method of operating the slides. But I claim the combination of the rod, lever, clevis, and pin, when the latter is movable in a longitudinal slot for raising the teeth from the ground, as set forth.

I also claim the attachment of the rods, operating the slides to the hook, as described, so that the slides will remain at rest during the turning of the implement, as set forth.—*Scientific American*.

DANGER OF PAINTED PAIS.

I WOULD desire to direct the attention of every readers of your paper to the danger of using pails which are painted inside, for containing water, for domestic purposes. The oxide of lead with which they are painted, is a dangerous poison, and I know that it is productive of evil in many cases. Last week, having occasion to take a drink of water from a painted pail, which had been in use for some months, I was convinced, from the taste of the water, that it had taken up a portion of the paint, and having analysed the water, I found it to contain a very minute quantity of it, sufficient, however, if a large quantity of the water were taken, to produce those fearful diseases peculiar to lead poisonings. JAMES MANLEY, New York.

We advise all persons to avoid using painted wooden pails. A coat of varnish, on the outside is all the embellishment we ever desire to see on a water pail.—*Scientific American*.

CORN IN THE UNITED STATES.—The *Toledo Blade* estimates the Indian corn to be shipped from Toledo the coming season at 6,000,000 bushels. The largest quantity ever shipped from that port in any previous season was 3,878,047 bushels.

LAND OWNERS IN FRANCE.—The tax-books for France for the year 1854, show that 12,000,000 of the inhabitants, or 1 out of 3, own land, with or without building upon it.

FIGHTING BEES.—To stop bees from fighting, breaking the comb of the robbers is said to be sufficient, by giving them plenty of business in taking care of their wasting honey at home. It is said to have succeeded completely.—*New-Haven Register*.

A FARMER, says Cole, dismissed a hand because in his absence, he set only nine trees in a day. The farmer set out the remaining ninety-one of the hundred himself the next day. The result was that the nine bore more fruit the first year of bearing than all the others.

A LARGE LEG OF MUTTON.—About fifteen years ago, a large sheep was sold in Fulton market, New York, by Mr. Jenkins, butcher, one leg of which weighed 37 pounds! It was bought by the late Charles Henry Hall, of Harlem, at a dollar a pound, and sent by him to England.

A KNOWING DOG.—Nelson, of the *Northern Gazette*, says: "A gentleman in Ansonia, Conn, sends his dog, on the arrival of the mail by the railroad train, for his *Daily Times*, and the dog returns to his master with the paper in his mouth. The other day a New-York *Herald* was handed him by mistake. The dog dropped the paper and springing upon the counter, picked out a *Times*, and wagging his tail in a can't-come-it sort of manner, departed."

Use the means and trust God for the blessing.

Horticultural Department.

To HORTICULTURISTS. — Our weekly issue of so large a journal, gives us ample room to devote to the different departments of cultivation, and we have commenced with this volume, to allot a separate space to Horticulture. We have secured additional efficient aid in its conduction, and we invite horticulturists generally, to send in their contributions on all subjects interesting and instructive to those engaged in similar pursuits with themselves. We are receiving the leading foreign and domestic horticultural journals, and shall be abundantly able to bring promptly before our readers all that transpires, which may be new and useful.

NEW-YORK HORTICULTURAL SOCIETY.

DISCUSSION OF VEGETABLE GARDEN, &c.

THE regular meeting of this Society, was held at their room, 600 Broadway, on Monday evening April 3. SHEPHERD KNAPP, Esq., the President, occupied the chair.

Mr. PETER B. MEAD, Chairman of the Committee of Arrangements for the Spring Exhibition, reported progress, referring to the list of premiums and regulations annexed, with the bills on the table. Mr. PARSONS made a report in part on the finances of the Society.

Mr. MEAD reported to the Society, that Mr. RITTICK made them the very liberal offer of the use of six lots of ground in the vicinity of Stuyvesant Square and Second Avenue, for the term of nine years, for the nominal sum of One Dollar.

The offer was accepted, and a vote of thanks was tendered to Mr. RITTICK, and a committee of five, consisting of P. B. MEAD, JOHN GROSHON, THOS. HOGG, Mr. PARSONS, and Mr. KNAPP, were appointed to examine and report appropriate action with reference to the subject.

Mr. GEORGE S. ROE, AUGUSTUS HEP, and JOHN HEWITT, were elected members of the Society.

The meeting was then resolved into a conversational one.

An Essay by WM. CHORLTON, was read by Mr. SCOTT, defining a good vegetable, and the necessity of a standard of judging them as well as fine animals. 1st. The vegetable should not possess a superabundance of water. 2d. A good color. 3d. Size and flavor. 4th. Even surface. 5th. Solid texture. Critical remarks then followed on the Artichoke, Potato, Turnip, Celery, Cucumber, Tomato; and a committee, consisting of Mr. CRANSTON, Mr. REED, and Mr. MEAD, were appointed to examine the essay, and report on the expediency of adopting it as a standard of judgment.

Mr. PETER B. MEAD read a very instructive Essay on the vegetable and fruit garden, designed especially for the amateur. If any one thing more than any other, added to the poor man's cottage or the rich man's palace it was a well-kept garden. The fruit and vegetable garden ought not to be separated. Where the garden could only be fifty feet by one hundred, care should be taken not to allow the walks to engross too much of the ground.

Direction was then minutely given for a constant succession of vegetables throughout the season, in which care should be taken to avoid two seed crops following each other. A good

garden need cost but little expense or labor. In conclusion, he remarked that the best advice he could give to the novice was, first learn what was to be done, and then do it.

Mr. REED remarked we had listened to two good essays—one on the marks of a good vegetable, and the other on the best manner of raising them. In England, the vegetable establishment was very attractive, but not so in this country. Why was this? A vegetable garden in Europe, was invariably accompanied with fruits, and the effect was very pleasing.

Mr. SCOTT said, in answer to Mr. REED's question, that the difference in capital, climate, and culture was all to be taken into consideration. The old establishments in England, were more permanent in their arrangements, than were the market gardeners in this country, but the question was too extensive to discuss at present. Every vegetable garden should be kept clean and and orderly; but beauty was not to be subordinated to utility.

Mr. MEAD remarked that without doubt, utility and beauty could be more frequently combined than they are now usually in this country. Without any great expense, with a little more taste and a little more care, much might be accomplished. Many do not consider the great benefit to a place pecuniarily. A friend of his expended judiciously six hundred dollars, and then sold his place for fifteen hundred more than he could do before the improvements. He spoke of dwarf trees, particularly Pears, as being well adapted to small gardens.

He thought these fruits, vegetables and plants, had an important moral influence on the family. That man who had not brought his children into intimate acquaintance with these works of nature, had not yet half done his duty towards educating them. Those who live secluded in the city, grow up to be very selfish, and this selfishness would be greatly relieved by a pleasant introduction to the vegetable, fruit, and flower garden.

It was resolved that the subject for discussion at the next meeting should be the Laying out of Suburban Villas. The meeting then adjourned.

The tables were very handsomely adorned with fine flowers. Mr. D. BOLL made a splendid exhibition of fifteen varieties of the Camelia, of which thirteen were very handsome seedling varieties, of his own production.

Mr. LENOIR presented twelve fine varieties of Pansies, almost every one would come up to the standard size—covering a silver dollar—and for color and form equal any we have seen in this country.

Mr. SUTTLE exhibited a fine pot plant of the Azalea Indica—Inveryana, and a large specimen of the Queen Victoria Rose.

Mr. HOGG also exhibited an equally fine specimen of Azalea Williamoni. Neither of the above Azaleas were more than about one foot high, and yet each had about fifty large blossoms.

Mr. SCOTT also presented fine specimens of Hovey's Seedling Strawberries, and Tomatoes, both ripe, from the green-houses of WILLIAM CHORLTON, Staten Island.

ORANGE WATERMELON.—Mr. Peabody, editor of the *Soil of the South*, mentions a new kind of watermelon, which he calls the orange watermelon, and pronounces it a very singular, beau-

tiful, and excellent melon. By cutting into the rind, as you peel an orange, the entire skin peels off, leaving the whole pulp unbroken, which, with care, may be divided into quarters, just as you divide an orange.

THREE BEST KINDS OF LATE KEEPING APPLES.

M. HURLBERT, of Arkport, Steuben Co., N.Y., asks: "Will you give me a list of the *three best and longest keeping apples*, that you think will do well on a bed of loose gravel soil, from 10 to 30 feet deep, and which was originally covered with a heavy growth of white pine. It is a bench of land 10 or 12 feet above the river bottom, and in the center of our beautiful valley, 1194 feet above tide water. The hills gradually rise from 500 to 800 feet higher."

In answer to the above, we lay it down as an indispensable requisite, that the soil named by our correspondent is strong enough to grow good apple trees; and that the locality is sufficiently free from frosts, and the seasons long enough to permit the fruit to come to full maturity. These conceded, we name the Roxbury Russet, the Poughkeepsie Russet, and the Pomme Grise, which is also a Russet. All agree that these three kinds are the longest reliable keepers of any good apples grown here at the north. The Golden Russet, to our taste, is more delicate and delicious than either of the other Russets named, but by some it is not considered so late a keeper.

Tastes differ greatly in apples; and we wish it understood, that those most generally considered the *best* flavored, are not the *longest* keepers. The Swaar, Spitzenburgh, Baldwin, Northern Spy, Newtown Pippin, and Rhode Island Greening, are preferable to those we have named; but they are not so long keepers as the Russets, and are therefore precluded from the list required by our correspondent.

ON PRESERVING SEEDS FROM BIRDS.

As the time of year has now arrived for sowing seeds, it may be of some importance to know how to preserve them from being destroyed by chaffinches, greenfinches, and many other birds, as soon as they make their appearance above ground.

All gardeners know the difficulty of keeping these little intruders at a respectful distance from their seed-beds in spring. My plan of doing so is simple but effectual; with me it is no new discovery, having practised it with the greatest success for these last six years. I have tried it with vegetable seeds of all kinds that birds will attack. I prepare my seeds before sowing, and when that is done, I can follow any other part of my business without any further care, as far as birds are concerned. My plan is this: I have a flower-pan, a new painter's brush that has never been used for any other purpose, a bottle of turpentine, and a quantity of red lead; these are all kept together in a small basket, ready for use at any time when they are required. The seed-beds being ready, as much seed is put in the flower-pan as is required to be sown on each separate bed; a little turpentine is then poured on, and the red lead added; it is then well worked round the pan with the painter's brush until every seed has become thoroughly coated. Care should be taken in the first instance not to use too much turpentine, as it takes more lead than is necessary to dry it up again, in order to get the seeds well separated before they are sown. When seeds are well coated as above, the rain never washes it off, and it does not destroy the

vitality of the seeds in the least. I know that red lead was recommended for the same purpose some years ago; but used with water alone, I found it could not be depended upon. I have long known that birds do not like the smell of turpentine, but to test this knowledge I used two sorts of sawdust for the same purpose; one sort was from foreign deals which contained a large portion of turpentine, the other was from elm, and of course contained none; the birds did not at all like the former, but the last-named was not the least protection, as I have often seen them basking in it on a sunny day. This is the third year I have tried it with autumn-sown peas as a protection against mice; they have once or twice tried a row, but that trial, in all probability, cost them their lives. Of the peas I sowed last autumn not one has been touched, though I know that there are mice in the garden.—J. HOLLAND, in *London Florist*.

If the above process for protecting seeds is adopted, care should be taken to keep domestic fowls from access to the garden, lest they should be killed or injured by devouring any of the seeds so prepared.—EDS. AGRICULTURIST.

CULTURE OF THE CHRYSANTHEMUM.

PRACTICAL DIRECTIONS.

THE following practical directions for cultivating this beautiful flowering plant, are from Mr. J. SHEPARD, foreman in the gardens of Bath, (Eng.), and are found in the *Floricultural Cabinet*. The writer says:

I need scarcely advance any thing in favor of this beautiful autumn-flowering plant, as I feel confident those who are fortunate enough to have become acquainted with it, will not easily relinquish its culture; and those not already possessed of a collection, will find this an excellent time to make their purchase; for what can be a more salutary employment than cultivating the beautiful and bounteous gifts of our Creator? It is apt to lead a contemplative mind, in the language of Shakspeare, to

"Find tongues in trees, books in the running brooks,
Sermons in stones, and good in every thing."

We are principally indebted to our brethren on the continent for the many improvements made; likewise to our principal nurserymen for bringing them before us. Could we but get them to seed in this country, we should undoubtedly have a more numerous variety, and very likely possessing what in England are considered perfection in form. Their culture is so simple, that those of the humblest pretensions may indulge in it; a common garden frame being all that is requisite, in the way of glass, providing it is of sufficient depth for head-room.

The cuttings should be taken off about the first week in April; they may be either inserted in cutting-pans or thumb-pots. Preference should, however, be given to the latter mode, as they receive no check after re-potting. They should be partially filled with a nice rich mold, adding a little coarse sand on the surface, slightly damp them, and insert a cutting in each pot, plunging them in a nice bottom heat, keeping close till fairly rooted; after which give air gradually, till they become a little hardened. They may then receive a shift into pots known as large sixties; and if convenience will admit, they may again receive the benefit of a slight bottom heat; if not, keep them close for a few days, after which give air on all favorable opportunities. As soon as they have taken well hold of the soil, stop them to within a few joints of the bottom; this will be found to keep them bushy; shift them on as they become rooted into forty-eight sized pots, using *three* parts of a good strong fibrous loam, three parts to *one* part of well decomposed cow manure and a little sand. After potting, let them be plunged nearly to the rim of the pot, either in coal ashes or in the open ground, duly attending to them

with water; for if *once* permitted to become *dry*, their leaves will *turn yellow* (for want of this necessary attention how often do we see plants with long *naked* stems?) and eventually fall off. They must be shifted again, as soon as well rooted, into thirty-twos, or if *wanted large*, twenty-fours, using the same kind of compost; and if the *large flowered varieties* are grown, larger pots must be used. Let them be again plunged, after which little more will remain to be done, beyond supplying them with *manure-water* twice weekly, and clear water as they require it. Neatly stake them out, to prevent their being broken.

Very large plants may be obtained by planting them out early in the open ground, and taking them up *after setting their flower buds*. Care must be exercised in this operation, otherwise they will flag. Dull showery weather should be taken advantage of for this; pot in a good rich soil, and place them in the shade of a north aspect wall; and if not showery, frequently syringe them. I have grown the large-flowered varieties in this way without losing a leaf, and they were admired by all who saw them. If wanted for decorative purposes, in small pots, I recommend the Pompons (or Minimas,) propagated as late as August. They will form little gems for the drawing-room; and if a few pots of Mignonette are added, it will impart to the whole a charming fragrance, at once exhilarating and delightful.

The following descriptive list of kinds comprises what will give a striking variety, as well as containing most of the *best* out.

Pompons.—Drine-Drine, fine soft yellow; Bijou de Horticulture, creamy white; Atropos, crimson; Atala, fine rose; La Fiancée, white; La Lapajou, deep yellow center, edged with red; Sacramento, orange-yellow; Lais, crimson-purple; Graziella, rosy-blush; Madame Jules de Gory, white shaded with yellow; Perfecta, lilac; Adonis, rosy-purple. *Large flowered varieties*.—Temple de Solomon, fine yellow; Madame Poggi, crimson-chestnut; Nancy de Sermet, white; Queen of England, blush-white, fine; Princess Maria, rosy-lilas; Annie, canary-yellow; Pio Nono, mixed red or scarlet; Dupont de l'Eure, carmine orange; Jenny Lind, rosy-buff; Duke, blush; Campestro, plum-colored; Gluck, golden-yellow, fine.

DESTRUCTION OF PEACH TREE BLOSSOMS.—The *Portsmouth* (N. H.) *Journal* of April 1st, says that the cold of the past winter has been extremely destructive to the peach blossoms in that vicinity. Mr. D. H. Spinney, who has a large nursery, informs the editor that he cannot find a single bud which indicates a live blossom.

Mr. B. F. Butler, of Pelham, says that he examined his peach trees on the 22d of February, and was not able to find a single living bud. They were alive on the 16th of January.

JUDGMENT NECESSARY IN COOKING.

A PERSON devoid of judgment and palatal taste, cannot serve a savory meal, however abundant the material may be, or of whatever richness. A well-prepared dish will recommend itself to fastidious appetites, though plain in its ingredients, when one of luxury may be set aside from mismanagement in cooking. All the "cook-books" ever written, of themselves, never made a good cook; and these, joined with the requisite articles, in the hands of inexperience cannot produce a good dinner, the first, and most often overlooked requisite for which is, that the food be healthy.

As a community we have a horror of consulting physiological demands in regard to what and when we shall eat; and the consequences are that health, sound, robust, vigorous health, is rarely to be met with. When grains, fruits, vegetables or meats are used, let them be of good quality, neatly prepared, cooked the proper length of time; the intensity of heat being of great importance, and served when "just

right;" on these points there will be but little variation among good cooks, however, much they may differ in regard to seasoning. Many dishes are rendered indigestible and unpalatable by cooking too slowly, or by being overdone, or being kept warm when ready for the table, in consequence of too early preparation.

The importance of having each dish ready in season is known to all in the habit of serving good meals. Many things are equally palatable, whether eaten warm or cold; in fact, this depends almost wholly on habit, whereas there are few articles but what are greatly injured in the fineness of their flavor by being "kept warm." *Were more food eaten cold, more brains at least might have an occasional meal.*

A full view into the culinary arrangements of our homes, would in a measure solve the problem of the apparent famishing condition of the female intellect. When the palate is the worshipped idol, the mind must bow subservient to it, and soon becomes a degraded, famished slave. Not only the female intellect suffers, man's does scarcely less; he must first labor uselessly hard to procure dainty articles, and he then over-eats, which produces mental stupefaction by the demand the stomach makes on the vitality to enable it to discharge its heavy burthen.

As a relish among farmers, where it is usually to be found, I know of nothing more pleasant than sweet cream; and in the vast array of dishes to which it is adapted, I place it at the head. In use with sugar it forms a more dainty dressing for puddings, "short cakes," fruits of various descriptions, and various forms of prepared farina, than any or all other combination of sauces, and as a seasoning for vegetables it is almost indispensable. In the preparation of fish it is equally good. It is far more healthy than butter, into which it is rendered after much fatiguing labor, and therefore much cheaper. Remember I am writing for farmers, else I might feel guilty in holding a tempting bait to those who cannot reach it. For pies and cakes I would never use lard, and seldom butter, could cream be obtained, not strong cream, but fresh sweet cream—*sweet & sour* cream when necessary.—*Correspondent Michigan Farmer.*

SWEET.—Kissing a pretty girl (down south,) a young gentleman asked her "what made her so sweet?" "Oh," she replied, in utter ignorance, "my father is a sugar planter."

PERVENTIVE BETTER THAN CURE.—It is better to throw a guard about the baby's cradle than to sing a psalm at the bad man's death-bed; better to have a care while the bud is bursting to the sun than when the heat has scorched the heart of the unguarded bosom.

A MUSICAL VOICE.—A young man at a social party was urged to sing a song. He replied that he would first tell a story, and then, if they persisted in their demands he would try and execute a song. When a boy, he said, he took lessons in singing, and on Sunday morning he went into his father's garden to practise by himself. When in full play, he was suddenly sent for by the old gentleman.

"This is pretty conduct," said his father, "pretty employment for a son of pious parents to be *sawing boards on Sabbath morning*, loud enough to be heard by the neighbors. Sit down and take your book." The young man was excused from singing the proposed song.—*Del. Co. Republican.*

EVERY school-boy knows that a kite would not fly until it had a string tying it down. It is just so in life. The man who is tied down by half a dozen blooming responsibilities and their mother, will make a stronger and higher flight than the old bachelor, who having nothing to keep him steady, is always floundering in the mud. If you want to ascend in the world, tie yourself to somebody.

American Agriculturist.

New-York, Wednesday, April 12, 1854.

OUR PAPER of this week contains nearly *thirty* agricultural articles, about a dozen of which are editorials. It will also be seen that the greater portion of these are adapted to the season. The present number is a fair sample of what may be expected weekly. This is only the fifth number of the present volume, and we believe many of our readers think, as some have already said to us, "that they have received a dollar's worth in the first four numbers." Please, then do a little favor for your neighbor as well as for us, by acting as a voluntary agent in extending the circulation. Our friends have done nobly for us thus far, but we hope they will not cease their efforts. We are expending a very large sum annually on the *Agriculturist*, and it is to the little sums of one dollar and two dollars that we look for the means of meeting this outlay. We are quite sure we shall receive more than this, if you, and you, reader, will do what you conveniently can for us.

"PENNY WISE AND POUND FOOLISH."

NOT A FANCY SKETCH.

WE know a farmer who pays \$200 every spring for four tons of Peruvian guano, while he neglects an equal amount of fertilizing materials on his own farm, which he could gather for one-fourth of the money; and thus save annually at least \$150, by exercising a little thought.

We happened on his farm a short time since, and made the following notes:

Under his poultry roost lies full a ton of first-rate manure, dropped by sixty to eighty fowls, which he keeps the year round. There is a bed of this several inches in depth, which is nearly as valuable as the best accumulations upon the surface of the Chincha Islands.

The drain—into which goes all slops, including urine—opens out upon the road-side, at a distance from the house, where is a deep slough of odorous materials, of the very best character for applying to almost any crop, but which are allowed to go entirely to waste.

He burns hard coal, but uses several cords of wood during a year for kindling and hastening fires. All the ashes, because containing cinders, are thrown out into a corner of the garden, and we estimated the unsightly heap, which had accumulated for years, to contain several hundred bushels, one-fourth of which were wood ashes. Allowing only for the value of the latter, if unleached by rain, we would give \$25 to have that heap distributed over a small field of our own.

The privy is placed high, with no vault under it, but so that the excrements can be drawn out with a hoe in the rear, where they are washed away by rains and evaporate into the air during decay. A quantity of muck and plaster, occasionally thrown with these excrements, and the mixed mass gathered into a dry place, or applied directly to the soil where wanted, would give annually a dozen or more barrels of as good poudrette, as any sold in the market at a high price.

His barn-yard is so placed, that there is a constant washing out upon the lower side, of a rich, dark liquid; and the most valuable part of the manure from thirty head of cattle, thus runs into a low spot, where it sinks away into the soil, or evaporates into the air. A very few days' work with a plow and scraper, would change the bed of his yard, so that this waste would be entirely prevented, and this valuable fluid absorbed by the straw and a few loads of muck, which is easily procured, would be worth more than a hundred dollars per annum.

The manure of five horses, is thrown from the stable through a side opening, and lies for months steaming and evaporating, and exposed to the water from the eaves; and not till its virtue is three-fourths lost, is it drawn out and used upon the field. A small quantity of plaster and muck, or plaster alone, mixed with this heap, as new portions are daily added, and a few loose boards placed over it to shed off the rain, would have quadrupled its value.

At another time we will give additional notes from that same farm, which is not 20 miles from our office, and which is but a counterpart of thousands all over the country. The cost and cartage of a single ton of guano would have sufficed to save all the manure wasted in the ways we have indicated, which we could not estimate at less than \$200 or \$300 per annum.

PEA PLANTING.

THIS crop may be planted either in the fall or very early in the spring. But not much time is gained by the former process. The ground has been so constantly frozen throughout the northern portion of our country during the last half of March, that the vegetation of seeds was impossible. But now, that the birds begin to sing merrily, and the wild geese are wending their way to their summer quarters, no time is to be lost in putting in this crop.

The best four early peas that we have tried, are the Extra Early May, Early June, Prince Albert, and Early Emperor. About a week later is the Champion of England, which is the sweetest, and most prolific pea we have tested, either early or late.

The early peas do not have so strong vines as the Marrowfats, and need not be planted so far apart, and do not require so high brush. We usually plant them in double drilled rows, the drills ten inches apart, and the rows four feet. The pea is one of the lime plants, its straw showing a large per cent. of that constituent. Maximum crops can only be grown in common garden soils, by the application of lime, in some form. The best crop of peas we ever raised, was with home-made super-phosphate of lime. The growth of vines was large, the pods thick set, and well filled, and the peas of very fine flavor.

The comparative merits of deep and shallow planting is still a question among gardeners. Some plant a foot deep, especially in fall and early spring, and claim that the peas do not dry up so quick, and bear much longer. We never plant more than an inch deep, considering that the main advantage of deep planting is the loosening of the soil. We trench very thoroughly, and have never had reason to suspect that the roots of the pea did not penetrate downward, wherever they could find the way.

This is a very profitable crop in the vicinity of cities and villages. Immense quantities are brought to this city from the south, and distributed through the cities and villages of New-England, long after the season of peas in our climate. Tens of thousands of dollars, every summer, are paid for this article, withered and next to worthless, that might as well be paid to our neighbors for a fresh wholesome article.

GET SPRING CROPS IN EARLY.

THERE is a great advantage in sowing and planting early. Taking one season with another, there is less risk from frost than from dry weather in the latter part of spring, or the early part of summer. Some crops can be re-sown, if a chance cold, wet spring should destroy the first sowing.

We sowed a field of marrowfat peas three weeks sooner than usual, and they came forward so early that we sold them green in the pod, for more than fifty dollars an acre over the expense of picking and carrying to market, and in addition had a moderate crop come to maturity.

Early potatoes always bring a good price in any location. A plot of these planted as soon as the frost is out of the ground, will be quite likely to produce a little extra "change" just when it will be very convenient, to say nothing of the luxury of having early new potatoes for home use. Should the first planting happen to be destroyed, the use of the ground need not be lost.

TOP-DRESS YOUR WINTER WHEAT.

WE would recommend those who have fine manure on hand, to give a small coating of it to wheat at this season, especially on land that is not already rich. If the manure has been well rotted, most of it will wash into the soil, and give the wheat a good start, which is important at this season. Guano, if at hand, will be found valuable for this purpose. It is better to mix it well with muck or finely-composted manure. A good plan is, to sow it just before, or during a gentle rain; a very heavy rain would wash portions of it away.

We would especially urge farmers to try some experiments at this season. These will cost less than a *good* analysis of their soils, and furnish more conclusive and valuable information. Select a few lands of wheat, and scatter over one of them some guano, on another ashes, on a third salt, on a fourth super-phosphate, on a fifth plaster, on a sixth lime, on a seventh nitrate of soda, on an eighth bone dust, on a ninth compost manure, and on other plots put combinations of two or more of these. Leave undressed-lands between each of these; keep an account of the kind and amount of the fertilizers added to each plot; and note the apparent effects during the growth, the time of ripening, and also the plumpness and quality of the grain at harvest. Similar experiments could also be made in planting and sowing the various other crops.

A part, or the whole of these experiments, will cost but little time or expense, and will give the intelligent farmer much pleasure in observing the effects, to say nothing of the valuable information that may thus be gained, for the future guidance of himself and neighbors.

Numerous carefully-conducted experiments

by the best English agriculturists, indicate that where a pretty heavy top-dressing is to be added, it is better to divide it into two or three portions, and add them at successive periods of three or four weeks; say a part early in April, a part in the last week of April or first week in May, and the remainder about the latter part of May. By this course, the successive wants of the crops are provided for.

TAKE GOOD CARE OF BREEDING ANIMALS AT THIS SEASON.

It is very bad economy to neglect breeding animals at this season. It is too common a practice among farmers to neglect the care of brood mares for the last month or two before foaling. Their food is often of a very inferior quality; currying is neglected; they are turned loose in the yard to pick up hay and straw that has been trampled under the feet of cattle, or if kept in stalls, the manure is not thoroughly cleaned. Care of this kind is mainly bestowed upon the work horses. The same may be said of cows and ewes.

This is all wrong. Animals in this condition should be treated with special care instead of neglect. If well fed and well cared for, their young will be doubly valuable, and the dams will much more speedily recover their strength and vigor after parturition, and they will be worth far more during the entire summer. We have seen many dams become so reduced at this season for want of a little care, that they have hardly recovered before the following winter.

RENOVATING OLD MEADOWS.

Much land is suffered to lie almost dormant and unproductive, for the want of a little skill and expense. Especially is this the case with old meadows, which, for various considerations, have been allowed to remain in grass for a number of years without undergoing the usual rotation.

The most effectual method of treating these, is to drag them thoroughly with a fine-toothed harrow, *heavily weighted*; or what is very much better, a *scarifier* made exclusively for this purpose, consisting of a number of small sharp coulters, regularly arranged for penetrating the sod, at proper distances, and to a depth sufficient to break up the tangled mass of roots and stools, and let in the sun and air. This treatment of the meadows is frequently just as necessary, and just as beneficial, as trimming fruit trees; and the effects of this simple operation alone, has been found to double and quadruple the crop.

If to this, however, could be added at the same time, an application of lime, ashes, guano, phosphate of lime, or other fertilizers, with a small sprinkling of grass seed, such as were deficient in the crop, an additional and large benefit would be secured.

"KEEP OFF THE GRASS."

ALL around the walks of our city parks we see posted up in flaming capitals, "Keep off the grass." We should like to see one of these placards put near every farmer's cattle yard at this season, with a little alteration, so that it would read, "keep the cattle off the grass." It is a pretty sure sign of bad management, if animals

are seen roaming over the fields, before the grass is so forward as to furnish an abundance of food. So long as they are kept entirely away from tasting green food, animals will not lose their relish for the dry. But let them out for a few hours, or suffer them to crop by the wayside as they are driven to and from water, and for hours after they will scarcely touch their dry food.

Tramping upon the fields before the ground has been thoroughly settled, is very detrimental to the future growth of grass. The first shoots are tender and are easily killed, while they contain little nourishment compared with an equal weight or bulk of more advanced growth. It is economical to purchase dry food for a week or two longer, and let vegetation get a good start before an animal sets foot upon it.

FIELD BEANS A PROFITABLE CROP.

In our own experience we have found no crop more profitable, than the common white field bean. It requires little more care than corn; on the right kind of soil it is quite productive; and almost always finds a ready market at high prices. There is no product of the soil which contains as much nourishment, pound for pound, as this. The straw makes excellent winter feed for sheep. We have found the smaller kinds to be superior to those of a larger size.

Beans require a *dry, warm* soil. We have raised them where it was so dry and sandy that scarcely any thing else would grow. Our best bean crops have been upon a thin sandy soil, so filled with stones that it was exceedingly difficult to plow it at all; and where the earth over the limestone rocks was nowhere more than four to six inches deep. On one acre of such ground we planted the common white bean for ten years successively, and never failed of getting a remunerative crop, and often had a very profitable one. This plot was plowed, planted, and hoed, at odd spells, when it was so wet that no other ground could be worked.

A SPRING JOB FOR THE BOYS.

SCATTERED all over the pasture fields are small heaps of cattle droppings. Which should not be left to spoil the ground they cover. Fix out the boys with a small beetle, or long-handled mallet, and send them into the pastures, and they will have fine sport in knocking to pieces and scattering about these cow heaps. No labor of our boyhood days was more pleasant, than the week or two thus spent every spring.

A very convenient implement for this purpose can be made in less than half an hour. Saw off a piece of square scantling, 5 to 8 inches long, and bore a slanting auger hole in one side, and fit in a handle $2\frac{1}{2}$ to 3 feet long. The handle can be made of a broom stick, or broken hoe or rake handle. This should be set into the top of the block at such an angle, that when held in the hands of the boy standing upright, the bottom of the block will lie flat upon the ground, twenty or thirty inches from his feet.

A NUT FOR LAWYERS.—"Woe unto them that call evil good and good evil; that put darkness for light and light for darkness; that justify the wicked for reward."—Isaiah.

Boys' Corner.

EDITOR TO THE "BOY FROM DOWN EAST," AND OTHER BOYS.

In the letter we published last week, you have doubtless already found many mistakes. We shall leave you to find them out, but we will say a word or two about the sentiments expressed in that letter. We are very sorry the writer does not like to study. He would like to have a great mind, and we will tell him that a great mind is built up very much like a great building. The builder uses many kinds of materials. He puts in a brick here and a brick there; in one place he puts a piece of wood of one shape, and in another place a piece of another shape. Here he puts mortar, and there he drives nails. He works slowly and patiently till he gets the whole finished. Just so every one must *build* his own mind. He must study many things slowly and patiently, till he has piled up a mass of thoughts, when he will become learned and know a great deal.

The mind must be made *strong*. You have seen that little boy who is always kept in the house without exercise. How pale and sickly he appears. How *weak* he is. The boy that is always out working or exercising grows strong. When a boy first tries to hold a plow, he cannot keep it straight, but he does not give up. When the plow strikes a stone and throws him over, he hops up and tries again and again, till his arms acquire strength, and till he becomes so skilful that he can plow a straight, smooth furrow as well as his father.

Now thinking is just like plowing. The boy who tries to work out a problem, or learn any lesson, finds it hard work at first. The lesson bothers him, makes him tired, and he makes as awkward work at first, as the new plow-boy. But he must keep at it, and not be discouraged. It takes a good many years to learn to plow well, and just so it takes a good many years to learn to think well, and how much better to be a good than a poor thinker. It is the ability to think correctly and strongly, that makes the difference between great men and others.

We remember when we first tried to write a composition. We tried and tried two whole days, and only wrote two pages—and then those two pages had many more mistakes in them than the letter printed last week, which covered more than three pages of writing. We got tired many times in trying to write that first composition, and a good many others after it, and we would have given up, if our teacher had not *made* us write. We could not then see what use it would ever be to learn how to write down our thoughts, and we did not believe we ever could learn; but we did learn, and now we are very, very thankful to our teacher for compelling us to write.

We do not think teachers should give too long lessons, but we guess they do not always require boys to learn their lessons well enough. A short lesson learned well, is better than a longer one poorly learned. But boys, remember that the longer lessons you learn, the faster your minds will grow. Studying a long lesson is to the mind, what a large plate of buckwheat cakes is to the body, it makes it grow fast.—The boy that wrote that letter, did not ask us to

write to the cook to give him a small plate of tates, lest his body should grow too fast.

We advise him to go to college by all means, if his father will let him. The writer of this did not get a chance to go till he was more than twenty-one years old, but he is now very glad he did go. We can till a farm better now than we could if we had not been through college; for we learned to *think* a great deal better; and now we can think better how to cultivate the land, and how to take care of our crops, and cattle, &c. Sometime we may tell you how we became editor. We will now say that we began to learn when we were no older than "A Boy from Down East." On page 323 of volume Eleven of the *Agriculturist*, we told the boys a little about the way we learned to write at first, by keeping farm accounts.

And now, boys, we will close this chapter by saying that we should like to have you write for the *Agriculturist*. We will have a Boys' Corner, whenever you will have something to put into it. Read over the directions to correspondents in our paper, and also remember to write only on one side of the paper, when you write for a printer.

Miscellaneous.

For the American Agriculturist.

RECOLLECTIONS OF OUR FIRST EXPERIENCE IN FARMING.

BY LUCY GLENDON.

I HAVE read with pleasure and profit the articles of your fair correspondent, MINNIE MYRTLE, and have often wondered that more of the American ladies do not relate their various experiences through the columns of the *Agriculturist*. Next to wondering at the vacuum in this necessary department, came conjectures as to my own fitness for the task of filling it, and I finally arrived at the conclusion of at least making the trial. This idea was partly suggested by turning over the pages of an old diary, kept during a residence in one of the very fairest of all the sunny Southern States, which vividly brought back to memory the pleasant little chances and mischances that attended our first experiment in farming.

Yes! it was our first experiment and our last. Twelve years had we spent in a large city, confining our amateur agriculture to a garden. Small as it was, considered in square feet and inches, I believe no garden ever yet displayed such a multiplicity of talent. Melons, sweet corn, fruit trees, roses, dahlias, pinks—all the inhabitants of the vegetable world, were admitted, and so successfully did we wage war against insects, frosts, and all the ills that garden-flesh is heir to, that it inspired no small triumph, together with a certainty that we were born to figure in a larger area of ground.

Of course, all our dreams of a farm were composed of lowing herds, nightingales, strawberries and cream, and "neat-handed Phillises," and the lovely aspect of the Southern woods and fields, as they first met our eyes, clad in their gorgeous autumnal robes of gold and crimson, contributed to heighten this agreeable delusion.

Our first and last farm, consisted of a hundred goodly acres, only about two and a half of which were ever cultivated. The house itself was situated in one of the most perfect groves ever planned by the fertile brain of Nature. A noble old chestnut, that had probably waved for half a century, formed the apex, from which sloped down oaks, evergreens, and sturdy forest trees, in irreproachable symmetry.

Shall I ever forget the ludicrous misadventures that attended these two years. My father, the very beau-ideal of a *book-farmer*, (as the veteran farmers of the neighborhood, entirely guiltless of all modern innovations, regarded him,) piled his book-shelves with bound volumes of the *Agriculturist*, *Cultivator*, &c., and with these guides entered on a life of practical agriculture. Heaven help us! for all he knew about it! Request of him the derivation of a knotty Greek verb, or the translation of a passage in Virgil or Euripides—question him regarding the geological formation of a country, or seek an explanation of the metaphysical subtleties of Aristotle or Kant, and he was in his element. None could converse more clearly, or sustain an argument with more ability on these points, than he. But as to sowing and reaping, the veriest farm-boy in New-England, had the advantage of him. So out he went every morning and hoed a row or two of corn, and then returned to the shady verandah to read Wordsworth, or pore over the enchanted pages of Coleridge, while Cesar, the stout negro man, sowed potatoes, and told a long story to the children of the household, between every hill. Of course, this was all very pleasant, so far as the present was concerned; but the days and weeks rolled by, and the corn and potatoes didn't seem to thrive in spite of our scientific experiments. The pigs (Cesar's special protégés) escaped from their confinement, and galloped wildly around, to the manifest detriment of vegetation. So Cesar was told to fasten them up again, and in this visionary attempt every child in the house, scoured from pillar to post, until their delinquent pigships were safely ensconced within their proper dominions. Cesar tied up the refractory rails with a piece of string, (his never-failing expedient,) and went his way until the next onslaughts upon the young vegetables, called the children's hunting propensities, and Cesar's piece of string, again into requisition.

And now to relate our first experiment in butter-making. This article had become very expensive, and our cows yielding many quarts daily of rich milk, we saw no earthly reason why we, practical agriculturists that we were, should not manufacture our own butter. To be sure we had no churn, but necessity is the parent of invention, and our dear mother, whose command of expedients was truly surprising pressed a shallow earthen jar into the service. It was filled with cream, and Susan, the maid, was armed with a stout iron spoon, wherewith to agitate it briskly.

After about two hours' toil, Susan reported the cream as still obstinate. "Oh, you haven't stirred it enough," said my mother, and one of the juveniles was set to work at the rate of a penny an hour. I will not relate the exact order in which the whole domestic force succeeded one another. Suffice it to say, that the shades of night surprised us, but not—the *butter*.

At length our dear impracticable father, with

a bright idea, no doubt borrowed from the "Philosophy of Human Life," (the book then in hand,) suggested SALT! Oh, dawn of light on the darkness of our despair? To be sure! Was not butter always salt? and how were we, in our ignorance, to know at what stage of the operation it was applied? A table-spoonful of salt was incorporated with the nondescript mass under the hands of Susan, and we waited with breathless impatience to see the golden island emerge from the sea of buttermilk. All, however, was in vain. More salt—hot water—cold water, were applied in quick succession—the mass was whirled round with renewed vigor, but no butter made its appearance.

Just then, in walked a friend and neighbor, whose whole life had been spent under the shadow of a farm-house, and before her we laid all these troubles. I will not repeat the bursts of laughter with which our various schemes were greeted, nor the good-natured witticisms she indulged in at our expense, but I will say, for our own credit, that before we left that Southern home, we could make as good butter as any in the country—Latin and metaphysics to the contrary, notwithstanding.

All these little mishaps were certainly supremely ridiculous, and very vexatious at the time; but nevertheless, many were the happy hours we spent within the precincts of that farm. Petting the chickens and peacocks, and stroking the last new calves for the children—roaming through solemn pine avenues to the song of summer birds, book in hand, to the dear father; transplanting roses and shrubbery to our flower-loving mother, and the happy sunsets where we all sat together in the verandah, surrounded by beloved guests, who came from time to time to view our new domains—these made our lives pleasant. I shall never forget those summer twilights, with the heavy odor of blossoming, locusts floating on the air—the solemn stars ascending their thrones of light one by one, and the whip-poor-will chanting her melancholy refrain in the distant wood—*and as long as memory continues to weave her bright shadows amid the soft tints of the past, these reminiscences of our sweet Southern home, will hold a beloved place in the sanctuary of the heart.*

THE QUAKER'S SCRUPLES.—A Quaker said to a gunner, "Friend, I counsel no bloodshed; but if it be thy design to hit the little man in the blue jacket, point thine engine three inches lower."

The above reminds us of an anecdote we have heard or read somewhere, of an occurrence on board an American merchant vessel, which was attacked by a British privateer during the last war. A Friend on board had refused to assist in defending the vessel, as it was entirely against his peace principles to shed blood even in self-defence. The privateer's men had taken to their boats, and were attempting to board the vessel. The Friend stood looking calmly over the bulwarks as one of the attacking crew sprung from the boat and seizing a rope that chanced to hang down, commenced climbing up the ship's side. The Friend took up a hatchet lying near, and addressing the man, who was now suspended over the water, said: "Friend, if thee wants that rope, thee can have it;" and suiting the action to the word, he severed it just above his hands

TERRIBLE ENGINES OF DESTRUCTION.

TO BE USED BY THE ENGLISH FLEET SENT TO RUSSIA.

The following article is from the French correspondent of the *Cincinnati Gazette*. If the terrible engines of war described by him, prove half as effectual as represented, it will be mere boy's play for the combined English and French fleets in the Baltic and Black Seas, to destroy all the Russian ships afloat. War is a dreadful evil, and terribly destructive to every thing good. How much better would it be for humanity, if the means employed for destruction, were turned to the advancement of agriculture, and the moral and intellectual culture of mankind.

The new invention for the more rapid destruction of human beings, which the war is bringing to light, especially in England, will surpass all expectations. The arsenals of England have for a long time been closed to visitors, even to the members of Parliament, while these new and terrible machines were being constructed and experimented upon, and no knowledge of their existence even was permitted until now called forth by actual service. Many years ago the English Government had a proposition before them to adopt Wagner's floating gun, and hesitated. A member of Parliament exclaimed: "He demands but £300,000, and yet you hesitate! Hasten to buy this machine, declare war against France, and you will destroy her marine in a few days time!" No attention was paid to this apostrophe at the time in France, and apparently none in England. But this terrible invention, of which the public has ceased to talk, and which was even ridiculed at the time, has been maturing in concealment in the arsenals of Woolwich, and is now ready to go out on its work of destruction.

The Count Lavalette, captain of military marine in France, who knew the construction of this gun, it is said made endeavors to have it adopted by the minister of marine under Louis Philippe. It is simply a long Congreve gun, which glides along on the water in a straight line till it strikes the vessel at which it is directed, when it thrusts into its sides its iron head, containing two pounds of fulminating powder of mercury. When the fire attains this reservoir, it explodes, blowing a hole in the vessel ten or twelve feet in diameter, which it is impossible for them to close up, as they do the round holes made by cannon balls.

In admitting that the Russian fleets shall retire under the inapproachable fortresses of Cronstadt and Sebastopol, they cannot be in safety from this terrible Congreve gun, which carries to almost any distance within reach of the aim, and far beyond the reach of any other gun. It cannot be prevented from passing through the most contracted straits where ships pass.

The submarine boats are so perfected at this moment, that they can reach and attach a burner to an enemy's ship without the least danger. Experiments are also being made with an asphyxiating ball, which does not kill, but which paralyzes an entire crew for several hours, or until they are made prisoners. They are embarking also a large number of burning explosive balls, which explode invariably when they strike, even in the body of a horse, for they inflame at the moment of discharge from the gun, and fly burning like small Congreves until the moment of explosion, when they may apply fire to the ammunition chests and other inflammable material, as easily and as surely as if they were to fall in a stubble-field.

They are furnishing also two small steam-boats of a singular appearance, which will carry only two enormous Paixhan guns, placed on the fore part of the vessel. The walls of these little vessels have a thickness of six feet, made of oak, standing upright, and this covered with a mattress of cotton substance, a foot and a half thick, which is impenetrable to a bullet, and this again covered with a sheeting of iron and

lead. Its prow has the angular form of a cuirass, intended to turn bullets; the roof or deck is covered in the same way, so as to allow the bombs to glide into the sea without doing damage.

The fire-ship—very heavy, and a bad sailer—will be towed and let loose at the proper moment, to approach near the enemy's vessel, either when at anchor or lying to, which it will attack fore and aft with bombs thrown between wind and water, and sprinkling the ship with a shower of Grecian fire. One of these burners, taking by surprise a fleet of vessels in a calm, could with ease destroy the whole fleet, and yet it only requires the labor of ten determined men to operate it.

The Peace Society have agitated the question in England of how far a nation is justified in employing other and more destructive methods in war than those employed by the enemy. Admiral Napier has replied to these propositions with irony: "If you fear to hurt the enemy, put into your guns balls of cotton, and into your cannon cakes of rice!"

The English fleet is largely provided with balloons, intended to carry inflammable materials to scatter over towns, villages, and fleets, when the wind favors such operations.

Another invention, still more terrible than all the rest, but of which the construction has not yet been made known, except to a very small number of persons, is about to be sent out to destroy the Russians. All these inventions are highly curious and interesting in the history of the war, but rather afflicting for humanity.

—♦♦♦—
GONE RIGHT OVER IT.—I have a friend, whose ready wit often enlivens the social circle, and sometimes, also, faithfully serves the cause of truth. One Sabbath morning, as he stepped from his house to go to church, he met a stranger driving a heavily-loaded wagon through the town. He turned upon him, stopped, lifted both hands, and stood in a tragic attitude, gazing upon the ground beneath the vehicle, and exclaimed, "There! there! you are going right over it! You have gone *right over it*!" The traveler hastily gathered up his reins, drew in his horses, came to a dead stand, and began looking under his wheels to see what little innocent child, or dog, or pig, might have been ground to jelly by their heavy weight. But seeing nothing, he looked anxiously up to the man who had so singularly arrested his progress, and said, "Over what?" "The fourth commandment," was the quick reply, "Remember the Sabbath day to keep it holy." It was hard starting those wheels again, and hard hauling that load all the rest of the day.—*Norwich Examiner*.

—♦♦♦—
UNANIMITY.—"We must be unanimous," said Hancock, on the occasion of singing the Declaration of Independence; "there must be no pulling different ways." "Yes," answered Franklin, "we must all hang together, or most assuredly we shall all *hang separately*."

A GENTLEMAN who did not trust to his memory wrote in his pocket-book: "I must be married when I get to town."

THERE is a phrenologist in Philadelphia, who can tell the contents of a barrel, by examining its head.

DOGS vs. MINISTERS.—If we may believe the census, every fifth person in the United States owns a horse; and every tenth a dog. And it costs more to support the dogs than it does the ministers!

"I REMEMBER," says Lord Biden, "Mr. Justice Gould trying a case at York, and when he had proceeded for about two hours, he observed:

"Here are only eleven jurymen in the box; where is the twelfth?"

"Please you, my Lord," said one of the eleven "he has gone away about some other business, but *he has left his verdict with me!*"

GETTING ON TOO FAST.

A pious old slave had a wicked master. This master had much confidence, however, in the slave's piety. He believed he was a Christian. Sometimes the master would be serious and thoughtful about religion. One day he came to the old slave, with the New Testament in his hand, and asked if he could explain a passage to him. The slave was willing to try, and asked what it was.

"It is here in Romans," said the master.

"Have you done all it tells you to do in Matthew, Mark, Luke, and John?" inquired the slave seriously, fixing his eyes upon his master's.

"No, I haven't" said he.

"Then you're getting on too fast—too fast, master. Go back to the beginning of the book. Do all it tells you, till you get to Romans, and you will understand it easy enough then; for the good book says, 'If any man will do my will, he will know the doctrine.'"

If any of our readers ever heard any body arguing about a hard text in Romans, or somewhere else, and worrying to know what it means, just tell him this story about "getting on too fast."—*Juvenile Instructor*.

SPECIAL NOTICE TO ALL SUBSCRIBERS.

We find that by using such good paper, our volume of 832 pages will be quite large to bind, and especially large for those who wish to stitch their paper together with an index, without being at the expense of binding. To obviate this, we have concluded to be at the expense and trouble of making out an extra index with No. 26, so as to form a complete volume of the first 26 numbers. The index for the next 26 numbers will be given at the end of the year, or with No. 52. This arrangement will make it convenient for all, as the 52 numbers can be stitched or bound in two volumes with an index for each, or in one volume with the double index at the close.

We hope all will preserve their numbers, for there are many single articles each of which will be worth the price of the volume, for future reference. When the paper arrives from the post-office, a good plan is to see that it is properly folded, and then pin or sew it through the middle and cut open the leaves. It is very easy to stitch 26 numbers together. To do this, arrange them in regular order, and with an awl punch several holes about one-fourth of an inch from the back, and through these run a strong thread two or three times with a darning-needle, and the work is done. We have scores of volumes of papers, pamphlets, and addresses, thus prepared, which serve all the purposes of a bound volume, and occupy less room in storing and carrying. We would, however, prefer to see volumes of agricultural papers neatly bound and laid upon the book-shelves or tables of farmers. They are much better and more appropriate ornaments, than gilded volumes of trashy magazines or novels.

ONE WORD MORE.—We thank our friends for the liberal aid they have afforded us in extending the circulation of the *Agriculturist*. Our list has increased beyond our expectation, and we are daily encouraged to labor with the utmost diligence, to make our paper worthy of the confidence and admiration of our largely increasing list of readers. Our reliance for the continuance and increase of our list is upon those who are already readers. As stated above, we now divide the year so as to give either one or two complete volumes of the 52 numbers. Number 27 begins the second volume, or half of the year. We respectfully request all our present subscribers to make a little exertion at this time, and each send us on at least one new name. If you cannot get your neighbors to send on for a year, ask them to try the paper for six months, as in that time they will get a complete volume.

To CORRESPONDENTS.—We have several communications on hand which we will look over as soon as we have time, and some of them will be published. It is no trifling labor to prepare for the printer many communications which we receive. Some are written so closely that there is not room to put in corrections, without re-writing the whole. We cheerfully prepare articles, unless there is manifest *want of care* on the part of the writer. If he does as well as he can, we make all needful changes and corrections.

As most writers doubtless wish to improve their own style, we suggest to them to keep an exact copy of their communications, and then compare this copy with the printed sheet. They may often learn something in this way.

We are not anxious to receive original poetry. We have little space for rhyme, and we have good selections enough to last us a year at least. Good poetry, however, will not be rejected; but we advise all who attempt to write in verse to remember, that good *rhyme* does not constitute *good poetry*; on the contrary, some of the best *poetry* we have ever seen does not "*rhyme*" at all, while some of the best *rhyme* contains not a single *poetic* sentiment.

THEY WERE NEVER CHILDREN.—A correspondent says: "We talk of Adam and Eve as having been, before the fall, in a very happy condition, but one thing they missed—they were never children."

True. We never thought of that. Adam never played marbles. He never played "hokey." He never drove a tandem of boys with a string. He never skated on a pond, or played "ball," or rode down hill on a hand-sleigh. And Eve, she never made a play-house; she never took tea with another little girl from the little tea-table set out with the toy tea things; she never rolled a hoop, or jumped a rope, or pieced a baby-quilt, or dressed a doll. They never played "blind man's bluff," or "pussy wants a corner," or "hurly burly," or any of the games with which childhood disports itself. How blank their age must have been, wherein no memories of early youth came welling up in their hearts, no visions of childhood floating back from the long past, no mother's voice chanting a lullaby to the ear of fancy in the still hours of the night, no father's words of kindness speaking from the church-yard where he sleeps. Adam and Eve, and they alone of all the countless millions of men and women that have ever lived, had no childhood.—*Albany Register*.

QUEER SHIRT BUTTONS.—"What on 'arth ails these ere shirt buttons, I wonder. Jest the minit I put the needle through 'em to sew 'em on, they splits and flies all to bits." "Why, Grandmother, them isn't shirt buttons, they's my peppermints, and you've been spilin' 'em."

NECESSITY is great for making things serve all round. In California a warning-pan is used as an umbrella, fruit-dish, bean-pot, and-contribution-box.

Markets.

REMARKS.—Our advices from Europe are to the 25th March. Grain and Flour have fallen there considerably, but this decline has not affected our market in the least, owing to the small quantity on hand. At the opening of the canals, when large quantities will be continually coming to market, the prices will then be governed more by those prevailing in Europe. Flour remains nearly as per our last; Corn has fallen 3 to 4 cents per bushel.

Cotton has given way from $\frac{1}{2}$ to $\frac{3}{4}$ cts. per lb., Sugar $\frac{1}{2}$ of a cent.

Money is just as high as ever, and Stocks a little lower.

The weather has now become quite mild and

spring like; but the season is at least twelve days later than that of last year.

From the Mark Lane Express, March 20th.

REVIEW OF THE BRITISH CORN TRADE.

THE depression in the Wheat trade has in no degree abated since our last, and a further important decline has taken place in prices at most of the leading provincial markets. Holders appear to have been seized by a kind of panic; whilst buyers, finding it to their advantage to hold off, have refused to take beyond what they have needed for immediate use. In proportion as the anxiety to realize has increased, so has the caution of purchasers, and so far from any improvement in the demand having been caused by the fall which has taken place in prices, the effect has been just the reverse; for with each concession made by sellers, the millers have contracted their operations. How long this state of affairs may continue, no one can foresee; but it is an undoubted fact that stocks in the hands of the millers and bakers have been materially reduced, and, whenever the turn may come, the reaction is likely to be sudden. That the existing position of affairs has been in a great measure brought about by the increasing tightness in the money market, cannot be questioned; and, though there has been no great extent of speculation, still purchases were, it would now appear, made during the time that prices were on the advance, by parties not in a position to hold what they bought for any lengthened period; hence the late forced sales. Circumstances have, it must be confessed, been all against speculators for an advance. We have, in the first place, been favored with the most auspicious weather. The autumn seed-time was all that could be desired; the winter sharp, but not protracted; and the weather for getting in the Lent crops as propitious as possible. There has, consequently, been nothing to create uneasiness in respect to the future, and, though it may not be very rational to conclude that because the first step has been favorable the result must also be so, still it has encouraged hopes of future abundance.

The prospect of war with Russia, which greatly assisted the upward movement, has, now that it has become almost certain, had the opposite effect, inasmuch as it has caused the Baltic merchants to make unusual efforts to ship off all they could as early as possible; with this view vessels have been loaded over the ice, and the latter cut away, so as to allow the ships to proceed to sea before the winter broke up. The pressure for money, to which we have already alluded, may also be attributed to the extraordinary expenditure caused by the preparations of war; and though there can be no doubt that we shall hereafter feel the effect of the withholding of supplies from Russia, thus far the warlike aspect of affairs has been to depress, instead of raising, prices. Last, but not least in importance, has been the extent of the arrivals of breadstuffs from America. These had certainly exceeded what we were led to expect, from the character of the advices from thence; for we were told months ago that stocks at the ports on the sea-board had been reduced into a very narrow compass, and that the receipts from the interior would be comparatively unimportant. The question now is, will America continue to ship as largely as she has done; will the prohibition of exports from the Black Sea, and the interference with supplies from the Upper Baltic, have no effect; and will the consumption, which was certainly checked by the high prices which prevailed during the winter, undergo no increase after a fall of 10s. per qr. on Wheat? The answer we must leave to our readers. During the last month there has hardly been a day in which out-door labor could not be favorably prosecuted; farmers have, consequently, been enabled to make rapid progress, and the sowing of Lent Corn is now drawing to a close; indeed in many districts the work has been finished. Still the deliveries from the growers have not increased materially.

CONTINENTAL CORN TRADE.

We learn from the Baltic that the different rivers and harbors had been freed from ice, and that the greatest activity prevailed to ship off what had been bought during the winter for English account. The very dull reports from hence had had the effect of checking all inclination to enter into fresh engagements, and what was being done was in fulfillment of contracts previously entered into.

By the most recent advices from France, it appears that the pressure for money had not diminished, and the downward movement in prices of Wheat and Flour had consequently continued. The dull accounts from hence, and the favorable character of the season, had all assisted to discourage holders, and the anxiety to realise at almost any price had amounted to a panic. At Paris on Wednesday, sellers would have submitted to materially reduced rates; notwithstanding which, it was impossible to induce buyers to act. We have similar advices from Havre, but at Marseilles a rally seems to have taken place on receipt of the information of the prohibition of exports from Southern Russia; subsequently, however, business had again become dull.

From Odessa we learn that the time allowed for vessels to complete their loading had been extended to the 13th March. So soon as this had become known, a very active demand for Wheat had set in, and over 70,000 qrs. had been bought for immediate shipment.

PRODUCE MARKETS.

Wholesale prices of the more important Vegetables, Fruits, &c., at the principle New-York Markets.

April 8, 1854.

VEGETABLES.—Potatoes, Western Reds, $\frac{3}{4}$ bbl., \$2 37 $\frac{1}{2}$; Junes, \$2 25; Merinos, \$2 25; Carters, \$3 50; Mercers, \$3 25; Onions, red, $\frac{3}{4}$ bbl., \$1 75; yellow, \$1 75; white, \$3; Parsneps, $\frac{3}{4}$ bbl., \$1 50; Beets, $\frac{3}{4}$ bbl., \$2 50; Carrots, $\frac{3}{4}$ bbl., \$2 50; Turnips, white, $\frac{3}{4}$ bbl., \$1 75; yellow, \$1 50; Spinach $\frac{3}{4}$ bbl., \$4; Celery, $\frac{3}{4}$ doz. bunches, \$2; Lettuce, $\frac{3}{4}$ doz., 25c.; $\frac{1}{2}$ doz., \$1; Vegetable Oysters, \$1 @ \$1 25; Cabbage, $\frac{3}{4}$ hundred, \$8 @ \$14.

FRUITS.—Apples, Greenings, $\frac{3}{4}$ bbl., \$3 50; Spitzenburgs, $\frac{3}{4}$ bbl., \$3 50; Russets, $\frac{3}{4}$ bbl., \$3 50; Northern Spy, $\frac{3}{4}$ bbl., \$4, a very few in market. Second quality of the kinds above mentioned are worth \$2 @ \$2 50; Cranberries, $\frac{3}{4}$ bbl., \$9 @ \$10; Maple Sugar, per lb., 10 @ 12 $\frac{1}{2}$ c.; Eggs, $\frac{3}{4}$ doz., 15c.; Butter, 18 @ 22c. per pound.

The markets are poorly supplied, and produce is commanding good prices at present.

NEW-YORK CATTLE MARKET.

Monday, April 10, 1854.

The number of cattle in market to-day is not as large as one week since, but they are of a superior quality, about equal to those of last week. The prices range about the same as last week.

Lowest price, 8c.; Middling, 9c.; Best, 10c.

Washington Yards, Forty-fourth street.

A. M. ALLERTON, Proprietor.

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY
Beeves, 2,187	2,187
Cows, 29	
Sheep, 476	
Swine, 1,095	
Veals, 907	

Of these there were forwarded by the Harlem Railroad, beeves, 88; cows, 27; sheep, 405.

By the Hudson River railroad, beeves, 700; sheep, 71.

By the Erie railroad, beeves, 1100; swine, 1095.

SCARIFIERS FOR OLD MEADOWS.—AN INVALUABLE machine for rousing moss and the old flag from hide-bound meadows and renovating their grasses. To be drawn by one or more horses. [31-41] R. L. ALLEN, 191 Water street.

KETCHUM'S IMPROVED MOWING MACHINE WITH entire change of gear. The only successful mower now known.

Ketchum's Improved Machine, which we are building for the harvest of '54, was thoroughly tested last season, and the advantages gained by our change of Gear are in all respects as we designed, viz: durability, convenience and ease of action. The shafts now have bearings at both ends, which overcomes all cramping and cutting away of boxes. A counter balance is attached to the crank shaft, which gives it a steady and uniform motion. Each Machine can be thrown out of gear; there is great convenience in getting at each and every nut, all of them being on UPPER SIDE OF THE FRAME; oil cups are attached to all the bearings, which, by the use of a wad of cotton, will hold oil for a long time, as well as protect the bearings from dust, grit, &c.; the finger bar is lined with iron its full width, which protects it from wear.

These and various other additions for strength, durability &c., makes them the most simple and perfect agricultural implement in use. They weigh about 750 lbs. each, and can easily be carried in a one-horse wagon.

They will cut ALL KINDS OF GRASS, and operate well on uneven or rolling lands, or where there are dead furrows. This Machine took the highest award, with SPECIAL APPROPRIATION, at the World's Fair, it also received, during last season, one silver and four gold medals, and various other flattering and substantial testimonials of approval. We have spared neither pains nor money to make them deserving of public favor, and hope to be able the coming season to supply the great and increasing demand.

We take this occasion to caution farmers against buying UNTRIED Mowers, if they do (as was the case with many last year) they incur loss, vexation and disappointment.

In all cases where Extras are wanted, be sure to give us the NUMBER OF YOUR MACHINE.

(WARRANTY.) That said Machines are capable of cutting and spreading, with one span of horses and driver, from ten to fifteen acres per day of ANY KIND OF GRASS, and do it as well as is done with a scythe by the best of mowers.

All orders filled by the subscribers. Office and Shop, corner of Chicago street and Lombard Canal, near the Eastern R. R. Depot, in Buffalo N. Y. HOWARD & CO.,

Manufacturers and Proprietors,

For Sale by R. L. ALLEN, 189 Water street, N. Y.

The Mower is also manufactured by Ruggles, Nourse, Mason & Co., at Worcester, Mass, for the New-England States. By Seymour, Morgan & Co., Brockport, N. Y., for Illinois, Iowa and Michigan. By Warder & Brokaw, Springfield, O., for Ohio and Kentucky. 31-39

FRESH GARDEN AND FLOWER SEEDS OF ALL THE BEST VARIETIES. Also a choice collection of GREEN-HOUSE and GARDEN PLANTS, &c. For sale at A. BRIDGE-MAN'S HORTICULTURAL ESTABLISHMENT, Nos. 874 & 878 Broadway, above 18th street, New-York. Garden & Greenhouses, Astoria, L. I. 26-33

TREES AND PLANTS.—PARSONS & CO., FLUSHING, near New-York, offer for sale their usual assortment, with the addition of many rare novelties of Fruit Trees, for the Orchard and the Garden; Ornamental Trees, Shrubs, and Roses, for the Avenue, Lawn, or Cemetery; Vines for the Grapery, and Exotic Plants for Greenhouse culture. O. M. SEXTON, 102 Fulton street, N.Y.

NEW AND CHOICE FRUITS.

Hovey & Co., No. 7 Merchants Row, Boston have the pleasure of offering to amateur cultivators and the trade generally, the following superior new fruits, of which they possess the entire stock, and are now first offered for sale:

BOSTON PEAR.

A new native summer variety, ripening from the middle to last of August, just before the Bartlett, of large size, with a beautiful waxen yellow skin, and a red cheek, superior to any variety of its season.

This fine pear was first exhibited by Messrs. Hovey & Co. before the Mass. Hort. Soc. in 1843, and repeatedly since that time, obtaining the highest commendation of the Fruit Committee, who have spoken of it as follows:

"From Hovey & Co. a new native pear, of good size, fair and handsome, of a brisk vinous flavor, fully equal to an Urbaniste in its best condition, and one of the finest early pears."—Report of Aug. 1850.

"The Messrs. H. & Co. have also presented this season a native variety of great beauty and of fine quality, which promises to rank among the best of our early pears."—Hon. J. P. Wilson, of the Horticultural Society, 1851.

In 1850, the Mass. Hort. Soc. awarded Messrs. H. & Co. the premium to the variety, as the best summer pear.

In 1853, the Mass. Hort. Soc. awarded Messrs. H. & Co. a gratuity of \$20 for the introduction of this variety.

Fine trees of large size, 5 feet high, will be ready for sale on the 1st of April next, at \$5 each. A few trees of very large size, full of flower-buds, \$10 each.

HOVEY CHERRY.

This new and superb Cherry was raised from seed by Messrs. H. & Co., and is one of the largest and most beautiful cherries known. It measures more than an inch in diameter, and is produced in clusters of twenty or thirty cherries each. The color is amber, beautifully shaded with deep coral red. It is firm, sweet and rich, ripening in the last of July and beginning of August. It is beautifully figured in the Fruits of America. It first fruited in 1848, and has obtained the following commendatory notice:

"One of the best, if not the very best new cherries tasted the past season, 1851, was a Seedling of Messrs. Hovey. It was of the largest size, sweet, high flavored, and very fine. The present indications are that it will take a high rank, and become an established favorite."—Mr. CABOT'S Report, 1851.

On the 17th July, Messrs. H. & Co. produced their Seedling Cherry, mentioned in the preceding report. This, notwithstanding the unfavorable season, fully maintained the high character then awarded to it."—Report of Fruit Committee, 1852.

The committee awarded Messrs. Hovey & Co. the APPLETON GOLD MEDAL for this variety, it having proved, for five consecutive years, a new and superior cherry.

Young and handsome trees of this superior cherry will be ready for sale the 1st of April next, at \$4 each.

CONCORD GRAPE.

MR. BULL'S NEW AND SUPERIOR SEEDLING. This remarkably fine American variety is the greatest acquisition which ever yet been made to our hardy grapes, and supplies the desideratum so long wanted, of a prior table grape, sufficiently hardy to withstand the coldest climate, and early enough to ripen its fruit in any part of the Northern or New-England States. It is FOUR WEEKS earlier than the Isabella, and two weeks earlier than the Diana. It was fully ripe the last season (1853) on the 3d of September, when Messrs. Hovey & Co. exhibited specimens from Mr Bull's original vine before the Massachusetts Horticultural Society.

It is a most vigorous growing vine, perfectly hardy, with bunches of large size, handsomely shouldered, often weighing a pound, and with large roundish oval berries, frequently measuring an inch in diameter; color very dark, covered with a thick blue bloom; flesh free from all pulp; flavor very rich and luscious, with a fine sprightly aroma. The foliage is large, broad, and thick, and the berries have never been known to mildew, rot, or drop off under any circumstances, during the five years since it has borne fruit. All good judges who have tasted it pronounce it far superior to the Isabella in its ripest conditions.

Opinions of the Fruit Committee of the Mass. Hort. Soc. 1853, Sept. "Seedling grape from E. W. Bull; large, handsome, and excellent."

1853, Sept. "Fully equal to specimens last year, and proves to be a remarkably early, handsome, and very superior grape."

Fine strong one-year old vines will be ready for sale April 1, at \$5 each, and to the trade, at \$40 per doz. All orders will be attended to in the rotation in which they are received.

SALE OF STOCK.

PURE BRED STOCK AT PRIVATE SALE AT MOUNT FORDHAM, Westchester Co., New-York, Eleven Miles from City Hall, N. Y., by Harlem Railroad Cars.

Having met with more success than I anticipated the past year, with the Catalogue of male animals at Private sale, is the reason for offering this lot of animals. AND MY JUNE SALE BY AUCTION, WILL NOT TAKE PLACE. A full descriptive Catalogue with prices attached, will be published on the fifteenth of April, and I intend to set at home myself to secure who may care. I will sell at private sale, about 18 Short-Horns, 6 of which are young Bulls and Bull Calves. The Cows and Heifers old enough, will be in Calf, to the Celebrated Imported Bull "BALCO" (9918) or Imported, "ROMEO," winner of the first Prize at Saratoga, in 1853; and also at American Institute the same year.

The young Bulls and Bull Calves, are some of them from imported Cows, and sired in England; and others are sired by the famous Imported Bulls, (Champion) winner of the first Prize at Saratoga, the past year, as a two year old.

Also, about 10 head of Devons, consisting of a yearling Bull, sired by MAJOR, and 5 Bull Calves, sired by my imported first Prize Bull, FRANK QUARTLY, and several of them from imported Cows and Heifers old enough, will be in Calf to FRANK QUARTLY. Also 6 or 8 Suffolk Sows; and several young Suffolk and Essex Boars. Also, 2 South-down Rams, imported direct from Jonas Webb; and 6 Yearling Rams, all bred by me, from Stock on both sides, imported from Jonas Webb. Catalogues will be forwarded by Mail if desired.

All Animals delivered on SHIPBOARD, or RAIL CAR in the City of New-York, free of expense to the purchaser. The Devons are at my Herdsdale Farm, 12 miles north, to which place I will take persons both to and from.

MY FRIEND MR. N. J. BECAR, who is interested in several of my importations, will also sell about 10 head of Short-Horns, consisting of 4 young Bulls, and 6 or 8 Females. These young Bulls are also several of them from imported Cows, and sired by the LORD OF ERYHOLMNE (12305), and the celebrated first Prize Imported Bull ROMEO. Mr. Becar's Cows and Heifers are in Calf to the imported Bull, MARQUIS OF CARRABAS (27890). Mr. Becar can be seen at his Store, No. 187 Broadway, New-York, at which place he will make arrangements to go to his Farm, at Smithtown, Long Island. His animals will be entered in the same Catalogue with mine, which can be obtained by addressing him at his Store, or me at Mount Fordham. His animals will be delivered in the same manner as mine. Our importations have been in almost all cases made at the same time, and are of equal merit, excepting that I have more in number.

TERMS, Cash on delivery.

March 16th, 1854.

29-37

LOP-EARED RABBITS OF IMPORTED STOCK (Price \$10 per pair,) for sale by S. PARSONS, Flushing, L. I.

CLARK, AUSTIN & SMITH,

NO. 3 PARK ROW, and NO. 3 ANN STREET, HAVE RECENTLY published new editions of the following books:

NORTON'S SCIENTIFIC AGRICULTURE. Elements of Scientific Agriculture, or the Connection between Science and the Art of Practical Farming. Prize Essay of the New-York State Agricultural Society. By John P. Norton, M.A.

CATECHISM OF AGRICULTURAL CHEMISTRY AND GEOLOGY.

By James F. W. Johnston. With an Introduction by John P. Norton. 26-29-31-32

MORRIS FEMALE INSTITUTE.

THIS INSTITUTION IS SITUATED AT MORRISTOWN, N. J., about an hour and a half's ride from the city of New-York, on the Morris and Essex railroad; the cars leaving New-York several times a day. It has been ably patronized for the last six years. There will be a vacancy for a few more pupils in April.

Faithful teachers are provided for English branches usually required; also Drawing and Painting. French, Latin, and Spanish under a native teacher.

Vocal and instrumental music, by an accomplished player, whose time and attention has been for years devoted exclusively to this object.

Further particulars, and circulars, may be obtained by applying to J. A. SEELEY, Principal, or at the book-store of Messrs. C. Shepard & Co., 152 Fulton street, near Broadway, or at this office.

Persons wishing to send their daughters from home, would do well to visit this Institution before deciding.

27-31

WILLARD FELT, NO. 191 PEARL STREET, (NEAR Maiden Lane), Manufacturer of Blank Books, and Importer and Dealer in Paper and Stationery of every description. Particular attention paid to orders.

26-77

Catalogues now ready.

26-83

NO. 1 SUPERPHOSPHATE OF LIME.—THIS VALUABLE fertilizer has been used for several years in England and other parts of Europe, and next to Guano, holds the highest rank in popularity, and the extent to which it is used among farmers. Its introduction in this country has been more recent; but the progress it has made in the estimation of the public has not been less marked or successful than abroad. It is now extensively used throughout the Northern States, after a full trial and investigation of its merits; and it is rapidly becoming, like its predecessor, Guano, a favorite manure at the South and West.

It is composed of crushed or ground bones, decomposed by the addition of about one fifth their weight of sulphuric acid, diluted with water, to which is added a due proportion of guano and sulphate of ammonia. The latter is the active and one of the most efficient agents in the best Peruvian Guano.

It is suited to any soil in which there is not already a full supply of the phosphates, which is seldom the case. All crops are benefited by its application.

For sale in large or small quantities, in bags of 150 lbs. each. No charge for packages. All bags will be branded "C. B. De Burgh, No. 1 Superphosphate of Lime."

PERUVIAN GUANO of best quality.

AGRICULTURAL and HORTICULTURAL IMPLEMENTS of all kinds.

FIELD and GARDEN SEEDS, of various sorts, fresh home grown and imported.

THE AMERICAN AGRICULTURIST—weekly, \$1 per volume—two volumes a year.

For sale at **R. L. ALLEN'S** Agricultural Warehouse and Seed Store, 189 and 191 Water street, New-York. 25-1f

FOR SALE AT THE SOUTH NORWALK NURSERY, THE Great New Rochelle or Lawton Blackberry Plants; also plants of the White fruited Blackberry. For sale also a large stock of small plants of the new or North River Red Antwerp plants, at the low price of fifteen dollars per thousand. The above plants all warranted.

GEO. SEYMOUR & CO., South Norwalk Nursery, Conn. 24-36

ATKINS' SELF-RAKING REAPER.—40 of these machines were used last harvest in grass or grain or both, with almost uniformly good success, in nine different States and Canada.

TWENTY-SIX PREMIUMS, including two at the Crystal Palace, (silver and bronze medals,) were awarded it at the autumn exhibitions. I am building only 300, which are being rapidly ordered. Mr. Joseph Hall, Rochester, N. Y., will also build a few. Early orders necessary to insure a reaper.

Price at Chicago \$175—\$75 Cash with order, note for \$50, payable when reaper works successfully, and another for \$50, payable 1st December next with interest. Or \$160 cash in advance. Warranted to be a good Self-Raking Reaper.

Agents properly recommended, wanted throughout the country. Experienced agents preferred. It is important this year to have the machines widely scattered.

Descriptive circulars with cuts, and giving impartially the difficulties as well as successes of the reaper, mailed at request. Applications to **G. S. WRIGHT**, "Prairie Farmer" Warehouses, Chicago, Feb., 1854. 23-35

POUDRETTE.

THE LODI MANUFACTURING COMPANY offer their Poudrette for sale in lots to suit purchasers, from a single barrel up to 4000 barrels, at their usual rates, \$1 50 per barrel for any quantity over seven barrels, delivered on board of vessel in the city of New York, free of cartage or other charge. When 200 or 300 barrels are taken, a deduction will be made from the above price. That this article has stood the test of fourteen years trial is proof of its efficacy. It is the cheapest and best manure for corn ever produced, and it has the advantage of being useful in small quantities and harmless in large. It is a capital manure for peas, strawberries, &c., and all garden vegetables. Apply by letter or personally to the Lodi Manufacturing Company.

22-34 14 Cortlandt st., New-York.

GARDENER FOR THE GREEN-HOUSE AND GRAPE-HOUSE.—Wanted a Gardener as above, who is experienced in the management of the Green and Grape-House in the United States. None need apply except fully qualified. 22-1f **A. B. ALLEN**, 189 Water-st.

EARLY EXCELSIOR POTATOES.—THIS IS A NEW AND Every superior sort. They are as early as the June potatoes, grow above the average size, are mealy and palatable, and have kept better than any other variety planted in this vicinity. The rot has never been known among them. 26-1f **R. L. ALLEN**, 189 & 191 Water st., N. Y.

GARDEN IMPLEMENTS.

HEDGE, LONG-HANDLE, AND SLIDING PRUNING SHEARS; Budding and Edging Knives; Pruning Hatchets, saws and knives; pruning, vine and flower scissors; bill and Milton hooks; lawn and garden rakes; garden scufflers, hoes of great variety, shovels and spades; hand engines, which throw water forty feet or more, syringes and water pots; grafting knives, tree scrapers, and caterpillar brushes; transplanting trowels, reels; hand plow and cultivator, very useful to work between rows of vegetables, together with a large assortment of other implements too numerous to mention. [21f] **R. L. ALLEN**, 189 and 191 Water-st.

MEN AND BOYS' CLOTHING. AT WHOLESALE AND Retail—cheaper than ever, at **J. VANDERBILT'S**, No. 81 Fulton street, New-York. A very large assortment of all qualities and sizes; also a splendid assortment of fashionable goods, which will be made to order in a style that cannot be surpassed. Also India rubber clothing and furnishing goods. Your patronage is respectfully solicited. 2-30 **J. VANDERBILT**, 81 Fulton street.

AGRICULTURAL IMPLEMENTS.

AGRICULTURAL IMPLEMENTS—THE SUBSCRIBER keeps constantly on hand, and offers for sale the following valuable implements:

Grain Mills of various kinds, for rice as well as wheat, rye, &c. Grain Drills, a machine which every large grain planter should possess. They are of the best patterns, embracing most valuable improvements.

Smut Machines, Pilkington's, the most approved for general use.

Hay and Cotton Presses—Bullock's progressive power-presses, combining improvements which make them by far the best in use.

Grain mills, corn and cob crushers, a very large assortment of the best and latest improved kinds.

Horse Powers of all kinds, guaranteed the best in the United States. These embrace—1st. The Chain Power, of my own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, and economy. They are universally approved wherever they have been tried. 2d. The Bogardus power, for one to four horses. These are compact, and wholly of iron, and adapted to all kinds of work. 3d. Eddy's Circular Wrought Iron Power, large cog-wheels, one to six horses, a new and favorite power. 4th. Trimble's Iron-Sweep Power, for one to four horses. 5th. Warren's Iron-Sweep Power, for one to two horses.

GRAIN MILLS, STEEL AND CAST IRON MILLS, AT \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES—FOR MAKING DRAINING TILES OF all descriptions and sizes.

WATER RAMS, SUCTION, FORCE, AND ENDLESS-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL KINDS, MADE EXPRESSLY for the California and Oregon Markets.

DRAINING TILES OF ALL FORMS AND SIZES.

CLOVER AND TIMOTHY SEED HARVESTER.—A newly-patented machine, will harvest 10 or 12 acres per day with one horse.

HAY AND COTTON PRESSES.—BULLOCK'S PROGRESSIVE Power Presses, combining improvements which make them by far the best in use.

THRESHERS AND FANNING-MILLS COMBINED.—OF Three Sizes and Prices, requiring from two to eight horses to drive them, with corresponding horse powers.—These are the latest improved patterns in the United States.

SOUTHERN PLOWS.—Nos. 10 1/4, 11 1/4, 12 1/4, 14, 15, 18, 18 1/2, 19, 19 1/2, 20, A 1, A 2, 50, 60, and all other sizes.

CORN-SHELLERS, HAY, STRAW, AND STALK-CUTTERS.—Fanning-Mills, &c. of all sizes.

HAIR RESTORERS, &c.

BAKER'S CHEVEUXTONIQUE.—THIS IS AN ENTIRELY new article, concocted for the purpose of Preserving, Restoring, and Beautifying the Hair, and, unlike most preparations designed for the same objects, it is free from all grease, so that its application cannot soil the most delicate fabric. As an eradicator of Dandruff, it is unequalled, while its infallibility in cases of headache, easing the most violent in a few moments, cannot fail to commend it to universal appreciation. The Cheveux-tonique is for sale by all the respectable druggists and fancy stores throughout the city. The depot for its sale, wholesale and retail, is at **BAKER'S LADIES' Hair-dressing Establishment**, No. 439 Broadway. 2-48

HORTICULTURAL.

ISABELLA GRAPE VINES,

OF PROPER AGE FOR FORMING VINEYARDS, OULTI- vated from, and containing all the good qualities which the most improved cultivation for over fourteen years has conferred on the Croton Point Vineyards, are offered to the public. Those who may purchase will receive such instructions for four years, as will enable them to cultivate the grape with entire success, provided their locality is not too far north. All communications addressed to **R. T. UNDERHILL**, M. D., New-York, or Croton Point, Westchester Co., N. Y., will receive attention. The additional experience of two past seasons, give him full assurance that by improved cultivation, pruning, &c., a crop of good fruit can be obtained every year, in most of the northern, and all the middle, western, and southern States.

N. B. To those who take sufficient to plant four acres, as he directs, he will, when they commence bearing, furnish the owner with one of his vine-dressers whom he has instructed in his own mode of cultivation; and he will do all the labor of the vineyard, and insure the most perfect success. The only charge a reasonable compensation for the labor. 23-31. **R. T. U.**

FRUIT AND ORNAMENTAL TREES AND PLANTS.—Including every thing necessary to the Garden, Green-house, Nursery, and Orchard, with all the recent introductions, at very low rates. Descriptive price Catalogues gratis. Carriage paid to New-York. Ornamental and other planting done in any part of the country. The best season for transplanting is after Oct. 10. Address **B. M. WATSON**, Old Colony Nurseries, Plymouth, Mass. 8-59

New-Orleans, A. Robb, 24 Bank Place. 2-43

MANUFACTURES.

RANGES AND HEATERS.—I AM NOW PREPARED TO supply those in want of a Cooking Range with one that is not only economical, but combines more conveniences for boiling, baking, &c., than any other in use. Also, the Etna Heater, for warming houses of any size. Apply to **A. McPHERSON**, No. 233 1/2 Water street. 2-40

FISH HOOKS AND FISHING TACKLE, NEEDLES, &c.—**HENRY WILLSHER**, Manufacturer and Importer of Needles, Fish-hooks and Fishing tackle, consisting of Limerick and Kirby salmon, trout, bass, pike, perch and other Hooks; Salmon, Lake, and Trout Flies; Cork and Wood Floats; Flax, Twisted and Plaid Silk, Chinese Grass Hair, and Cable-laid Lines; Bowed, Swivel, Hollow, and Plain Sinkers; Flax and Silk Lines ready for use; Silk-worm Gut; Snells; Double Twist, and Single Gut Leaders; Spoon Bait; Squids; Multi-plying and Plain Reels, Nets, Artificial Fish; Walking-cane and other Rods; Lolley's and Chambers' Sail Needles; Pack and Willsheir's superior Sharps and Between Needles, &c. Cheap for cash, in lots to suit purchasers, at No. 9 Cedar street, New-York. N. B.—Orders per mail or otherwise promptly attended to. 2-40

MISCELLANEOUS.

GREENWICH POTTERY, 261 WEST EIGHTEENTH street. Steam-pressed Vitrified Drain Pipe, from three to eighteen inches in diameter, and in two feet lengths. The best and cheapest medium for drainage and sewerage ever yet offered to the public. The subscriber is the exclusive manufacturer of steam-pressed Drain Pipe in this country, and he offers it to the public on as favorable terms as the ordinary drain pipe made or sold in this city. 2-27 **WASHINGTON SMITH**.

WHOLESALE FISH STORE.—500 BBL'S SALMON, 2000 bbl's Mackerel, first quality, 3000 Small Packages Mackerel, 200 bbl's New Shad, 500 hals Shad, 1000 bbl's New Herring, 300 hals New Herring, 1000 quintals New-Dried Cod-fish, 500 Jars New Anchovies, 500 Kegs New Dutch Herring, 2000 Boxes New Smoked Herring, 3000 lbs. New Smoked Salmon, 500 Kitts New Soused Salmon, 500 Kegs New Spiced Herring, Sword-Fish, Blue-Fish, Pickled Cod, Haddock, Halibut, White-Fish, Sturgeon, Trout, Dun-Fish, &c.

For sale by **NELSON WELLS & CO.**, 81 Dey street, between Washington and West, New-York. May 13th, 1852. **NELSON WELLS**, 1-52 **S. H. WOOD**.

SEEDS.

SEEDS.—TIMOTHY; RED AND WHITE CLOVER; BLUE Grass; Orchard Grass; Bay Grass; Red Top; Sugar Corn; Peas; Beans; Turnip; Cabbage; Beet; Lettuce; Onions; Radish; Squash; Oage Orange; Large Yellow Locust, and all other kinds of field and garden seeds. Also Rhubarb Roots; Asparagus Plants, &c. **R. L. ALLEN**, 189 and 191 Water street.

STOCK.

IMPROVED STOCK OF ALL KINDS.—HAVING HAD great experience in breeding and raising the stock for the past twenty years, I offer my services to my friends to procure it of the best and most reliable kinds. As much notice as convenient is at all times desirable previous to purchasing, as it takes time to make good selections. Early in August or September is the best time to purchase for the South.

Short Horn or Durham cattle, Devons, Herefords, Alderney or Jersey and Ayrshires. Long-wooled Sheep—the Cotswold, Oxford, Leicester, Bakewell and Lincoln Mutton Sheep—the Southdown. Fine-wooled Sheep—such as the Saxon, Spanish, and French Merino.

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, which are spurious. 1-1f **A. B. ALLEN**, Nos. 189 and 191 Water street.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master, and ask him to mark the envelope, *Registered by* —, *P. M.*

Back Numbers are usually kept on hand, and when a subscription is sent without naming any date for commencing, the back numbers from the beginning of the current volume will be sent, unless as sometimes happens, an unusual rush of subscribers has exhausted the supply.

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In writing, always give the Post-office (instead of the town) and the County and State. *Write these very plainly.*

Clubs may add to their number at the same rate per copy as was paid by the original members.

Those wishing their papers changed from one office to another, should give the name, county, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished with Harper's Magazine, one year for	\$4 00
" Putnam's do do do do	4 00
" Knickerbocker do do do do	4 00
" Eclectic do do do do	6 00
" Little's Living Age do do do do	6 50
" National Magazine do do do do	3 50
" Dickens's Household Words do do do do	3 50

Address ALLEN & CO.,
189 Water street, New-York.

J. A. GRAY, Printer, 95 and 97 Cliff street, N. Y.

PUBLISHERS' ANNOUNCEMENT!

Twelfth Volume of

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B. The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon *its own merits*; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammeled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDN, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers,	-	-	-	\$2.00 a year,	\$2.00
" Clubs of 3 do.	-	-	-	1.67 "	5.00
" do. 5 do.	-	-	-	1.60 "	8.00
" do. 10 do.	-	-	-	1.50 "	15.00
" do. 20 do.	-	-	-	1.25 "	25.00

The money always to accompany the names for which the paper is ordered.

The Post-Master, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Post-Master, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, *Weekly Tribune*, or *Weekly Times*, or any other paper or periodical in this city, not costing to exceed two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if enclosed and mailed in the presence of the Post-Master.

Communications for the paper should be addressed to the Editors; subscriptions, advertisements, and all matters relating to the business department, should be addressed to the Publishers,

RAISING POTATOES—PREVENTIVES AGAINST ROT.

WE were recently informed by the proprietor of one of our largest hotels in this city, that he is paying *five dollars per barrel* for potatoes, and that by contract for his entire supply of not less than twenty-five barrels per week. A paying price this, one would think, for an article which, intelligently cultivated, will yield from 75 to 200 barrels per acre. But we must add, that this large price is due principally to the extensive rot, which so generally prevailed last season.

The prevention of this blighting curse—the potato rot—how shall it be accomplished? A great desideratum truly, and one that has engaged the sage and the simple, the philosopher and the peasant, for the last ten years; yet apparently with no more success than that for squaring the circle, or the transmutation of metals. A thousand suggestions have been made, and ten thousand experiments tried, and yet no solution of the enigma.

We shall attempt to offer no panacea for this disease, but simply suggest some of the circumstances in which fine crops of potatoes have been secured, when adjoining fields have been sadly blighted, or wholly failed.

And first of seed. Fields have been found to escape rot when seed has been early dug, (perhaps before being fully ripe,) and exposed for a time to the sun, then buried in a layer of sand, mold, or ashes, in a dry, cool cellar, and each bulb separated from the other. A better way, it is claimed by some, is to leave the potatoes in the hills where grown, under a covering of straw, as a protection from frost.

2d. The use of an old, well-drained meadow, rich in vegetable mold, freshly upturned, and without the addition of putrescent or barn-yard manures, has been found one of the safest precautions against rot.

3d. If a resort is had to recently-tilled fields, the mineral manures only should be applied to the land, such as lime, plaster, salt, ashes, or perhaps bone dust, or its substitute, super-phosphate of lime; or it may be guano, in limited quantity, intimately mixed with the soil. If a resort is had to stable manure, it should be thoroughly rotted previous to applying it.

In all cases, only dry soils should be used. The planting of early potatoes is one of the best safeguards against rot; and early digging and safely storing in dry, cool places, is a good precaution against disease.

A word as to planting. Let the ground be

thoroughly and deeply plowed. The use of the sub-soil plow can never be injurious, and is generally beneficial for preparing the ground not only for a potato crop, but for all others. By this means a depth of earth is secured for the range of the fibrous roots, to supply them with abundant and wholesome food—not confining them to the inert or effete superficial soil, a thousand times previously used; a ready escape is afforded for the surplus water of heavy rains, which, followed by the intense heat of summer, is, in our opinion, one of the most efficient causes of rot; and in case of drought an abundant supply of moisture is secured for the continued growth of the crop.

If the soil be light and dry, and especially if inclined to sand, we recommend planting so as to leave a level surface when the seed is buried, nor would we recommend much hilling in their subsequent cultivation. If the soil be heavy, wet, or inclined to clay, we advise planting near the surface, and throwing the earth over the seed, and hilling them in the process of hoeing afterwards.

But especially do we urge upon farmers the great utility of selecting the most hardy varieties of seed, and such as experience has shown to be least susceptible to disease. Such varieties are to be had, and those who wilfully or indolently neglect to procure them, deserve the loss which they might have possibly avoided.

THE NATIONAL POULTRY SOCIETY.—No. 2.

WE are not going to talk now of fowls as economical things, or as a branch of domestic or farm stock. This question, we take it, has been, from time immemorial, settled in the affirmative. For present purposes we are content to consider them as an amusement, an ornament, as a subject of beauty, of interest; and as a *study* for the leisure hours of the country resident, or the town, or city resident either, if opportunity favors their keeping. Nor are we about to find fault with, or to criticise the taste of any one in the selection of a variety, or of the several varieties that he may keep; although we frankly confess that we never affected the monstrous Asiatic fowls that are at present so highly popular. We admire the medium-sized, and more graceful birds, that show finished breeding and high quality, as we would prefer the refined and blood-like Arabian to the huge Clydesdale or the Conestoga draught-horses. Such, however, is only individual opinion, and the wherefore need not, at this time, be discussed.

The great show at Barnum's, contrary to general expectation, brought out altogether the finest, largest, and choicest exhibition ever witnessed in America. Of their kinds, there were

scarcely a pair of inferior birds in the collection—and many fowls came five hundred miles for the occasion. This very fact shows that the poultry fanciers within striking distance of New-York, had confidence in the Society, in its managers, in the ability of Mr. BARNUM to carry it out, and in his integrity to do what he promised. So far all was well—as of course it should be.

As an evidence of the interest felt among the fanciers of all ranks, and all fortunes, except the really low and worthless, (not an individual of these, have we learned, that made an offering for the occasion,) they sent their birds, generally attended themselves, and took a lively interest in every thing that appertained to the proceedings. We saw highly distinguished scientific gentlemen, lawyers and statesmen of great repute, grave divines,—“wise with the lore of centuries,”—merchants, and commercial men,—called by way of eminence, “millionaires,”—artizans, farmers, men of no occupation,—sometimes styling themselves, by way of notoriety, “gentlemen;”—singly, and with their wives, and daughters, and little children, all eagerly threading their way through and by each other, themselves constituting a crowd, or stopping to gaze at the coops and cages; intent on seeing every thing, examining carefully a great many birds, and holding spirited talks at various points and angles of each of the great halls where the chickens were congregated; and not once only, but repeatedly, day after day during the show, did we see some of the same individuals, groups, and families.

Now this means something. People would not congregate at this inclement season, from fifty to five hundred miles distant, to witness a “Chicken Show” in New-York, unless there was “something in it.” *There is something in it.* There is a study in it; a subject for investigation; a delightful contemplation in natural history, to speculate upon the almost numberless varieties that are produced, and their beautiful, harmonious arrangement of plumage, shape, and all the wonderful qualities they possess. They are a thing to love, to interest young minds, and old ones too, who have enough of the natural left in their artificial thoughts to appreciate any thing. They are among the things which make country life interesting, and attach people to home, and make it pleasanter to them than all the world beside. It shows, too, that the world *is* growing better in domestic feeling and home attachment—that little things are worth looking after, and although of no great magnitude, that one had better feel interested in a chicken, goose, duck, or pigeon, than not to be interested at all—and children, and young minds, if not amused by

innocent things, will surely become interested in vicious ones.

We never see a coop of fowls on their travels at the express office, but it gives us a sensation of pleasure. We know that some one is going to be made happy when the chickens arrive—for a time at least—and that *improvement* is thought of in the neighborhood of their proposed sojourning.

To breed a good chicken, pigeon, duck, goose, turkey—a good animal of any kind—requires thought, skill, observation, study, genius. Not so much of either, perhaps, as to be a finished sculptor or painter; but *breeding perfect models* in form, grace, plumage, is an accomplishment in the fine arts, as well as to perpetuate their similitudes in marble, or fix them on canvases.

Ho, then, for the Poultry Society! We give it the right hand of fellowship, and wish it unbounded prosperity. No longer will the production of our beautiful improving feathered companions be confined to decayed spinsters and crippled serving-men; but, elevated, counted at their worth, appreciated as things of beauty and of taste, they will take their due position with the noble horse, the stately Short-horn, the sleek Devon, and all the other favored creatures of the farm. In rearing and training them into the matchless perfection which our late exhibition has demonstrated they are susceptible, our young boys can improve their leisure hours, learn that their homes, although retired, have charms to attract them over all other places, our daughters have beautiful objects to look upon, and a new source of interest and happiness be created for the whole household.

Written for the American Agriculturist.

REMINISCENCES OF A FARMER'S DAUGHTER.

No. V.

BY MINNIE MYRTLE.

THERE came a change in the old farm-house, as I said, and she who was installed as its presiding genius, was a lady of the olden time, one who would have made a good heroine in the days of the revolution, or have won a crown in the days of martyrdom.

Living at the time she did, she was only a farmer's wife, but I have thought sometimes, that she was not the less a martyr, for the revolution which she effected, required a hero's courage and a martyr's fortitude. A house and a family were to be revolutionized. She must bring order out of chaos, and establish discipline and good government, where all had been confusion. Those who doubt the inventive and creative genius of woman, should have seen how bare walls and gloomy recesses were made bright and genial, under her transforming hand.

Her husband, though a man of excellent sense, and right ideas upon many subjects, and though an old-fashioned substantial man, had some old-fashioned notions upon the rights and privileges of woman, which would be discreditable to the dark ages. He thought—and oh, how many I have known who thought likewise—that it was no part of a woman's right, or privilege, to know her husband's income, or any thing concerning the state of his business

affairs. He meant to be very kind and indulgent, but it was such an indulgence as is bestowed upon a valued and faithful servant. His wife toiled; yes, performed more labor in one week, than he did in a month, but unlike a good servant she had no control over the wages which should have been the reward of her toil. "A woman should not have the disposal of money;" and when the butter and cheese which she had made were sold, not a penny was considered hers, to spend as she pleased. It all went into the coffers which were kept locked by a very stern hand. This is a sort of bondage to which many women are subjected, and it is a most cruel and oppressive bondage, such as should not be imposed upon a galley-slave. It destroys confidence and crushes affection. We cannot love those whom we do not trust; and it is equally impossible to love those who do not consider us worthy of trust.

But our energetic farmer's wife was not to be thwarted in her plans for improvement, by locks and keys, yet how it was she contrived to accomplish so much in the way of polishing and refurbishing, with her limited means, must remain a mystery to every body else, as it ever was with me—I could never solve it. I only know what was done, for I was a child, and looked on in amazement to see a house which was scarcely comfortable, assume so pleasant an appearance, and a table from which the pigs might have gone away in disgust, made attractive, with scarcely any additional expense. She had a place for every thing and every thing in its place; a time for every thing and every thing in its time.

It is not pleasant, neither is it an easy matter to enter into details, especially the details of housewifery; but it is true that there is a great necessity for instruction in this branch of woman's education. Each house-keeper is too willing to think that her way is best; and there is a prejudice, too, against *book-house-keeping* as strong as against *book-farming*. If it is suggested that domestic economy may be taught young ladies in school, and that many valuable ideas and hints may be obtained from books and teachers, it is answered that girls had better learn these things at home—that their mothers can furnish this portion of their education, where it will cost no money to obtain it. It would be dangerous informing them in many instances, that this is just what their mothers are not capable of doing, having never learned themselves; and it might be as impossible to convince them that there is no danger in learning a hundred ways of doing a thing, for we may then judge which is best. I once heard a house-keeper say, that from the most ignorant Irish servant she ever employed, she learned something valuable.

A woman who has a knowledge of chemistry, and obtained it with reference to applying her knowledge, can make better cheese, butter, and soap, than one who is ignorant of the chemical nature of acids and alkalies. I have seen soap boiling in the cauldron day after day, and a poor woman, weary and worn, trying experiments with ley, and water, and ashes, till she was in despair; and sometimes throwing it away, or consigning it to barrels for the family supply during the year, as unfit for use as the ley itself, when a knowledge of the simple rules of proportion in mixing her materials, would

have saved her the labor and anxiety of a week.

It is the same with many other things; much time and toil are expended in making experiments and remedying evils, which a little book-knowledge, practically applied, might have entirely prevented. I remember to have often heard her, who, called upon to re-model, renew, and replenish in the old farm-house, say that there was nothing so corroding as dust; and no one would doubt this was her firm belief who saw her wield the duster! After she had once fairly cleansed and put in order her rooms and furniture, there was never again a particle of this corrosive substance to be seen upon any article in her house; for hers was the old Scotch maxim, that "any gude wife may clean, but she is the neat one who keeps clean."

She also asserted that the dishes might be ever so handsome with which a table was *laid*, but if they were not arranged handsomely and orderly, the table could not look well, and the food did not relish as well either; and she insisted that, though those who dined were coarse, hard-working men, it was no reason why there should be no pains taken with the preparations for the meal. The dishes were arranged with the same care every morning, noon, and night, as if the Governor were expected; and it did not take any more time to place them orderly than disorderly. One might at any time have eaten each meal in the dark with little difficulty, for every plate, knife, and fork, and every variety of meat and vegetable had its appointed place, from which it never departed. It was also required that those who sat at table should eat and drink with the same propriety as those who are not hurried by toil. Those who came from the field and work-shop, were allowed time to make themselves neat; and while at table they were waited upon as politely as so many guests from city drawing-rooms would have been. This would have been called a waste of time by many, for they could have helped themselves, and eaten after a clownish fashion in half the time, and thus been sooner at their work again; but our farmer's wife thought, as I do, that it is not all of life to work and hoard money.

They lived in a secluded country place, with little society; and if they did not cultivate habits of order and politeness among themselves, in their daily intercourse, they would be clowns indeed. Her children were daily and hourly associating with the workmen and workwomen of the farm, and they were taught, and practised, every species of work themselves; they must therefore be especially careful to cultivate dignity and self-respect, and require it from those around them, that the false sentiment concerning the deteriorating and humiliating influence of labor might not take root in their minds.

There were many in the neighborhood to ridicule this new standard; to taunt the children with *feeling grand*, because they attempted to be courteous. She, however, who guided them, was not governed by caprice but by principle; and she steadily persevered in her system of training, till there were many who fully appreciated her course and followed her example; and far and near, the change in many a household might be traced to the quiet leaven which she kept ever at work; and which, if it did not

leaven the whole lump, infused so much of its elevating influence, as to raise the rural neighborhood in which she lived, far above what it was, and far above any around it.

For the American Agriculturist.

SQUASHES.

GOOD VARIETIES FOR CULTIVATION—NOTES OF EXPERIENCE—KEEPING OFF INSECTS, &c.

IN your paper of April 27, 1853, was an article on SQUASHES, by the Rev. W. CLIFT, which I read with much pleasure; and, as at its close, the writer very generously offered to give a sample of the seed of the Acorn variety to any who might wish them, I took the liberty to write for some, and in return received a very polite letter, enclosing a few seeds of four varieties, the Stonington-Marrow, Cop, Custard, and Acorn; for which, as I have not yet had an opportunity to thank him in person, he will please now accept my thanks. At your request, I will now give you a brief history of my success with the seeds.

At the time they came, I had no ground which I could properly prepare for them, excepting in my garden. I planted them on the side next the turf, and as far apart as I could, though aware that I ran the risk of their mixing. The Marrow, Cop, and Custard, were quite near the grass, into which I choose to have a part of the vines run, that they might not overspread the garden. The seed of the Stonington Marrow sent out 3 or 4 vines, which bore two specimens only of its kind; they attained a good size, however, being 10 and 12 inches in their shortest diameter; color, greyish green. I am not certain that they fully ripened.

The Custard vines grew 4 very fine specimens, quite uniform in shape and color, varying a little in size. The outside of the fruit of a cream color, the inside a light orange; very sweet, fine grained, excellent for pies.

The Cop seed threw out more and ranker vines, and was more prolific than either of the preceding, but less uniform in size, shape, and ripening. Some of them were nipped, others the reverse. Some were long, some nearly spherical, and others as flat as the old yellow field pumpkin. The flesh was very rich, of a deep orange color, but not so fine grained as the Custard.

The Acorn is deserving of more notice. I put the seeds in a row of three or four hills on the opposite side of the garden. Near them on one side, were two rows of pole beans; on the other, some 12 feet distant, was an arbor ten feet high, intended for grapes; the slats about one foot apart. The vines conducted themselves in a way I was not prepared for. Some of them started for the bean poles, raising their ends when within two or three feet, at an angle of 45 degrees, to clasp the poles, (now covered with bean vines,) around which they clung, and hung their fruit. The fruit from these vines did not ripen well, but those branching out from the other side of the hills, steered directly for the arbor, climbed to its top, in defiance of grape vines, and blossomed, *letting their fruit down between the slats*. These ripened better than the others. It was almost wonderful to see how these vines; instead of creeping, had climbed to an elevation never intended for such heavy fruit, and that, too, right in the face of the moral of what has been considered a fable hitherto, namely; the story of the philosopher who thought it would be a better arrangement if the oak and the pumpkin vine would exchange fruits. As they grew till their weight might be reckoned by pounds instead of ounces, it seemed as if the vines must break, but they did not, and the squashes hung safely till gathered.

I consider this the most valuable of the four kinds, though none of them will keep as well as the common Crook-neck Winter Squash. I have raised these for years, and by selecting seeds from the longest keepers, I have been able to keep them more than a year, and twice I have

exhibited specimens of the previous year's growth, which were neither wilted nor shrunken, at our annual agricultural fairs in October.

In your paper of March 8, on the first page, there are three figures of the Acorn Squash. The fruit from the seed sent me by Mr. CLIFT, was quite uniform in shape, and size also, as far as it ripened, and most nearly the 3d figure; every squash having the peculiar resemblance to the black oak acorn while in its cup, which I presume gives it its name. From my experience of this last season, I should value them as follows: 1st. The Acorn for richness and sweetness. 2d. The Cop for richness, or body, and fruitfulness, but it is more fibrous, and not quite so sweet, as the Acorn. 3d. The Custard, very fine grained and very sweet, but lacks body, and is almost entirely without fibre.

I should not cultivate the Stonington Marrow if I could get the others. In this estimate, I speak of them only as suited for pies. Those who like boiled or baked squash, may rate them differently. I shall try the first three named kinds this season under more favorable circumstances, though I expect hybrids in return.

One thing more—I am satisfied from experiments already made, that any cultivator who will take the trouble to select seeds from the best specimens, which ripen well, and keep longest, will eventually raise such fruit as will keep the whole year. The same principle will hold good with most vegetables. Nothing will repay the trouble more surely, than care in selecting and improving seed.

As it may be of use to some, I will tell you how I preserved my young vines from insects. I have sprinkled the plants when infested with the little striped bug, with a solution of tobacco, have dusted them with snuff and wood-ashes, all of which undoubtedly did some good; but the only entirely efficacious thing I tried, was a plentiful supply of the simple super-phosphate of lime. I put a little guano to some hills, but it killed wherever it touched the plant. I intend trying the super-phosphate this season on any vegetables I may raise which suffer from insects. Another year I may have more to say. If I had not made this communication so long, I should like to say how highly I approve of your paper under its present management; but it needs not my commendation. Success to it.

Yours truly,

D. B.

Middletown, Ct., April 4.

For the American Agriculturist.

THE BLACK SPANISH FOWL.

A "FANCIER" asks your readers if we have the Spanish fowl among us? and further asks for the points of the true fowl.

I have recently imported several varieties of domestic poultry, one of which is the "pure Black Spanish," selected from the henary of THOMAS H. FOX, Esq., of London, also an importation direct from the Minorca Isles of Spain. Mr. Fox's Spanish birds are one of the most celebrated stocks in England, having taken seventeen prizes during the last year. Her Majesty, the Queen, is a celebrated fancier, and would make no mean selection. The birds which she purchased of Mr. Fox are the same blood and brood to mine.

The color of this fowl is of a glossy black, and the feathers of the legs, thighs, and belly, are particularly decided in their hue, and of a velvety aspect. It has a white cheek, which extends to the comb above the eye. The wattles and comb are extraordinarily large, single, and of a very high color. The feet and legs are of a leaden color, except the soles of the feet, which are of a dirty fleshy hue.

The Black Spanish in England, that lacks any of these qualities; can be bought for a half crown, especially if the whole cheek be not white, in a full grown bird. But the pure birds, with all of the above characteristics, sell as high as from \$50 to \$100 each. The father of mine was sold for \$210 by Mr. Fox.

The hens are layers of the first order, and

give the largest and best flavored eggs. And as table birds, they hold a place in the very first rank.

S. W. JEWETT.

Middlebury, Vt., April 8, 1854.

For the American Agriculturist.

"BLINDS" ON HORSES.

IN passing through this city, I have seen many fine horses, some of which must be getting blind from the cruelty of their drivers; not by whipping or starving, but from the manner in which blinders, so termed, are used. No horse can have good eye-sight after wearing these unnecessary appendages for a length of time, as I have seen them, so closely drawn together in front as to rub or chafe the eye-lids. It is hurtful to have them, worn as they usually are, thrown out an inch or so from the eye. If they must be worn, it would be much better to set them out, at an angle of forty-five degrees or more, from a right line with the side of the face. It would, however, be still better if they were not worn at all.

A horse will soon get so accustomed to all he can see, as not to be any more easily frightened without them than he is with them, by the sense of hearing. He is too valuable an animal for us to be careless of his health and comfort, too noble a gift to be so misused as to lessen his own innate worth, to say nothing of his commercial value.

I have charged this as a cruelty coming from the drivers, because they can easily remedy the matter. It is not my intention to assert, that the wrong in this matter is so by the choice of these men. It would be as much as saying that they, as a class, are destitute of all the kindly feelings of humanity.

These remarks are not intended to apply to the city more than to the country, for these cruelties are practised in the latter place quite as much as in the former.

A COUNTRY FARMER.

For the American Agriculturist.

INQUIRIES ABOUT MAKING SUPER-PHOSPHATE.

I AM a young farmer, living in the Great Valley of Virginia, about 70 miles south of Winchester, and 25 miles north of Staunton. Our lands lie upon great beds of limestone, with belts of slate running through it. Clay is the prevailing basis of our soils. The lands are naturally productive, and best adapted to grass and wheat; and they have not been worn down as much as the greater portion of those of East Virginia. Still there is great room for improvement, both in the quality of our lands, and in the prevailing system of farming.

I am satisfied that our soil is deficient in the phosphates, as you might infer from the single fact that they have been constantly grazed for a century, without any adequate return being made for the material which entered into the frames of the cattle. We must have bone manure; but *whether it will be best for us to bring it from the north, or manufacture it at home*, is the question I would be glad to have solved by you and your correspondents. There is now a railroad (the Central) completed to Staunton from Richmond, with a branch from Alexandria, and in two or three years we will have one (the Manassas Gap) to this place from Alexandria.

In the first place, then, it must be ascertained what bone dust would cost us here, if purchased say, in New-York or Philadelphia. In the next place, can we manufacture it at home so as to enable us to get a sufficient quantity at a lower price than we could import it for? We have flour mills and water-power in abundance, but I wish to ascertain (1) the cost of the necessary machinery for crushing the bones, (2) the probability of a retired, farming community like ours, without large towns, being able to furnish a sufficiency of bones to justify the

erection of a mill, and (3) the probable cost of buying, collecting, and grinding the bones?

Of course, I would not ask the use of your columns for this purpose, were my object merely a private one, and were not the information sought calculated to interest and benefit the country at large. I would respectfully ask the views of any persons who have examined this subject.

W. H. RUFFNER.

Harrisburg, Rockingham Co., Va., April 4,

We will leave the discussion of the above topics with our correspondents for the present. In No. 8 of last volume, (page 113,) we gave the process of making Home-made Super-phosphate, and on page 56 of the present volume, we gave a few statements in regard to its manufacture, which Mr. R. had not seen at the time of writing the above letter.

AN EXCELLENT PLAN FOR GROWING CUCUMBERS.

WE clip the following from an exchange. We have tried the same plan and proved its excellence:

Take a large barrel, or hogshhead; saw it in two in the middle, and bury each half in the ground even with the top. Then take a small keg and bore a small hole in the bottom; place the keg in the center of the barrel, the top even with the ground, and fill in the barrel around the keg with rich earth, suitable for the growth of cucumbers. Plant your seed midway between the edges of the barrel and the keg, and make a kind of arbor a foot or two high for the vines to run on. When the ground becomes dry, pour water in the keg in the evening—it will pass out at the bottom of the keg into the barrel and rise up to the roots of the vines, and keep them moist and green. Cucumbers cultivated this way will grow to a great size, as they are made independent both of drought and wet weather. In wet weather the barrel can be covered, and in dry the ground can be kept moist by pouring water in the keg.

CHINCHA (GUANO) ISLANDS.

THE *Boston Traveler* has been favored with a perusal of a private letter from these islands, dated the 19th of Feb., which contains some items of interest that will repay every reader for the perusal. The following are extracts:

There were at the Islands, at the date of the letter, one hundred and sixty vessels of various sizes, from 300 to 2,200 tons' burden—averaging probably 800 tons. The estimated average time for loading with guano was forty days.

The rate of exportation of guano from the Islands is said to be 1,000 tons a day, which it was thought would not exhaust the heap in ten years. A geological survey, made by order of the United States Government, had estimated that eight years would exhaust the supply.

"There are three of the Chincha Islands, lying in a line, N. and S., the passages between them being less than a half mile. The wind is always S. and E. and it is never known to rain. The north island is the largest. It is nearly circular, and about one-third of a mile in diameter, and about 100 feet high. Some parts of the coast are steep high cliffs, and others sandy and rocky coves of gradual ascent from the shore. The heap of guano continues to deepen to the highest point of the island, where it is 100 feet in depth. Fancy a large old-fashioned loaf of brown bread, laid upon a table but little larger than the base of a loaf, and you can pretty nearly see the pile of guano on either island. The laborers commence digging and proceed along the top of the rock in the direction of the center, from all parts of the island; and therefore in their progress, have shown the guano in a very steep side from the base rock, 80 feet

high; and from every part it appears to be the same substance—hard and close.

Every spoonful is dug with a pick, and when loosened is as dry as powder, and of course dusty. If left in a pile but a brief period, it again becomes hard, and must again be loosened with a pick. From the base to the top are found feathers, eggs, and stones of all sizes, some weighing even two or three tons. I have taken out many perfect feathers, far from the top; and near and upon the surface have seen what appeared to be bone and flesh decomposed.

It is thought the pile now called guano, is the decomposition of sea animals, of which there are multitudes now, and they are presumed to have been far more numerous in ancient days, before the white man came to destroy. Sea lions of a large size, (a ton weight,) seals and endless quantities of sea fowls have been the inhabitants of these islands for myriads of years, and the islands have been the burial places of these animals; for if wounded they crawl up to the top. So say the knowing ones. Birds and bird-lime go to increase the pile. Guano is really decomposed animal matter, but whether this was the way so vast a pile accumulated, or whether the islands were thrown up from the bottom of the sea with the deposit upon them, you must judge for yourself.

The second island is similar in size and pile to the one described. The third one has not been touched yet. It is much smaller, but well loaded. Guano secretes large quantities of ammonia, and, confined as it is in a ship's hold, a man cannot stay more than five or ten minutes at a time among it. Besides large lumps of pure ammonia, are daily found apparently decomposed bones, eggs, &c., and among other items a man in a perfect state of preservation—the real ammonia, strong as volatile salts.

Now do you wish to know how all those ships are loaded, and a thousand tons per day dug and sent from the islands? Well, there are about 100 convicts from Peru, and about 300 Chinamen from the Celestial Empire. The former are in the right place; the latter were passengers that engaged passage in an English ship for California, and engaged before they left their own country to labor after their arrival for a limited time to pay their passage (\$80.). Instead of being landed at California the ship brought them direct to this place, and the captain sold them for three and six years, according to the men, to work out their passage; and here they are slaves for life. They are allowed \$4 per month for their food, and one-eighth of a dollar per day for their labor, with a pile of guano before them which will last the next ten years; and long before it is exhausted the majority of them will be dead. Each man is compelled to bring to the shoot five tons of guano per day. A failure thereof is rewarded with the lash from a strong negro, and such is their horror of the lash and the hopelessness of their condition, that every week there are more or less suicides. In the month of November, I have heard, fifty of the boldest of them joined hands and jumped from the precipice into the sea. In December, there were twenty-three suicides. This is from one in authority. In January, quite a number, but I have not learned how many. I was a few days since on the South Island, and there saw two of the most miserable, starved creatures; they had swam across on their wheel-barrow, and fully determined to die. I could not feed them, and my heart ached for them; so after we reached the ship, a boat was dispatched with bread and water for their relief. Perhaps this availed nothing, for they must either return to their task, or some one must feed them daily. The Chinese, it is said, are educated to believe in the transmigration of souls, and therefore think if they leave this life they shall return to their own country. It is thought this faith induces them to leave their wheel-barrow and commit suicide.

Thus by diminishing the number of laborers, the exports are reduced, and to meet the demand of so many ships, two English ships, (one

of which has been here before,) are soon expected with other loads of passengers from the Chinese dominions, deceived, most probably, with the idea of going to California to dig gold. In fact, it is said, the first batch of celestials had dug many days before they were undeceived.

The process of loading the ship is either by placing the ship close to a steep, rocky cliff, and have the guano run through a large canvas hose from the top of the hill into the ship's hold. 500 tons per day are put on board by this method; and as there is seldom much wind or swell a ship can lie very well. Boats that go under smaller shoots, are sometimes loaded and return to the ship, where it is taken on board in tubs made from barrels.

ON THE CULTIVATION OF ONE GRAIN CROP AFTER ANOTHER ON HEAVY LAND.

If I was asked to define "What constitutes the most profitable course of agriculture." I should say it consists in pursuing that system which is most suitable to the soil and climate, and at the same time making use to the fullest possible extent of every natural and local advantage peculiar to the district. It will be found, I think, that whenever the profits made in farming have been higher than usual, the great source of success may be traced to the above causes. In the published statements of successful farming, which have appeared from time to time, will be found much to confirm my views. While, however, we assign to the authors full merit for their skill and enterprise, it is necessary to employ extreme caution either in recommending or adopting their system. The local advantage which constitutes the main element of their success may be wanting in another district, and it must be borne in mind that the deficiency of one link in the chain may be sufficient to invalidate the whole of the conclusions. One of the most difficult problems of the present day is to decide how far we may deviate from the beaten track, and how far the various novelties may be profitably adopted. The enterprising farmer feels a growing conviction that much is still to be learnt, he feels that if, with his present knowledge, he could obtain the prices which his father had fifty years ago, he would make great profits; and if he now possessed the knowledge which his son will possess fifty years hence, he would doubtless make still larger profits. The adoption of the four course rotation on the light soil may be taken as a happy adaptation of a peculiar process to a suitable soil, and we consequently find a progressive increase in the value of these soils, while on other soils the value has been either stationary or declining. The root crop, which may be considered the basis of the four course rotation, although extensively cultivated on heavy soils, is generally admitted to be less essential to profitable farming than when grown on light soils, and in my opinion the benefit derived from it is very much lessened whenever the soil is injured by the treading of stock in the winter.

The large supplies of artificial manures containing ammonia which have been in the market for some years, offer advantages to the cultivators of heavy land which they have not, perhaps, fully understood, and they have employed them in increasing the growth of root crops rather than in the direct growth of corn.

The growth of one grain crop after another has been pronounced by many to be a bad system of farming; there is, however, no scientific ground for this opinion. Loss of ammonia is the principle cause of the exhaustion of land from the growth of corn, and this may be replaced by a direct supply of ammonia in the form of an artificial manure, as easily as by the growth of a crop which does not exhaust it. On heavy land a crop of barley after wheat, manured with three cwt. of guano, or two cwt. of guano and one cwt. of nitrate of soda, will often yield a more valuable produce than the same crop taken after turnips. The selection of the crop to follow the previous crop of corn should

depend upon the tilth more than on any other circumstance. Peruvian guano, or a mixture of that with nitrate of soda, are the best substances to use, they should be sown at the same time as the seed, and it is advisable to sow as early as possible in the spring. It is essential that the land should be tolerably clean, otherwise the manure is expended on the growth of weeds instead of corn. We have in the present prices of corn an example of the powerful influence of climate apart from legislation, and although the effects of a good harvest must be to reduce prices, we can hardly expect very low prices until after a second abundant harvest. In the meantime advantages should be taken of the times. If a farmer cannot follow the plan adopted by a manufacturer, who at one time works his factory at full power or half power, or at another time closes it altogether, he may to a certain extent imitate it by increasing both his average produce and acreage extent of corn when prices are high, and reducing them when prices are low. It may be said that many tenant farmers would be willing to grow more corn were they not restricted by leases or covenants. That certain restrictions are necessary to protect the landlord there can be no doubt, and it is for them to consider whether an agreement could not be made which, while giving full liberty to the tenant as to his course of cropping, at the same time protects the soil and the incoming tenant from injury. That, with the advancing knowledge of the day and the increasing sources of manure, an inflexible rotation is injurious, there can be but little doubt, and as any reduction in the profits of the farmer must, sooner or later, injuriously affect the landowner, it would be well for them to take into consideration the hint which I have just thrown out.—*J. B. Lanes, in Rendle's Price Current and Farm Directory.*

GREAT DISCOVERIES.

As a specimen of what we often receive, we publish the following letter, without "note or comment," for the information of all concerned. Will the poultry committee please attend? We cannot, however, promise to publish any others.

YOUNGSTOWN, Ohio, April 8, 1854.

To the Editors of the Am. Agriculturist:

Knowing that you are publishing a leading agricultural paper, I have concluded to address you on some very important matters relative to that branch of business, especially on fruit growing, &c., as I am in possession of certain knowledge relative to the protection of fruit trees against the borer and other depredators, which would be of vital importance to the farmer and the horticulturist. My remedy is a radical, and also philosophical one, and is very easy of access, being in the reach of every farmer or horticulturist, it matters not how small his pecuniary abilities may be. And the application is so plain and easy, that a boy twelve or fifteen years of age may be able to tend an orchard of fifty trees in a few hours. I have been in possession of this knowledge for the past ten years, but thought best to retain it and test its merits more thoroughly.

I find from reading newspapers and agricultural journals, that many orchards are almost destroyed, especially in the bounds of the State of New-York, therefore I thought the most desirable point for such knowledge to be imparted and gained, would be where the most public complaints arise, viz., within the State of New-York. Therefore, I will lay this matter before you for consideration and investigation. I would wish also to inform you that my pecuniary abilities are such that I cannot afford to give my invention or discovery to such a rich government as this for its sole use and benefit, without some small remuneration for it. The price which I have placed upon it, I consider a small amount for the labor and time which I have spent in acquiring this means of a philosophical and radi-

cal cure. I have concluded to dispose of this knowledge for the benefit of this Great Republic upon receiving the small amount of five thousand dollars. If I were in France I would get fifty thousand, and it would be considered very cheap at that. I am certain of a preventive in the protection of young orchards from frost during winter, which I will give you and your readers gratis for investigation and thorough trials. I am satisfied as to the beneficial results of my experience in the matter. It is this:

Plant seedling stalks, and not trim or prune off any of the shoots from the ground up, saving a few which may be taking considerable lead, graft on the top of the stock at from five to seven years old, leaving the sprouts as usual on the trunk or body of the tree. The consequence will be a hardy, tapering stock from the ground up, which will resist all frost. Shape the top up to fifteen years' growth from this, and it will bear more fruit. Use no alkaline washes. From fifteen to one hundred years is the time to stimulate the tree.

I am also in possession of certain knowledge in sheep culture, which is of most vital importance to the farmers of these United States, in the protection of sheep from disease arising from different causes, but this scientific discovery I am not disposed to impart as yet, until I test its merits more thoroughly. It will be of the utmost benefit to these United States, when I am inclined to make it publicly known, both in a commercial point of view and national wealth.

You will probably wish to know something relative to some other branches, connected with the apary business, or keeping or tending all kinds of birds, judging of their qualities and qualifications, and also poultry. In every thing and every department connected therewith, I am perfect, in treatment and management. I am also perfect in management of the different kinds of fruit, and packing for market. You will, therefore, please recommend me to some one connected with the poultry club—P. T. BARNUM, or some other members of said club. My address is Youngstown post-office, Mahoning County, Ohio. You will please inform the members of the poultry club of my address. If they should wish to employ a person perfect in every thing connected therewith, they will please send to my address at the earliest convenience, and oblige your humble servant,

THOMAS WILSON.

For the American Agriculturist.

THE CANADA THISTLE.

KILLING THEM WITH BUCKWHEAT.

THERE are various opinions among practical men as to the best method of exterminating this pest to the farmer. It is clearly understood by all, that to have a plant flourish, it is necessary it should have a good healthy top. The roots cannot live without a top, more than the top without roots; consequently, if we destroy one we bring certain death to the other, sooner or later. But a tough hardy plant, like the Canada thistle, daisy, elder, &c., requires close attention, and the tops must be constantly cut or bruised off. You may do this as you like, but the point is, do not let the tops grow at all. I will relate my course of destroying these intruders.

The elders are cut with a brush scythe, and where thistles and daisies are plenty, I overpower them with the plow. Where they are scarce, I do it with a hoe. When I wish to run them out, I begin early in the spring, and plow the ground, then let it lie until the first of June, and plow again. On or near the Fourth of July, I sow buckwheat and harrow in. After the buckwheat comes off, I plow again and leave it for the winter. I repeat this process every year and raise good crops of buckwheat. I make it an invariable rule to set in with my plow as soon as the plants begin to grow.

Buckwheat exhausts the land but little, and I raise several crops in succession.

A. L. SMITH.

Nichols, Tioga Co., N. Y.

CLAIMS OF AGRICULTURAL PATENTS.

FOR THE WEEK ENDING MARCH 9, 1854.

PREPARATION OF VEGETABLE FIBERS.—David A. Wells, of Cambridge, Mass.: I do not claim broadly subjecting vegetable substances to the action of acids, as this has been done before for other purposes, and under essentially different proportions and circumstances, and with a different view, and therefore I do not wish to be understood as claiming broadly subjecting vegetable substances to the action of acids, except when used for the purpose of removing bases which would entirely, or for too long a time, resist the chemical action of the other branches of the process employed to obtain cellulose.

I am also aware that lignine has been separated from woody fiber by dissolving the cementing substances in alkalies more or less caustic, and then subjecting them to subsequent mechanical operations for obtaining fibers, I do not therefore claim simply subjecting vegetable substances to the action of caustic alkalies.

I am also aware that vegetable substances, after being subjected to the action of caustic alkalies have been treated with acids but under different circumstances and for a different object. Heretofore this has been done for the purpose of removing any adhering alkali, and all other foreign matters, whilst in my process I use an acid of an entirely different strength, not for the purpose of removing any alkali remaining from the previous branch of the process, for this I previously wash out, and not for the purpose of removing any gummy or glutinous matter, for this I previously remove by means of the caustic alkali.

But I have found that the cellulose treated with an acid of such a strength and for such a length of time is so altered, that the subsequent bleaching by the ordinary means is greatly facilitated and cheapened, and therefore I do not claim broadly treating vegetable substances with acids after they have been subjected to the action of caustic alkalies irrespective of the circumstances and the purposes specified.

First, aware that acids have been used in the treatment of crude or unprepared vegetable fibers chiefly for the purpose of breaking up and mechanically separating the woody and gummy matters, I do not therefore claim any such process.

But what I regard as my invention, is removing coloring and resinous matters, from the cleaned and dressed flax, hemp, and other equivalent textile and fibrous material, designed to be spun, felted, &c., by means of weak acid of about 3 deg. Beaume, as set forth.

In combination with the above I also claim the employment of caustic alkalies, as specified, to obtain cellulose from vegetable substances for the manufacture of paper and for other purposes in combination with the use of alkaline earths, as specified, to preserve or restore the caustic state of the alkalies, as set forth.

And finally, I claim in combination with the process for the separation of cellulose from vegetable substances, subjecting the products thereof to the action of a solution of efflorescent salts, as specified.

[Every improvement in the preparation of flax is of great importance to our country. We know that many plans and processes for effecting the easy and complete separation of the woody from the fibrous parts of flax, have been employed, and yet difficulties surround every one of them. Dr. Wells, the discoverer of these new improvements, is a good chemist, and has deeply investigated this subject. The results set forth in his patent were only obtained after laborious researches and many experiments. We are confident that he has added something new and important to the chemistry of flax treatment, and we hope his invention will be the means of removing every difficulty which now lies in the path of preparing flax for spinning and weaving.]

CRANBERRY WINNERS.—Phanuel Flanders, of Lowell, Mass.: I claim the cleaner and the

arms or their equivalents in substance, and the separator when the same is made and operated as set forth.—*Scientific American*.

Horticultural Department.

TO HORTICULTURISTS.—Our weekly issue of so large a journal, gives us ample room to devote to the different departments of cultivation, and we have commenced with this volume, to allot a separate space to Horticulture. We have secured additional efficient aid in its conduction, and we invite horticulturists generally, to send in their contributions on all subjects interesting and instructive to those engaged in similar pursuits with themselves. We are receiving the leading foreign and domestic horticultural journals, and shall be abundantly able to bring promptly before our readers all that transpires, which may be new and useful.

NEW-YORK HORTICULTURAL SOCIETY.

MAY EXHIBITION.

THIS Society is making spirited preparations for their Spring Exhibition, to be held at the American Museum, from the 1st of May to the 6th inclusive.

The premium lists, amounting to more than \$300, are out, and embrace with great liberality, almost every article desirable for exhibition. They will extensively attract the attention of both professional and amateur florists, who, we trust, will be induced to bring forward their choicest plants.

We judge from present appearances that the influences combined in this exhibition, and especially the activity displayed by the members of the Society, will make it a highly creditable one, even for the metropolitan city.

STRAWBERRIES—MR. HOVEY vs. McAVOY'S SUPERIOR.

IN the April number of *Hovey's Magazine*, in a notice of the new prize Seedling Strawberry from Ohio—McAvoy's Superior—it is said, "Mr. PARDEE, of New-York, after reading our description, stated that we could not have the true kind, as numerous spurious sorts had been sent out for it, and ours was probably one of the errors." And again a little farther on in the article, he says, in speaking directly of McAvoy's Superior, "but recollecting that, according to Mr. PARDEE, *nineteen-twentieths* of all sent out were errors, &c." In answer, I beg leave to state in regard to the last assertion, he is mistaken. I have never said or written *any such thing* in regard to *this* strawberry. I made a similar statement in regard to another strawberry, and I gave Mr. HOVEY a part of my authority in an extract from a letter I received from Mr. McAvoy himself, fully justifying the position I took. Mr. HOVEY, in reply, wrote me a courteous answer, but never did me the justice to publish a notice of it, or in any way correct his previous article.

Neither did I make the positive assertion as Mr. HOVEY states, "that he could not have the true kind." Mr. HOVEY should be more accurate. I was endeavoring to help Mr. HOVEY out of what appeared to be a very unpleasant dilemma he had fallen into, and put the most charitable construction on his course I could,

by saying, "It seems to me we are driven to the conclusion that Mr. HOVEY has obtained only the spurious kinds, &c." Instead of a positive assertion, I simply stated it so appeared to me, rather than to have it inferred that Mr. HOVEY wrote under the influence of prejudice or error.

In order that all I did say may be fairly understood, I will here insert the article entire, from the *Country Gentleman*, to whose editors I addressed it, saying:

You have obliged your readers by giving in one article, the comments of our strawberry friends in Cincinnati, Philadelphia, and Boston, on the New Ohio Strawberries. That all reasonable allowance is to be made for difference and change in soil and climate cannot be denied; but this, I opine, can in no wise account for the radical difference between the men learned in strawberry lore, in Cincinnati and Philadelphia, and Mr. HOVEY of Boston.

It seems to me, we are driven to the conclusion that Mr. HOVEY has obtained only spurious kinds, inasmuch as it is well known some of the most respectable nurserymen of Cincinnati have sent out only the spurious kinds, much to the chagrin of their friends at the East. One house at the East, obtained only one genuine plant in a dozen; another, five; but a much greater number received none but spurious ones. Even a worthless pistillate has been freely sent out by respectable nurserymen at Cincinnati, (unwittingly, I hope, but not excusably,) for the celebrated staminate Longworth's Prolific, to the great disappointment of many.

Under these circumstances, it seems to me only fair to conclude, that Mr. HOVEY, in common with others, has been imposed upon, otherwise he could not describe McAvoy's Superior, even in Boston, as "only of fair size, dark dingy color, like the Hautbois, &c." I have seen McAvoy's Superior 200 to 350 miles east of my residence, and in a dozen places in Western New-York, and in every place the genuine has induced the expectation that it will prove an acquisition, while in several places I saw strawberries on plants direct from Cincinnati, for that variety, of worthless kinds, and one, particularly, had the Hautbois appearance described by Mr. HOVEY. I will engage that the McAvoy's Superior, which I have in my garden, and which well agrees with the Cincinnati and Philadelphia descriptions, cannot in any fair manner be made in Boston to bear fruit in any wise corresponding with Mr. HOVEY's account.

The same may be truly said of Longworth's Prolific, only grosser errors have been committed with this variety. I am assured from the highest authority in Cincinnati and elsewhere, that the greater proportion—I should think at least nineteen-twentieths—sent out for this kind are spurious, and I myself was victimized with this variety, but speedily corrected my error, and on examining the genuine wherever bearing this year, it seems to afford full assurance of its high character.

These discrepancies and disappointments call loudly upon nurserymen not only, but us who are amateurs, to investigate thoroughly, and be sure we have only the genuine kinds, and then give them a wide berth, and keep every kind distinct by itself, and on no account when we are busy in the fall, allow them to intermix.

I think I have received conclusive proof this season, that staminate plants, 30 or 50 feet, or even a greater distance from the pistillates, are just as useful to fructify them, as when in the same bed. Staminate in a row around the border of an ordinary garden, is all that is necessary.

R. G. P.
Geneva, July 28, 1853.

I have a letter from Mr. McAvoy, and my friends in other places have letters from other nurserymen in Cincinnati, which I have read, that fully justify the "nineteen-twentieths" which Mr. HOVEY quotes so repeatedly in his several articles.

In regard to the color of McAvoy's Superior, I saw it on the tables of a number of horticultural exhibitions last June, in company with 50 to 60 of the most improved varieties, and its bright color compared favorably with the other varieties on exhibition. Perhaps, however, Mr. HOVEY wishes its color brought critically to his standard Hovey's Seedling, which we all know is a remarkably bright berry.

WINTER GARDENING—No. 1.

[THE following article was written several weeks since, but was quite accidentally overlooked till now.—Ed.]

Ever since I had a garden, I have noticed in the early spring, that some plants looked fresh and green—and these were cabbages, onions, parsneps, spinach, &c. Now, I said, if these vegetables will stand the winter as accidents without cultivation, why not plant them in the autumn with good manure?

As the spring advanced, I saw some leaves of potatoes peeping above the ground, and then there were scattering peas, tomatoes, and here and there some other vegetables, as for example, the asparagus from the seed. The experiment would not cost much, and so I determined to make one, thinking it might do some good. If it failed, it would be my loss, and of course I would not communicate the failure; although I think that a failure is sometimes more important than success. I knew a physician who published all his unfortunate cases, and he lost his practice; the quacks publish all their cures—hence their success. There is the same difficulty in gardening and farming as there is in the treatment of the human body in health and disease, and I may say in all parts of creation. Every part of creation is in a state of disintegration; and it is the design of the scientist to arrest this process as far as he can. It is a very remarkable fact that every thing has a life. You will hear an engineer speak of the life of a cannon, and every conductor on a railroad knows that the axle also has a life—it has its average term of years.

Now this law extends to animal, vegetable, and mineral life. Take, for example, a potato; it flowers and produces seed; perhaps not one of the seeds will produce a potato like its parent one. These potatoes may preserve themselves under cold and heat, may be waxy or mealy, may be sweet or bitter. How are we to account for this? We know the fact, but we do not know the mode. We must be content with results. If you take a potato and plant it in winter, it will not rot so fast as one planted in the spring; or if you manure it with fish, it will not rot as soon as either. We cannot reason upon these subjects. We must watch and look for changes, and these are what are called improvements. Now an improvement is a mere necessity. If you could plow as well with a wooden plow, as they did in years past, who would use an iron one? A man would be thought a fool who would recommend planting in winter what he could do in spring; and yet when he is told that cabbages planted in November, will produce heads for one year, he thinks it an absurdity. But this is the law of progress, and we must follow in its track. The necessities of mankind produce inventions, and when we reflect that machinery takes the place of human hands, it is only another work of necessity. The stimulus of necessity is the great impelling power to improvement. Take for example: if you can raise a new potato by the first of April by ordinary means, you would anticipate a southern crop, and consequently save very much; that is, you would gain all the difference between potatoes raised in April and July. Many farmers do not plant their potatoes

until the 1st of April, and they are not often ripe before the 1st of September, and sometimes much later. Here you will perceive that there is a great loss of labor and time; you in fact lose six months of the year. If, then, a farmer knew that he could raise his potatoes fit for market in April, he would not be such a blockhead as to defer for six months what he could do in three. It comes to this at last, that to save time is to save your money—but there is a spirit of waste in our country that is most reprehensible. The Chinese are the examplers, and if we could understand their system of farming and gardening, our crops would be increased three-fold. Now it is well known that for half of the year we sit with our arms folded, and as soon as the leaves fall from the trees, we think that our work is finished, when in fact it has just begun. Here, then, is our great error, for we work but one-half of the year.

To improve time, to determine labor, make the ground yield much more than it does by the present system of agriculture and horticulture, is the object of these papers. I am perfectly aware that all innovations are received with distrust, and so it is with all systems. If any one had said fifty years ago, that a man could be conveyed thirty miles in an hour, he would have been considered a fool; and if he were told that a letter could be made understood one hundred miles in a minute, he would have been considered a madman. It has all come to pass, and we no longer wonder. Now why should not the culture of the earth correspond with the improvements which are proceeding with progress? The reason of all this is very palpable, the farmers are uneducated, and not one in a hundred knows the first principles of the constituents of soils; hence they know nothing of agriculture. The lands are worn out, and they starve by their own ignorance. All I ask is to submit facts, and if I can prove that I can raise twenty bushels of wheat where ten were grown before, I shall be satisfied. This is the object of these attempts to improve our present system.

For the American Agriculturist.

SWINE AMONG FRUIT TREES.

I HAVE often heard it remarked by old men, that "it is sure death to a fruit tree, if swine are yarded around, and allowed to root much about it, and to sleep near the body of it."

That this is not *always* the effect of swine yarded beneath fruit trees, will appear from what I have to state respecting an unproductive pear tree, and a cherry tree, in my yard. The pear tree was upwards of twenty years' old, and to my knowledge had never produced any ripe fruit. It was usually well loaded with young fruit, and much of it would swell to the size of a large hen's egg, and then would become knotty, full of cracks, wilted, and would all be cast long before it was time for any of it to ripen. Neither pruning nor manuring appeared to have any ameliorating effect. I examined scores of the fallen fruit, in order to ascertain whether or not the curculio, or some other marauder, were not the cause of such an untimely casting of the fruit; but, not a vestige of an insect could be discovered. With no expectation of ever gathering any ripe fruit from that tree, I determined to test, what I looked upon as one of the whims of our illustrious progenitors; and, accordingly, two shotes were yarded beneath the tree, in an enclosure about one rod square. They were kept here about two months. Their bed was close to the body of the tree, under a few loose boards. In this yard, holes were made with a crow-bar, and corn put in them. The whole ground was rooted over and over, to the depth of 8 to 12 inches; and many of the roots were torn up. (This was in August and September.) I was often called *wild* and *crazy*, for experimenting thus with such a valuable tree. But now for the result.

The next season, instead of seeing a *dead* tree—the result of recklessness—as was prog-

nosticated, and for five or six successive seasons, it has produced a fair crop of fine fruit; and it was never fairer nor more abundant than last fall. (And here, allow me to say, that some of the fruit was exhibited at our county fair, and pronounced to be the *most excellent* of any autumn variety, considering its size. Many of them weighed fifteen ounces each.)

The cherry tree was a few rods from the pear tree, and was literally loaded with fruit every season. But it never ripened. Some of it would rot. Some would wilt and dry up. Some would be covered with black knots, and some would become almost ripe, and then drop to the ground; no traces of insects could be found. The *hog remedy* was applied *thoroughly*, and every season since it has borne a large supply of as good cherries as ever birds picked.

From these facts, it would appear that if yarding swine about fruit trees is *generally* injurious, here is an exception. If swine were permitted to sleep close to the body of a tree, and to root about incessantly for a whole season, I am not prepared to say that the effect might not prove fatal. But, there can be but little doubt, when fruit trees have stood in grass ground for a number of successive years, and for some unknown reason, fail to produce fruit, that if swine were confined about them for a month or so, the effect would be such on the trees as to render them productive. *Perhaps*, digging about them with a spade, and manuring, would be attended with the same result. I have my eye on several trees in this neighborhood, which bore no fruit for many years; but when the plow was applied to the soil beneath them, they brought forth good crops. The facts also furnish an unanswerable argument in favor of cultivating the soil about fruit trees if nothing more.

For the American Agriculturist.

DISEASES OF FRUIT TREES.

You will excuse me, Messrs. Editors, if I begin what I have to say on the above subject, by telling you that I know of no paper in the country, that has done, and is doing, more to interest and instruct the novice in horticulture, than the *American Agriculturist*. Though I consider myself moderately well "posted up" on matters pertaining to fruit trees, their diseases, &c., yet I frequently may be found turning over its pages for a full confirmation of my experience.

Like the human family, fruit trees are subject to diseases. The best preventive of this, I consider to be free and open culture, with constant and careful nursing and attention. The want of this is what generally leaves so wide a margin for the introduction and encouragement of disease. No orchard kept in grass will flourish.

The very pleasure we derive from nursing a favorite plant, induces and awakens an *increasing interest* for its thrift and success. For myself, I must say I take almost as much pleasure in the thrifty growth of a valued fruit tree, as I do in gathering its delicious fruit.

The apple, peach, cherry, plum, and quince tree with us in New-Jersey, are often injured by a worm called the borer. My present purpose is not to present an elaborate description of the worm itself, but to refer to the effects of its attack, and the method of treating it. When a small puncture is discovered on the body of the tree at, and sometimes just beneath the surface of the ground, with sawdust like chips dropping from it, then your subject is before you. Now clear away the dirt entirely around the bole of the tree, that you may have free play, and then with a piece of middling stiff wire and a pocket knife, probe the wound until you find and destroy every worm. If the worm has taken a turn inside, and got beyond your reach, plug him in there, and seal him up airtight, with grafting wax, made much stiffer than common, by adding more beeswax and rosin. Next apply 6 to 8 quarts of a wash

made with slaked lime, ashes, fine charcoal, or almost any such substance that is offensive to the worm, and not positively injurious to the tree. If you have much injured, or perhaps nearly girdled your tree in searching for the worm, don't blame the remedy as worse than the disease, for the worm must come out. (Remember you should have done the work sooner.) Make a plaster of equal parts of clay and cow's dung, and bind it about the tree for 4 inches below, and 6 inches above the surface of the ground, and do not remove it—except to renew—until your tree is healed.

No good culturist will suffer his fruit trees to go a single season without digging around, and carefully searching for any marks of the worm. The digging would be decidedly beneficial to the tree, if no worm be found at all.

The Yellows in the peach tree is a formidable complaint, and always will be, so long as it continues to be propagated by ignorant nurserymen and transient growers. Some people are fond of dabbling in every thing. Of this class are many of those *outsiders* who, by planting every kind of peach pit they can pick up about the streets, think to raise a healthy nursery. If there is any one variety of fruit tree that is a fit subject for legislation, and that should be placed only in the hands of respectable, intelligent nurserymen, it is the peach tree. I know of no remedy for the Yellows but a complete annihilation of the whole tree, root and branch, by burning. Don't leave it a month or a day for the sake of its fruit, as such is generally premature and *insipid*.

For black knots on plum trees, and of late years on the old-fashioned red cherry tree, the only cure I know to be relied upon, is cutting off and burning up.

Curculio, and other insect ravages on plum, apple, &c., and quince blight, I must leave for another article.

For the American Agriculturist.

THE BORER—HOW TO DESTROY.

WESTVILLE, April 12, 1854.

SIR:—Will you please inform me through your paper the best method, or any method, of extirpating the borer, or peach worm, so destructive among many peach orchards by girdling the trees. My plan has generally been to examine the trees about twice a year, and with a hooked knife dig them out completely, but I find this rather a tedious mode, and don't *reduce* their depredations as I would like to. Can there not be some wash or something applied around the collar of the tree to prevent the insect stinging the tree. I have heard that whale oil soap would remedy it, but have not tried it. What is your opinion of it? Please answer immediately and you will oblige a

SUBSCRIBER.

The only effectual way to get the worm or grub out of your peach trees, is to use a knife as you have done, or long sharp awl; and then put about four quarts of slacked lime, mixed with an equal quantity of charcoal dust, coal or wood ashes, around the trunk of each tree. If you cannot get the ashes or charcoal, then use the slacked lime alone. It is rare, after this, that the grub will attack a tree—indeed, they have never done it to any of ours, and we have had eleven years' experience of the remedy. We doubt whether whale oil soap will keep away the peach grub; but it is effectual to mix with water and syringe their leaves and branches for the aphid and some other insects.

NOT SATISFIED.—Lorenzo Dow once said of grasping avaricious farmer, that if he had the whole world inclosed in a single field, he would not be satisfied without a patch on the outside for potatoes.

American Agriculturist.

New-York, Wednesday, April 19, 1854.

BOUND VOLUMES.—We have a few sets (26 numbers) of volume eleventh, bound and unbound. The price, at the office, of the unbound volumes is \$1.00. The bound volumes are neatly put up in cloth covers, gilt backs, at \$1.50.

We can also furnish the covers separately, gilt and all ready for putting in the paper, for twenty-five cents each. With the covers thus prepared, any bookbinder can complete the binding for twenty-five cents. Volumes sent to the office will be bound complete for fifty cents.

We are having printed a new edition of the first ten annual volumes of the monthly *Agriculturist*, which can be supplied for \$1.25 per volume or \$10 for the set of ten volumes.

BACK NUMBERS.—We have taken the precaution to print each week a large number of extra copies, so that we can still supply new subscribers with full sets from the beginning of this volume, (March 15.) Any copies accidentally lost by a subscriber, will be freely supplied. Specimen copies sent to any person, whose address is furnished post-paid.

OUR PAPER.—We again present our readers with nearly thirty articles relating directly to the cultivation of the soil, nearly all of which were written expressly for this paper,—many of them by the editors. Please look them over and see how many hints are thrown out which are practically worth the price of a volume. If any such are found, please show the paper to a neighbor and ask him to partake of the advantages afforded by becoming a subscriber. Our large subscription books are rapidly filling up, but we have room for a few more names.

N. B.—NEW-YORK, *Monday, 11 o'clock A. M., April 17th, 1854.*—We take back all we have said during the last three weeks about putting in spring crops. We thought spring had arrived, but find we were greatly mistaken, for at this hour the ground is covered about a foot deep with snow which is still falling. Our readers will please look up the *Agriculturist* of three weeks ago, and get ready to start again with the new spring, to commence after this second edition of winter is over.

ONE WAY TO RAISE BEETS.

A GARDEN well laid out, with all the vegetables growing in rows, or in imitation of some geometrical figure, presents a fine appearance to the eye, and this practice is to be commended. We have, however, found it advantageous to have a plot of beets in some less conspicuous part of the garden, which was planted more with regard to economy than beauty.

For this purpose we take about a square rod of ground, and as soon as it will do to work it, sow it thickly with some early variety of beets, putting on the seed broadcast, and digging it in with a hoe. If the plants come up very thick, we pull out a part at the first weeding. As soon as they begin to interfere with each other, we pull up a quantity, and boil roots and tops together, and thus have a good dish of greens. The

thinning process goes on almost daily till late in the summer, and this single rod of ground furnishes us an abundance of greens, and there is still left growing a good crop of beets, which have been benefited rather than retarded, by the stirring of the ground while thinning them out. We are aware that the above plan contains nothing new to many, but within the last year we have visited scores of gardens where the only practice was to sow beets in rows, with the seeds at a distance of three or four inches from each other.

PLENTY OF GOOD RADISHES FOR A SHILLING.

We have had an abundance of radishes at all seasons, without devoting a foot of ground to their special cultivation. Our plan has been simply this. As soon as our garden has been plowed and spaded, we have sown over it a small quantity of radish seed, broadcast. The subsequent working and planting of the soil buries these seeds, and as they come up, we destroy them as we would weeds where there is not room for them to grow. But there is always some space between rows or hills of other vegetables, where several plants may be allowed to remain till large enough to pull up for the table. Wherever there is any spare room, we scatter a few seeds when hoeing over the ground to kill weeds. This practice we follow up all through the summer, and a single shilling's worth of seed, thus sown in small quantities, every time we have gone into the garden to work, has furnished us an abundance of young and tender radishes at all times. When early peas come to maturity, we have young beets or radishes growing up on the ground occupied by them, from seeds which were sown during the last hoeing they received.

It is well known that on some soils radishes do not grow well, but by our plan of scattering them in every part of the garden, we have always hit upon some spots just suited to produce the nicest roots. Where they happen to be in the way of other vegetables, or where they produce tough, strong bulbs, we cut them down with the hoe and cover them with earth, and they aid to enrich the ground. Thus used, a comparatively small amount of seed, will yield a more satisfactory and economical supply, than if a special plot were devoted to their cultivation.

DON'T EAT HORSE-RADISH TOO FREELY.

It is almost hazardous to say any thing against a condiment so universally used and relished as this, but a word of caution is needed. Horse-radish is highly stimulate and exciting to the stomach, and this effect is almost always followed by lassitude and weakness. We have met with several cases, where persons have ignorantly used this root so freely as to be scarcely able to labor at all.

Where it is needed as a medicine, a small quantity of horse-radish is doubtless beneficial. But we are quite sure, from considerable observation of its effects upon ourselves and others, that any person using a full spoonful or more, at a meal, will suffer in consequence, although the cause of this suffering may not be perceived, since it produces a stimulating effect for the first hour or two after eating it.

HOW TO PLANT CUCUMBERS, MELONS, AND SQUASHES,

TO AVOID DESTRUCTION BY BUGS.

As the cost of seed is trifling, we have for the past few years always succeeded in getting good vines by the following process: Instead of planting a few seeds in hills at the distance they would ultimately be required to grow, we have put in a large quantity over the whole ground; so that at first we have had a hundred plants where only one was needed. Sometimes we have had a plant come up on every two inches over the whole bed.

As fast as the expanding leaves of the vines interfere with each other, we cut off the weaker ones with a pair of shears, so as not to disturb the roots of those remaining. The "bugs" have always materially assisted in the thinning process, but we have never failed to find twice or thrice the needed number of plants entirely untouched. When beyond the reach of danger from insects, all the weaker plants are removed; and a solitary vine left here and there has been enough to cover the ground.

The same ground will yield much better, by having the vines at equal distances from each other, than if two or three are left together in the same hill, since the roots have more room to grow, and they find a greater amount of nourishment when thus isolated. The fruit will also be more solid and of better quality.

It should also be remembered that air and light are essential to the growth and maturity of the fruit; and it is better to occasionally cut out a thrifty plant, than that the ground be too densely covered. Just vines enough to thinly cover the ground, will produce better than double this number.

EAT LETTUCE SPARINGLY.

Few persons are aware, that a large amount of opium (*Lactarium*) is found in the larger leaves and stalks of lettuce, and that this substance has the properties of the common opium of the poppy. Almost every one, after partaking freely of lettuce, will feel dull and drowsy, though the cause of this drowsiness may not be perceived. A small quantity may produce no immediately injurious effects, but we have little doubt that derangement of the digestive organs, and of the system generally, might often be traced to a too free indulgence in this pleasant salad. We should add, however, that the opium of lettuce, is chiefly found in the milky fluid which exists in the stems and in the older plant. The first very young and tender leaves, with but little of the stems adhering, contain so small an amount of the narcotic, as to be little objectionable.]

PROLIFIC SOUTH-DOWN EWE.—We have seen a ewe of this breed, belonging to Mr. D. B. HAIGHT, of Dutchess County, that is eleven years old this spring, and has just dropped three fine lambs. These make up twenty-two in all, which she has produced within the past nine years. We think this extraordinary for a ewe of any breed.

CHINESE SEEDS.—We lately received from Commodore PERRY, commanding the United States' Squadron for Japan, a quantity of garden and field seeds, in fantastical little jars, her-

metically sealed, and with labels in both Chinese and English. These we have distributed among numerous friends, with a request to have their reports on the success of their cultivation, and hope to hear favorable accounts from them during the summer and fall.

NEW-YORK STATE AGRICULTURAL SHOW FOR 1854.

THE Executive Committee of the New-York State Agricultural Society, adopted a resolution at their last regular meeting, at Albany, April 6th, to hold their next great show at Hamilton Square, in the city of New-York, on the 3d, 4th, 5th, and 6th days of October.

We congratulate the members and friends of the Society, on their having the Show where *all* that desire to witness its various objects of interest, can come with the certainty of finding comfortable accommodations. This has hitherto been a great objection to many who desired to be present, but who have been deterred from the great difficulty, or frequently the utter impossibility, of procuring either comfortable lodgings or table. With the immense number of our hotels and large boarding-houses this objection cannot exist; and we shall look confidently for a throng of visitors to the forthcoming show, hitherto unexampled on the Western Continent.

The facility for getting animals, products, implements, &c., by the converging water-courses and railroads that center in this city, together with the enlarged national feature which we understand is to be adopted for this year, (offering large inducements for the neighboring States to send in their contributions,) will tend materially to increase the interest and swell the number of visitors to the exhibition. We shall be disappointed if the receipts are not double what have ever before been realized by the Society.

AGRICULTURAL SOCIETY OF NEW-LONDON COUNTY, CT.

A CONVENTION was held at Norwich, Ct., April 12th, to reorganize the old New-London County Agricultural Society, which has been defunct some ten years. The old Society had a brief existence, and its demise was so sudden and unexpected, that the cause of its death has never been ascertained. The attendance was respectable, and from a majority of the towns in the county. Much more interest was manifested than was anticipated. Nearly all classes were represented. An M. D. was chosen chairman, and another M. D. secretary, which showed that the Society was to be well *doctored*, and in case of its early death, there should be at least medical advice enough on hand to determine the cause. A clergyman was chosen president of the new society, which perhaps looks still more ominous as to the solicitude felt for the new enterprise. Some of the first men in the county for intelligence and wealth, were put upon the executive committee, and the prospect now looks favorable for an exhibition in the fall worthy of this county.

We were gratified to learn that the experiments made with guano and super-phosphate of lime, had so generally proved successful. A dealer informed us, that almost every one who purchased last year, is purchasing this. One dealer, in Norwich, has already sold one hun-

dred tons of guano, and seventy-five of super-phosphate. Probably not less than 500 tons of these concentrated manures will be used in Eastern Connecticut this season, and if found profitable, this amount will be doubled another year. At this rate it will not be long before New-England will rival Virginia and Maryland in the use of these manures.

A PROPOSITION—SUPER-PHOSPHATE.

THERE is so much opportunity for deception or collusion on the part of manufacturers of various artificial fertilizers, that we have uniformly declined to publish reports of experiments made to test their value, and we have refused to receive samples of any kind of special manures for our own experiments, if we were asked to publish the results. We have no confidence in the specimens put up for such experiments or for analysis; neither do we value the results obtained by the first samples sent into the market for sale, for it is to the interest of manufacturers to furnish a good article at first, even if at a loss. These doubts we have expressed plainly to different manufacturers—to Mr. DE BURG, among the number.

Mr. DE BURG, however, has called upon us, and made a proposition which we think obviates the above objections, and we cheerfully lay it before our readers; and we will with the same cheerfulness give the free use of our columns to any other manufacturer, who will make a like fair and open proposition. Mr. DE BURG's proposition is as follows: He will furnish, at his own expense, three to five hundred pounds (or more if desirable) of his super-phosphate of lime, to any agricultural society, or club, or association of men, who will give it a fair trial, and report the results, favorable or reverse; and mark, *the samples for experiments are not to be taken from the factory, nor from any particular lots, but from any that has been or may be sent into the market. To prevent any chance for deception, those proposing to make such experiments may first select their samples from any they can find in the country, and then apply to Mr. DE BURG, and he will give an order for its delivery to them free.*

We understand Mr. DE BURG has sent out many hundreds of tons to agents in different parts of the country the present season,—of course not all designed for any such special trial as the above,—and we trust that a number of agricultural clubs will each appoint a committee to conduct a course of experiments to test the value of super-phosphate of lime.

We have not the least interest in the success or failure of Mr. DE BURG's manufacture; but as he proposes to subject super-phosphate of lime to a rigorous test at his own expense, we certainly hope the experiments will be carefully and extensively made. If the result happens to benefit himself and others in the like occupation, by this new fertilizer proving to be valuable to farmers generally, we shall be glad of it.

For the American Agriculturist.

OSAGE ORANGE HEDGE.

INFORMATION WANTED.

WE are planting and raising Osage Orange hedges, and we need information on the subject. Several here are raising more or less, and various rumors are afloat as to what is the proper management. Our method is as follows:

We soak the seed two weeks in warm water before sowing, keep the plants clean from weeds during the summer, and letting them stand till spring, when they are transplanted about 6 inches apart, and cut off the next year 3 inches from the ground. I wish some of your readers would tell us if, when the hedge is thin, it will answer to lay the shoots down instead of cutting them off and filling up with plants. If any of your readers can give us a better plan, we shall be most happy to receive the information. We are about to move where timber is scarce, and shall plant hedges, as we wish to make fence as quickly as possible. H. & J. N.

Washington, Tazewell Co., Ill.

We shall be glad to hear from any of our subscribers in answer to the above. We will reprint here some remarks of our own, published on this subject last year, which were as follows:

In 1847 we resolved to try it, and purchased a pint of seed. A close examination convinced us that if it sprouted the season it was planted, it must be soaked. We put it in a steep of water and soot, and put the bowl under the stove, where the water would keep a little warm. There it stood eight days, when we prepared the ground much the same as we should have done for peas, and sowed the seed in drills eighteen inches apart. We had a large crop of weeds before there were any signs of the expected Orange sprouts. But they did come up at last, (six weeks after they were planted,) and after being weeded and hoed, made a thrifty growth—the first season attaining a height of thirty inches. The following spring we dug them up and transplanted them along the inside of the road fence. A large portion of the ground had been made by filling up a ravine that was about four feet deep. We dug a trench, and cutting the plants down to about four inches, set them in it, only six inches apart—at least six inches nearer than they should have been. That season they made a fine growth, and as we were anxious to obtain a high stand, they were not trimmed during the summer, but left until spring, when they were cut back to an even height. This treatment has been continued ever since, and now we have a hedge that no animal would attempt to go through, and there are few men who would succeed. We have never protected it during the winter, and consider it unnecessary to do so.

The Orange is late in putting out foliage, but it retains its leaves longer than any other tree, not excepting the willow. It grows rapidly, and if summer trimmed and properly attended, makes a screen that human eyes cannot penetrate. Some stalks that were allowed free growth last summer made over nine feet of new wood. Transplanted to the lawn as an ornamental shrub or tree, it has few superiors. It can be easily kept in shape; and in any location north of the highlands it will bear fruit—but it will not perfect its seed. When covered with its balls of green fruit, it is a beautiful and interesting object.

MARCH OF IMPROVEMENT.—“My good friend,” said Lord Kaimes to a farmer, “such are the wonderful discoveries of science, that I should not be surprised if, at some future time, one might be able to carry the compost of an acre of land to the field in our coat pocket.” “Very possible,” replied the farmer, “but in that case, I suspect you would be able to bring back the crop in your waistcoat pocket.”

Boys' Corner.

"THE OLD WOMAN."

It was thus, a few days since, we heard a stripling of sixteen designate the mother who bore him. By coarse husbands we have heard wives so called occasionally, though in the latter case the phrase is more often used endearingly. At all times, as commonly spoken, it jars upon the ear and shocks the sense. An "old woman" should be an object of reverence above and beyond almost all other phases of humanity. Her very age should be her surest passport to courteous consideration. The aged mother of a grown up family needs no other certificate of worth. She is a monument of excellence, approved and warranted. She has fought faithfully "the good fight" and come off conqueror. Upon her venerable face she bears the marks of the conflict in all its furrowed lines. The most grievous of the ills of life have been hers; trials untold and unknown only to her God and herself, she has borne incessantly; and now in her old age—her duty done! patiently awaiting her appointed time—she stands more truly beautiful than even in youth! more honorably deserving than he who has slain his thousands, or stood triumphant upon the proudest field of victory!

Young man! speak kindly to your mother, and even courteously, tenderly of her! But a little time, and ye shall see her no more forever! Her eye is dim, her form is bent, and her shadow falls graveward! Others may love you when she has passed away—kind-hearted sisters, perhaps, or she whom of all the world you choose for a partner—she may love you warmly, passionately! children may love you fondly! but never again, never! while time is yours, shall the love of woman be to you as that of your old, trembling, weakened mother has been.

In agony she bore you! through pining, helpless infancy, her throbbing breast was your safe protection and support; in wayward, tetchy boyhood, she bore patiently with your thoughtless rudeness, and nursed you safe through a legion of ills and maladies. Her hand it was that bathed your burning brow, or moistened your parched lip; her eye that lighted up the darkness of wasting nightly vigils, watching always in your fitful sleep, sleepless by your side, as none but her could watch. Oh! speak not her name lightly! for you *cannot live* so many years as would suffice to thank her fully! Through reckless and impatient youth she is your counsellor and solace! Up to a bright manhood she guides your improvident step, nor even then forsakes or forgets? Speak gently, then, and reverently of your mother; and when you too shall be old, it shall, in some degree, lighten the remorse which shall be yours for other sins—to know that never wantonly have you outraged the respect due to "old women."

—Harrisburg Telegraph.

A WORD TO LITTLE BOYS.

Who is respected? It is the boy who conducts himself well, who is honest, diligent, and obedient in all things. It is the boy who is making an effort continually to respect his father, and to obey him in whatever he may direct to be done. It is the boy who is kind to other little boys, who respects age, and who never gets into difficulties and quarrels with his companions. It is the boy who leaves no effort untried to improve himself in knowledge and wisdom every day; who is busy and active in endeavoring to do good acts towards others. Show me a boy who obeys his parents, who is diligent, who has respect for age, who always has a friendly disposition, and who applies himself diligently to get wisdom, and to do good towards others, and if he is not respected and beloved by every body, then there is no such thing as truth in the world. Remember this,

little boys, and you will be respected by others, and will grow up and become useful men.

"How's your Ma?"—This slang expression, which at former times was in vogue, had gone from use and recollection, until brought to mind by a circumstance which transpired a day or two since in the street. A little boy was pushing his way to school with satchel in hand, intent upon his own pursuit, when one who should have been a man in mind as well as in stature, hailed him with, "Boy, how's your ma?"

The lad stopped, eyed his interrogator from head to foot, and then replied: "My ma don't know you, sir. Her acquaintances are gentlemen."

Exit the man of small brains with a flea in his ear.—*Buffalo Express.*

That was a noble boy.—Ed.

Miscellaneous.

LIFE IN GREAT CITIES.

HOW PEOPLE LIVE IN NEW-YORK.

The following article conveys a very truthful picture of life in this city. Those who have not spent months or years in its very midst, have any idea of what daily transpires among the heterogeneous masses that make up our population of three quarters of a million.

City life presents the two extremes of luxury and want, and in this respect New-York is fast becoming an European city. There are no such extremes of life elsewhere in town or country, and the picture of contrasts is anything but pleasant to Christian eyes or agreeable to republican feeling. Some years ago when in the city of Naples, we thought it one of the most disgusting sights we ever beheld, to behold full-grown men, and women too, strong in limbs and in ability to labor, engaged in the miserable occupation of gathering up from the streets and market-places the remnants of old rags and cigars, manure and bones, or whatever human hands could belaid upon. All this had a real value there, where the charming climate, and almost perpetual summer, makes nature as bountiful in yielding the fruits of the earth as it is beautiful in its rich skies, its gorgeous sunsets, and its green fields. The Beggars are a class there, and the Lazzaroni are a class there also, and there is between a class which perhaps we ought to characterize as composed of industrious persons who would be glad to labor, we were told, if they could find work to do.

But we need not go to Naples to find Lazzaroni, Beggars, the extremes between busy men and those who live by their wits, or even those who thrive by gathering up the crumbs, or something worse, which are thrown into the streets. New-York, in this respect, is becoming a picture of the old cities of Europe. Foreigners bring their European trades with them, and they live and thrive upon them, too, disagreeable as they are. We have seen able-bodied persons here, gathering up the bits of cigars thrown into the gutters by the makers, to be made, we suppose, into chewing tobacco, by those who revel in the use of tobacco. Think of that, ye who are wedded to the weed! The Rag Pickers have become almost a profession, and so have the gatherers up, with their iron hooks and long-pronged forks, of the pieces of paper swept into the street. If one-half of the people wonder how the other half live, they have only to behold, in a city like this, nearly one-half living upon what the other half wastes. Every old bone, every rag, every scrap of paper, the very dirt of the street is converted into silver and gold. The half-burnt coal that comes from the grate, the ashes from the fire-place, all are money. The barber sells the very hair

which he cuts from your whiskers and head, the paper-maker buys the old rags and ropes which are cast aside as worthless, and boys and men go about gathering up the old nails, hoops, rods, and scraps of iron and lead which are found and stolen in new and old houses or on the highway. These are incidents of city life, and we only record what the early riser can see any morning of the week. Thousands are thus growing rich daily upon the waste of other thousands, and the rag-gatherer and old cigar-picker of to-day, will be the millionaire of "Upper Tendon," and of the Fifth Avenue to-morrow.

With all this spirit of saving and economy in collecting, there is, nevertheless, a vast amount of professional beggary in the city, confined mainly to the foreign-born citizens. The Italians beg with an earnestness and expression which sometimes borders on phrenzy. They will cling to your knees, kiss your hands, and call down the most eloquent blessings upon your head if you give them aught. The Irish pass from blessing to cursing, with startling facility, which makes one's blood creep in their veins. Who that has ever heard Irish anathemas in old Ireland will ever forget them. "For the love of God, give us a penny to buy bread for the darling child!" Perhaps you frown and refuse, and if you do, you may find your hair standing on end as you hear curses rolling out like a flood. In Dublin, upon the Green, as daylight recedes into the shades of evening, you may see many of these beggars, most of them women, usually with children in their arms as helpmates in the work of petition. They beg eloquently, and they curse frightfully, sometimes invoking "the wrath of heaven," "the anger of the Lord," "deerepid old age," "hunger and nakedness for yourself, wife and little ones."

We have something of this at times in New-York, and from those who can get work and the means of an honest livelihood almost whenever they ask it. But there is hardly a limit to the phases of city life. We have cited but one or two, as we have seen them in our recent walks about town.—*Express.*

EFFECTS OF SIGNING THE PLEDGE.

JOHNSTON'S BAD LUMP.

REV. JOHN ABBOTT, the sailor preacher, relates the following good story of one of his converts to temperance:

Mr. Johnston, at the close of a cold water lecture intimated that he must sign the pledge in his own way, which he did in these words:

"I, William Johnston, pledge myself to drink no more intoxicating liquor for one year."

Some thought he wouldn't stick three days, others allowed him a week, and a few gave him two weeks; but the landlord knew him best, and said he was good stuff, but at the end of the year Bill would be a real soaker. Before the year was quite ended, Mr. Johnston was asked by Mr. Abbott, "Bill, ain't you going to renew the pledge?"

"Well, I don't know, Jack, but what I will; I have done pretty well so far, will you let me sign again my own way?"

"O yes, any way, so that you won't drink rum."

He writes: "I, William Johnston, sign this pledge for nine hundred and ninety-nine years, and if living at the end of that time, I intend to take out a lease for life."

A day or two after, Johnston went to see his old landlord, who eyed him as a hawk does a chicken. "Oh, landlord," whined Bill, accompanied with sundry contortions of the body, as if enduring most exasperating torment, "I have such a lump on my side."

"That's because you have stopped drinking; you won't live two years longer at this rate."

"If I commence drinking, will the lump go away?"

"Yes. If you don't you will have another just such a lump on the other side."

"Do you think so, landlord?"

"I know it; you will have them on your arms, back, breast and head; you will be covered all over with them."

"Well, may be I will," said Bill.

"Come, Bill," said the landlord, "let's drink together," at the same time pouring the red stuff from a decanter into his glass—gug, gug, gug.

"No," said Johnston, "I can't for I have signed the pledge again."

"You hain't though! You're a fool."

"Yes, that old sailor coaxed so hard I couldn't get off."

"I wish the devil had the old rascal—Well, how long do you go this time?"

"For nine hundred and ninety-nine years," whispered Bill.

"You won't live a year."

"Well, if I drink, are you sure the lump on my side will go away?"

"Yes."

"Well, I guess I won't drink; here's the lump," continued Bill, holding up something with a hundred dollars in it; "and you say I'll have more such lumps—that's what I want?"

A FOWL SLANDER.

THE *Peedee Times*, (S. C.), thus discourses of the new "invention":—"We are averse to all big things, except big mountains, and we love them because they are the immediate creation of God, and are indiees pointing to heaven. We never saw a big hog or ox, but had cost more than he came to, in making him grow up to his size. So with big roosters—and in reply to a Shanghai friend, afflicted with the declining *furor*, we here give it as our opinion that two pair of legs attached to small and thrifty fowls, like the Mexican game and Dorking, will sustain and keep in a better condition, more flesh and feather than a pair of gouty stilts under a modern Chinaman. And, too, careful comparison, deduced from the realities of cause and effect, teaches us that, as scratching is one of the elements of good living to a rooster, the smaller breeds, in this particular, have greatly the advantage over the automaton monsters of the poultry-yard. With bountiful crops and good seasons, they may be made to do; but 1853 was wholesale sorrow to practical Shanghai breeders. Give us a Dorking or Mexican game for the spit—a bantam to crow—a turkey to roast, and guinea fowls for eggs, and we will give up all other fowl fancies to those who choose to indulge in them. 'Cock-a-doodle-doo,' was the good old-fashioned smart crow of the roosters in the days of our boyhood—the insupportable 'Come and f-e-e-d me m-o-r-e,' of the Shanghai, is doleful enough to announce the funeral of a corn crib."

A TOUCHING SCENE.—A beautiful infant had been taught to say, and it could say little else, "God will take care of baby." It was seized with sickness, at a time when both parents were just recovering from a dangerous illness. Every day it grew worse, and at last it was given up to die. Almost agonized, the mother begged to be carried into the room of her darling to give it one last embrace. Both parents succeeded in reaching the apartment just as it was thought the baby had breathed its last. The mother wept aloud, when once more the little creature opened its eyes, looked lovingly up in her face, smiled, moved its lips, and in a faint voice said, "God will take care of baby." Sweet, consoling words! they had hardly ceased when the infant spirit was in heaven.

"SAMMY, my son, how many weeks belong to the year?" "Forty-six, sir." "Why, Sammy, how do you make that out?" "The other six are *Lent*." "Mother, put this boy to bed. He's getting too far'ard."

PRETTY GOOD.—The *Cincinnati Columbian* says that Miss Eliza Pretty was married to Mr. John Good on Friday last.

PURGATORY.—An Italian noble being at church one day, and finding a priest who begged for the souls in purgatory, gave him a piece of gold. "Ah, my Lord, said the good father, you have now delivered a soul." The Count threw upon the plate another piece. "Here is another soul delivered," said the priest. "Are you positive of it?" inquired the Count; "I am certain they are now in heaven." "Then," said the Count, suiting the action of the word, "I'll take back my money, for it signifies nothing to you now, seeing that the souls have already got to heaven, and there can be no danger of their returning to purgatory!"

RULES FOR THE JOURNEY OF LIFE.—The following rules, from the papers of Dr. West, are thrown together as general way-marks in the journey of life: Never ridicule sacred things, or what others may esteem as such, however absurd they may appear to you. Never show levity when the people are engaged at worship. never to resent a supposed injury till I know the views and motives of the author of it. On no occasion to relate it. Always to take the part of an absent person who is censured in company, so far as truth and propriety will allow. Never to think worse of another on account of his differing from me in political and religious subjects. Not to dispute with a man who is more than seventy years of age, nor with any enthusiast. Not to affect to be witty, or to jest as to wound the feelings of another. To say as little as possible of myself and of those who are near to me. To aim at cheerfulness without levity. Never to court the favor of the rich, by flattering either their vanities or their vices. To speak with calmness and deliberation on all occasions, especially in circumstances which tend to irritate.

ENEMIES.—A man who has no enemies is seldom good for any thing. He is made of that kind of material which is so easily worked that every one tries a hand in it. A sterling character—one who speaks for himself, and speaks what he thinks—is always sure to have enemies. They are as necessary to him as fresh air. They keep him alive and active. A celebrated person, who was surrounded by enemies, used to say:—"They are sparks, which, if you do not blow them, go out of themselves." Let this be your feeling, while endeavoring to live down the scandal of those who are bitter against you. If you stop to dispute, you do but as they desire, and open the way for more abuse. Let the poor fellows talk. There will be a reaction if you do but perform your duty; and hundreds who were once alienated from you, will flock to you acknowledge their error.

A NEWSPAPER.—A man eats up a pound of sugar, and the pleasure he has enjoyed is ended; but the information he gets from a newspaper is treasured up in the mind, to be used whenever occasion or inclination calls for it. A newspaper is not the wisdom of a man, or two men; it is the wisdom of the age—of past ages too. A family without a newspaper is always half an age behind the times in general information; besides, they never think much, nor find much to think about. And there are the little ones growing up in ignorance without a taste for reading.

Besides all these evils, there's the wife, who, when her work is done, has to sit down with her hands in her lap, and nothing to amuse her mind from the toils and cares of the domestic circle. Who would be without a newspaper.—*Dr. Franklin*.

A SMALL SOUL.—We once heard a Vermont express his opinion of a person in the following style of classics: "I could take," said he, "the little end of nothing, whittle it down to a point, punch out the pith of a horse-hair, put in forty thousand such souls as his, shake them up, and they'd rattle!"

A DEFINITE WITNESS.—An inquisitive lawyer, famous for examining witnesses, had a nice old gentleman, and witty withal, upon the stand, questioning him upon his ability to loan money and give credit, resorting to all sorts of interrogatories to draw from him a statement of the amount of his property and in what it consisted—in fact how much he was worth. The old gentleman considering the questions rather impudent, for he was quite wealthy, answered that he had a wife, he always called her dear—a boy and girl that he would not sell for any money—a mortgage on two cows down east—a nice litter of pigs and the mother of the same—a barrel of cider that never saw daylight, and "a puppy that knows more than you do, for which I have been offered twenty-five dollars!"—*Boston Post*.

BADLY CORNED.—A traveler, fatigued with the monotony of a long ride through a sparsely settled section of the country, rode up to a small lad who was engaged in trimming and dressing out a sickly-looking field of corn, and relieved the oppression of his spirits, thus:

"My young friend, it seems to me your corn is rather small."

"Yes, daddy planted the small kind."

"Ah, but it appears to look rather yellow, too."

"Yes, sir, daddy planted the yallar kind."

"From appearances, my lad, you won't get more than half a crop."

"Just half, stranger—daddy planted it on halves."

The horseman proceeded on his way, and has not been known to speak to a boy since. He considers them bores.

It is said that Sir Charles Napier told some one, on the night of the reform dinner, that in three weeks from that date he "would either be in St. Petersburg or in heaven."

We believe too much in the doctrines of Quakerism to think that a vessel of war armed to the teeth, and bent on a mission of destruction, is just the packet to take passage in for heaven.—*Providence Journal*.

PLOWING OFTEN.—Often breaking up a surface keeps a soil in health; for when it lies in a hard-bound state, enriching showers run off, and the salubrious air cannot enter.

RATHER MULISH.—Paris, Kentucky, is the greatest live stock market in the West. Eight hundred and thirty mules were recently sold in one day.

FALLACY OF AN OLD AXIOM.—To say "as different as chalk is from cheese." When we consider that cheese is made from milk, and milk is made from chalk, there is not such a great difference after all.

FAST ANCHORED.—One of the Albany editors says, that the only reason why his house was not blown away in the late gale was, that it had a heavy mortgage upon it!

WHILE in America the proportion of persons who go to school of some kind is one in five, in Russia it is one in two hundred and twenty!

CORN BREAD.—A NEW RECIPE.—Every body who has been at the Mansion House, Buffalo, N. Y., has learned the luxury of the corn bread there provided. The clerk is often taxed to write direction for home manufacture, and I thus procured a recipe for domestic use, which I copy for you, so that those who wish may try a piece of bread from the Mansion. It is as follows: One quart of sour milk, two table-spoonfuls of saleratus, four ounces of butter, three table-spoonfuls of flour, three eggs, and corn meal sufficient to make a stiff batter.

PROFANE WIT.—It is now-a-days so much the fashion to be witty at the expense of religion, that a man will hardly pass for a genius if he does not allow his impious satire to run a-tilt at its most sacred truths. The noble simplicity of Holy Writ must needs be abused, and turned into ridicule at the daily assemblies of the so-called wits; for what is there so holy and so serious that will not raise a laugh if a false sense be attached to it.—*Schiller*.

A boy was asked what meekness was. He thought a moment, and said: "Meekness gives smooth answers to rough questions."

SPECIAL NOTICE TO ALL SUBSCRIBERS.

We find that by using such good paper, our volume of 832 pages will be quite large to bind, and especially large for those who wish to stitch their paper together with an index, without being at the expense of binding. To obviate this, we have concluded to be at the expense and trouble of making out an extra index with No. 26, so as to form a complete volume of the first 26 numbers. The index for the next 26 numbers will be given at the end of the year, or with No. 52. This arrangement will make it convenient for all, as the 52 numbers can be stitched or bound in two volumes with an index for each, or in one volume with the double index at the close.

We hope all will preserve their numbers, for there are many single articles each of which will be worth the price of the volume, for future reference. When the paper arrives from the post-office, a good plan is to see that it is properly folded, and then pin or sew it through the middle and cut open the leaves. It is very easy to stitch 26 numbers together. To do this, arrange them in regular order, and with an awl punch several holes about one-fourth of an inch from the back, and through these run a strong thread two or three times with a darning-needle, and the work is done. We have scores of volumes of papers, pamphlets, and addresses, thus prepared, which serve all the purposes of a bound volume, and occupy less room in storing and carrying. We would, however, prefer to see volumes of agricultural papers neatly bound and laid upon the book-shelves or tables of farmers. They are much better and more appropriate ornaments, than gilded volumes of trashy magazines or novels.

ONE WORD MORE.—We thank our friends for the liberal aid they have afforded us in extending the circulation of the *Agriculturist*. Our list has increased beyond our expectation, and we are daily encouraged to labor with the utmost diligence, to make our paper worthy of the confidence and admiration of our largely increasing list of readers. Our reliance for the continuance and increase of our list is upon those who are already readers. As stated above, we now divide the year so as to give either one or two complete volumes of the 52 numbers. Number 27 begins the second volume, or half of the year. We respectfully request all our present subscribers to make a little exertion at this time, and each send us on at least one new name. If you cannot get your neighbors to send on for a year, ask them to try the paper for six months, as in that time they will get a complete volume.

TO CORRESPONDENTS.—We have several communications on hand which we will look over as soon as we have time, and some of them will be published. It is no trifling labor to prepare for the printer many communications which we receive. Some are written so closely that there is not room to put in corrections, without re-writing the whole. We cheerfully prepare articles, unless there is manifest want of care on the part of the writer. If he does as well as he can, we make all needful changes and corrections.

As most writers doubtless wish to improve their own style, we suggest to them to keep an exact copy of their communications, and then

compare this copy with the printed sheet. They may often learn something in this way.

We are not anxious to receive original poetry. We have little space for rhyme, and we have good selections enough to last us a year at least. Good poetry, however, will not be rejected; but we advise all who attempt to write in verse to remember, that good *rhyme* does not constitute good *poetry*; on the contrary, some of the best *poetry* we have ever seen does not "*rhyme*" at all, while some of the best *rhyme* contains not a single *poetic* sentiment.

Markets.

REMARKS.—Our advices from Europe are to the 4th of this month. Flour and grain have advanced there considerably in price, and the rise has produced a corresponding effect upon our market. The advance in flour the past week has been fifty cents to one dollar a barrel. The actual declaration of war against Russia by the allied powers, with the consequent devastation and suspension of commerce, will tend to raise the price of grain still higher. We can hardly judge as yet of the effect upon our market of the western stores of grain that will arrive upon the opening of canal navigation. The severe snow storm now prevailing will put back spring crops considerably. We think farmers may at least expect remunerative prices during the coming season.

Cotton has again fallen about one-half cent. per lb. during the past week, and sugar has not improved in price.

REVIEW OF THE BRITISH CORN TRADE.

[SINCE the following was in type we have received four days later intelligence from England. During this short time a considerable advance had taken place in Bread Stuffs.—Eds.]

From the Mark Lane Express, March 27th.

The official account of the imports into the United Kingdom during the month ending 5th inst., has just been published. The entire quantity of Grain and Pulse received has amounted to 487,999 qrs.; whereof 283,461 qrs. consist of Wheat, and 116,455 qrs. of Indian Corn. Of Flour and Meal the total is 400,505 cwts.; 393,306 cwts. being Wheaten Flour.

This return does not embrace the enormous arrival of American Flour at Liverpool during the week ending 13th inst., nor any portion of the large shipments of Wheat made from the Baltic at first open water, and which have only reached our shores during the last ten days. The extent of the supply confirms the opinion which we have always maintained, that however great our wants may be, make the inducement to consign sufficient, and adequate supplies will be forthcoming.

Individuals will, no doubt, be sufferers by the present state of affairs; but, if quotations had not been advanced in this country as to afford encouragement to foreign merchants to collect all they could, (in many cases at considerable expense,) we should at present, in all probability, have had to complain of scarcity rather than abundance. That the important decline which has taken place during the last month or two will tend to check supplies cannot be doubted. This will not be immediately felt; but we have no hesitation in stating that the effect will be as sure as that which was caused by the somewhat too rapid rise three months ago. To the latter circumstance the plentiful character of the supply is clearly traceable; and a period of comparative scarcity is almost certain to be the consequence of the present serious fall.

The dull reports from Mark Lane have naturally had considerable effect on the trade at all the leading provincial markets, and the reduction in the value of Wheat has, since our last, amounted to 2s. to 5s. per qr. The fall has been greater at the ports on the coast than at the markets in the agricultural districts, owing to the smallness of the deliveries from the growers.

The weather has continued highly auspicious for the sowing of Lent Corn, and in many districts the work is being brought to a close. Farmers are, therefore, no longer so closely engaged in the fields as they have been, but no increase has taken place in the home supplies.

The last account of the quantity sold at the towns returning the average price for the Kingdom, is 53,000 qrs. for the week, against 90,000 qrs. in the corresponding week last year. Surely this ought to be regarded as a proof that the deficiency of the last crop was not exaggerated.

Our own opinion on that point has not undergone the slightest change. What we stated last autumn we now repeat, viz., that the produce of Wheat of the United Kingdom in 1853 was at least one-fourth, and probably one-third, short of an average. Nothing has occurred to lead us to doubt the correctness of this view; and we are therefore of opinion that, notwithstanding the extent of the imports thus far, we shall yet require very large supplies from abroad. This being our conviction, we do not think that the present depression will prove of long continuance. We have never shown any disposition to encourage the extravagant ideas in respect to price entertained by many; but at the same time, it would not be safe to conclude, because we have a momentary glut of supply, that all danger of scarcity is past. It is true that good stocks of Wheat and Flour are held at London, Liverpool, and a few other large ports; but the country is otherwise comparatively bare of Wheat. The trade—we mean the millers and bakers—have been working out of stock, in anticipation of the large arrivals which are now at hand. Some of the largest millers, who have imported direct, may not require to buy; but this is the exception; the great majority have been waiting for supplies, and are prepared to purchase so soon as they consider that the right period has arrived. This may be delayed a few days, or a few weeks; but we certainly calculate on an early revival in the demand.

The reported prohibition of exports from the Black Sea and Azoff, which we noticed last week, has been confirmed; and a telegraphic dispatch from Odessa states that the same was being so stringently enforced that vessels which had not completed their cargoes when the time allowed expired (13th inst.) had been compelled to discharge before they were permitted to leave the port. It is certain, therefore, that we cannot expect to receive any further supplies from that quarter beyond what is now on passage, and this is very much less than was the case at this time last year.

The Emperor of Russia having refused to return any reply to the *ultimatum* of the Western Powers, hostilities will, probably, be forthwith commenced in the Baltic as well as in the Black Sea. War will, of course, interfere with the regular course of trade, and also with supplies even from neutral ports.

PRODUCE MARKETS.

Wholesale prices of the more important Vegetables, Fruits, &c., at the principle New-York Markets.

April 15, 1854.

In our weekly reports we give the prices which producers actually get, and not the prices at which produce is sold from the market.

VEGETABLES.—Potatoes, Western Reds, @ bbl., \$2 25 @ \$2 50; Junes, \$2 75 @ \$3; Mercers, \$3 25 @ \$3 50; Carrots, \$3 25 @ \$3 50; Merinos, \$2 25 @ \$2 50; Beets, @ bbl., \$2 50; Carrots, @ bbl., \$2 50; Turnips, white, @ bbl., \$2; yellow, \$2 25; Spinach @ bbl., 2 50; Rape Sprouts, @ bbl., \$2; Onions red, @ bbl., \$1 75; white, \$3; yellow \$2; Parsneps, @ bbl., \$1 75; Lettuce, @ doz. bunches, 25c. @ \$1; Radishes, @ doz., 32c. @ 42c.; Asparagus, @ doz., \$4 50; Parsley, @ doz., 62c.; Leeks, @ doz., 75c.; Vegetable Oysters, @ doz., \$1.

FRUITS.—Apples, very few of any kind in market; a good article is worth \$4, and those of a poorer quality from \$3@ \$3 50 per bbl. Maple Sugar is worth from 10c.@12c. per pound. Butter, Ohio, from 12½c.@14c. per pound. New-York old butter from 16c.@20c.; new, from 23c.@28c. per pound. Eggs, 16c. per dozen.

NEW-YORK CATTLE MARKET.

Monday, April 17, 1854.

THE number of cattle in market to-day is about the same as last week, but these were of a poorer quality. The sales were rather slow, many butchers leaving without making any purchases at all, whether on account of the storm or of the prices we could hardly tell, but probably influenced a little by both. The prices are about the same as last week.

Lowest price, 8c.; Middling, 9½c.; Best, 10½c.

Washington Yards, Forty-fourth street.

A. M. ALLERTON, Proprietor,

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY
Beeves, 2,320	2,146
Cows, 7	
Sheep, 409	
Swine, 655	
Veals, 814	

Of these there were forwarded by the Harlem Railroad, beeves, 11; cows, 7; sheep, 409; veals, 814.

By the Hudson River railroad, beeves, 800.

By the Erie railroad, beeves, 800; swine, 655.

New-York State, furnished by cars, 193.

Ohio, by cars, 852.

Pennsylvania, on foot, 161.

Kentucky, by cars, 659; on foot, 100.

Illinois, by cars, 148.

Hudson River Boats, 200.

The prices are quoted the same as last weeks: Cows, \$30@ \$65; Sheep, \$3 50@ \$7; Extra, \$10@ \$14; Swine, corn fed, 5½c.; Mast, 4½c.

CHAMBERLIN'S, Robinson street.

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY.
Beeves, 100	
Cows and Calves, 30	25
Sheep, 1,000	
Veals, 100	

BROWNING'S, Sixth street.

Beeves, 154
Cows, 62
Sheep, 1,194

O'BRIEN'S, Sixth street.

Beeves, 70
Cows, 90

Mr. CHAMBERLIN gives the following prices: Beef, \$8@ \$10 per hundred—sales rather slow; Cows, \$25@ \$50, some very choice, \$75; Sheep, \$4, \$5@ \$7; Veals, 5@ 6½c. and all sold. Mr. MORTIMER reports the prices of sheep at 7c. per pound alive, and from 12 to 14c. in the carcass. There are very few in market, and the demand is large.

ADVERTISEMENTS.

Advertisements for the American Agriculturist must be paid for in advance.

SEACOR MAMMOTH BLACKBERRY. (BY SOME CALLED THE LAWTON BLACKBERRY.)—LEWIS A. SEACOR, the first discoverer and propagator of this rare and valuable fruit, respectfully informs the public, that although having thus far lost the honor of giving name to his fruit, yet he has on hand about one hundred fine plants of the original stock, from which others have chiefly been derived. These plants he will warrant of superior quality, and will sell them at \$5 per dozen, (which is half the price asked by those who procured their original plants of him at a low price.)

LEWIS A. SEACOR, New-Rochell, N.Y.

COWS WANTED.—COWS FRESH MILK AND WARRANTED to give fifteen quarts at least per day, and to hold their milk well. They must be gentle and orderly, and not over six years old. No matter what the breed is. Please name lowest price. Address J. C. Post-office, New-York, box 2422.

VIRGINIA LAND FOR SALE.

A S COUNSEL AND AGENT FOR THE HEIRS OF DAVID ELLINGTON, dec'd, I offer for sale a tract of land containing about 1000 acres, lying in Prince Edward Co., Va., on the Richmond and Danville R.R., about 4 miles above its junction with the South Side Railroad. Its location, with respect to the two Railroads, gives it every necessary market facility. The soil is naturally free, and is susceptible of a high state of improvement, but for the last 13 years it has been lying in a neglected state, during a controversy (now recently determined) in respect to the will of the former owner. The present owners reside in several of the Western States, and for this reason it will be sold at a great bargain. One or more skillful and enterprising farmers from some of the Northern States would find a profitable investment in this land. The quantity of timber land is amply sufficient for all the purposes of the farm. Besides the adaptation of soil to the cultivation of tobacco, and all the usual grain crops of the country, it is probable that the hay crop can be made easy and profitable, in consequence of the large quantity of bracken flat. It is estimated that the aggregate length of the small streams which water the tract, is from ten to twelve miles! Further particulars will be given, when requested, by the undersigned whose address is "JEFFREY'S STORE P.O., NOTTOWAY CO., VA." Persons desirous of examining the land can easily do so as it is within two days' travel from the city of New-York.

April 6, 1854.

W. C. KNIGHT.

CRANBERRY VINES.—100,000 FINE BEARING PLANTS, of the Bell variety, which are commonly raised in New-England. On low ground, with a little care, they bear large crops. They can be forwarded at any time between this and the middle of May, to any part of the United States. A circular, with mode of culture, soil, and price, will be forwarded to all who may want information in the subject.

TROWBRIDGE & THOMPSON, [32-34] New-Haven, Ct.

PORTABLE FORGES AND BELLOWES.

QUEEN'S PATENT. THE BEST Forge in the market for Blacksmiths work, Boiler Makers, Mining, Quarrying, Shipping, Plantations, Contractors on Railroads, and Public Works, Copper Smiths, Gas Fitters, &c., &c. Also an improved PORTABLE MELTING FURNACE for Jewellers, Dentists, Chemists, &c., both of which are constructed with sliding doors to protect the fire from wind and rain when used out of doors, and for perfect safety and free escape of smoke indoors. They are compact for shipping. Circulars, with particulars and prices, will be forwarded upon application. Cast Iron Columns for buildings constantly on hand. The above forge has been awarded three Silver Medals by the American Institute, New-York, and the highest premium (Diploma and Bronze Medal) at all other Fairs wherever exhibited.

FRIDDERICK P. FLAGLER, Sole Manufacturer, 210 Water st., N.Y.

31-57

KETCHUM'S IMPROVED MOWING MACHINE WITH entire change of gear. The only successful mower now known.

Ketchum's Improved Machine, which we are building for the harvest of '54, was thoroughly tested last season, and the advantages gained by our change of Gear are in all respects as we designed, viz: durability, convenience and ease of action. The shafts now have bearings at both ends, which overcomes all cramping and cutting away of boxes. A counter balance is attached to the crank shaft, which gives it a steady and uniform motion. Each Machine can be thrown out of gear; there is great convenience in getting at each and every nut, all of them being on UPPER SIDE OF THE FRAME; oil cups are attached to all the bearings, which, by the use of a wad of cotton, will hold oil for a long time, as well as protect the bearings from dust, grit, &c.; the finger bar is lined with iron its full width, which protects it from wear.

These and various other additions for strength, durability, &c., makes them the most simple and perfect agricultural implement in use. They weigh about 750 lbs. each, and can easily be carried in a one-horse wagon.

They will cut ALL KINDS OF GRASS, and operate well on uneven or rolling lands, or where there are dead furrows. This Machine took the highest award, with SPECIAL APPROPRIATION, at the World's Fair, it also received, during last season, one silver and four gold medals, and various other flattering and substantial testimonials of approval. We have spared neither pains nor money to make them deserving of public favor, and hope to be able the coming season to supply the great and increasing demand.

We take this occasion to caution farmers against buying EXTENSIVE Mowers, if they do (as was the case with many last year) they incur loss, vexation and disappointment.

IN ALL cases where Extras are wanted, be sure to give us the NUMBER OF YOUR MACHINE.

(WARRANTY.) That said Machines are capable of cutting and spreading, with one span of horses and driver, from ten to fifteen acres per day of ANY KIND OF GRASS, and do it as well as is done with a scythe by the best of mowers.

All orders filled by the subscribers. Office and Shop, corner of Chicago street and Hamburg Canal, near the Eastern R. R. Depot, in Buffalo N. Y.

HOWARD & CO.,

Manufacturers and Proprietors,

For Sale by R. L. ALLEN, 189 Water street, N. Y.

A CHOICE ASSORTMENT OF FLOWER SEEDS. 29-41

SALE OF STOCK.

PURE BRED STOCK AT PRIVATE SALE AT MOUNT Fordham, Westchester Co., New-York, Eleven Miles from City Hall, N. Y., by Harlem Railroad Cars.

Having met with more success than I anticipated the past year, with the catalogue of animals at Private sale, is the reason for offering this lot of animals. AND MY JUNE SALE BY AUCTION, WILL NOT TAKE PLACE. A full descriptive Catalogue with prices attached, will be published on the fifteenth of April, and I intend to be at home myself to see any who may call. I will sell at private sale, about 18 Short-Horns, 6 of which are young Bulls and Bull Calves. The Cows and Heifers old enough, will be in Calf, to the Celebrated "ROMEO," winner of the first Prize at Saratoga, in 1853; and also at American Institute the same year.

The young Bulls and Bull Calves, are some of them from imported Cows, and sired in England; and others are sired by the imported Marquis of Carrabas, (1789,) winner of the first Prize at Saratoga, the past year, as a two year old.

Also, about 10 head of Devons, consisting of a yearling Bull, sired by M. J. O. and 5 Head of Calves, sired by my imported first Prize Bull, FRANK QUARTLY, and several of them from imported Cows and Heifers old enough, will be in Calf to FRANK QUARTLY, and 6 or 8 Suffolk Sows; and several young Suffolk and Essex Boars. Also, 2 South-down Rams, imported direct from Jonas Webb; and 6 Yearling Rams, all bred by me, from Stock on both sides, imported from Jonas Webb. Catalogues will be forwarded by Mail if desired.

All Animals delivered on SHIPBOARD, or RAIL CAR in the City of New-York, free of expense to the purchaser. The Devons are at my Herdsdale Farm, 12 miles north, to which place I will take persons both to and from.

MY FRIEND MR. N. J. BECAR, who is interested in several of my Importations, will also sell about 10 head of Short-Horns, consisting of 4 young Bulls, and 5 or 6 Females. His young Bulls are also several of them from imported Cows, and sired by the LORD OF ERYL HONE, (2205,) and the celebrated first Prize Imported Bull, ROMEO. Mr. Becar's Cows and Heifers are in Calf to the imported Bull, MARQUIS OF CARRABAS, (2789.) Mr. Becar can be seen at his Store, No. 187 Broadway, New-York, at which place he will make arrangements to go to his Farm, at Smithtown, Long Island. His animals will be entered in the same Catalogue with mine, which can be obtained by addressing him at his Store, or me at Mount Fordham. His animals will be delivered in the same manner as mine. Our Importations have been in almost all cases made at the same time, and are of equal merit, excepting that I have more in number.

L. G. MORRIS.

TERMS, Cash on delivery.

March 16th, 1854. 29-37

By James F. W. Johnston. With an Introduction by John P. Norton.

26-29-31-33

MORRIS FEMALE INSTITUTE.

THIS INSTITUTION IS SITUATED AT MORRISTOWN, N. J., about an hour and a half's ride from the city of New-York, on the Morris and Essex railroad; the cars leaving New-York several times a day. It has been ably patronized for the last six years. There will be a vacancy for a few more pupils in April.

Faithful teachers are provided for English branches usually required; also Drawing and Painting. French, Latin, and Spanish under a native teacher.

Vocal and instrumental music by an accomplished player, whose time and attention has been for years devoted exclusively to this object.

Further particulars, and circulars, may be obtained by applying to J. A. SEELYE, Principal, or at the book-store of Messrs. C. Shepard & Co., 152 Fulton street, near Broadway, or at this office.

Persons wishing to send their daughters from home, would do well to visit this Institution before deciding. 27-1f

MUSQUIT GRASS.

THE TRUE MUSQUIT GRASS, GROWN BY A CAREFUL Georgia Planter. This has proved the most sure and valuable grass for stock yet cultivated at the South, and is invaluable to the planter. For sale by

RICHARD PETERS, Atlanta, Ga.,
also by
R. L. ALLEN, 189 and 191 Water St., N.Y. 27-1f

2-3 Catalogues now ready. 28-33

NO. 1 SUPERPHOSPHATE OF LIME.—THIS VALUABLE fertilizer has been used for several years in England and other parts of Europe, and, next to Guano, holds the highest rank in popularity, and the extent to which it is used among farmers. Its introduction in this country has been more recent; but the progress it has made in the estimation of the public has not been less marked or successful than abroad. It is now extensively used throughout the Northern States, after a full trial and investigation of its merits; and it is rapidly becoming, like its predecessor, Guano, a favorite manure at the South and West.

It is composed of crushed or ground bones, decomposed by the addition of about one fifth their weight of sulphuric acid, diluted with water, to which is added the proportion of guano and sulphate of ammonia. The latter is the active and one of the most efficient agents in the best Peruvian Guano.

It is suited to any soil in which there is not already a full supply of the phosphates, which is seldom the case. All crops are benefited by its application.

For sale in large or small quantities, in bags of 150 lbs. each. No charge for packages. All bags will be branded "C. B. De Burgh, No. 1 Superphosphate of Lime."

PERUVIAN GUANO of best quality.

AGRICULTURAL and HORTICULTURAL IMPLEMENTS of all kinds.

FIELD and GARDEN SEEDS, of various sorts, fresh home grown and imported.

THE AMERICAN AGRICULTURIST—weekly, \$1 per volume—two volumes a year.

For sale at R. L. ALLEN'S Agricultural Warehouse and seed Store, 189 and 191 Water street, New-York. 25-1f

ATKINS' SELF-RAKING REAPER.—40 of these machines were used last harvest in grass or grain or both, with almost uniformly good success, in nine different States and Canada. TWENTY-SIX PREMIUMS, including two at the Crystal Palace, (silver and bronze medals,) were awarded it at the autumn exhibitions. I am building only 300, which are being rapidly ordered. Mr. Joseph Hall, Rochester, N. Y., will also build a few. Early orders necessary to insure a reaper.

Price at Chicago \$175—\$75 Cash with order, note for \$50, payable when reaper works successfully, and another for \$50, payable 1st December next with interest. Or \$160 cash in advance. Warranted to be a good Self-Raking Reaper.

Agents properly recommended, wanted throughout the country. Experienced agents preferred. It is important this year to have the machines widely scattered.

Descriptive circulars with cuts, and giving impartially the difficulties as well as successes of the reaper, mailed to post-paid applications. J. S. WRIGHT.

"Prairie Farmer" Warehouses, Chicago, Feb., 1854. 23-35

GARDENER FOR THE GREEN-HOUSE AND GRAPE-HOUSE.—Wanted a Gardener as above, who is experienced in the management of the Green and Grape-House in the United States. None need apply except fully qualified.

A. B. ALLEN, 189 and 191 Water st. 22-1f

GARDEN IMPLEMENTS.

HEDGE, LONG-HANDLE, AND SLIDING PRUNING SHEARS; Budding and Edging Knives; Pruning Hatchets, saws and knives; pruning, vine and flower scissors; bill and Milton hooks; lawn and garden rakes; garden scufflers, hoes of great variety, shovels and spades; hand engines, which throw water forty feet or more, syringes and water pots; grafting chisels, tree scrapers, and caterpillar brushes; transplanting trowels, &c.; hand plow and cultivator, very useful to work between rows of vegetables, together with a large assortment of other implements too numerous to mention. [216]

R. L. ALLEN, 189 and 191 Water st.

FOR SALE AT THE SOUTH NORWALK NURSERY, THE Great New Rochelle or Lawton Blackberry Plants; also plants of the White-fruited Blackberry. For sale also a large stock of small plants of the new or North River Red Antwerp plants, at the low price of fifteen dollars per thousand. The above plants all warranted.

GEO. SEYMOUR & CO.,
South Norwalk Nursery, Conn. 24-36

POUDRETTE.

THE LODI MANUFACTURING COMPANY OFFER their Poudrette for sale in lots to suit purchasers, from a single barrel up to 4000 barrels, at their usual rates, \$1 50 per barrel for any quantity over seven barrels, delivered on board of vessel in the city of N. York, free of cartage or other charge. When 200 or 300 barrels are taken, a deduction will be made from the above price. That this article has stood the test of fourteen years trial is proof of its efficacy. It is the cheapest and best manure for corn ever produced, and it has the advantage of being useful in small quantities and harmless in large. It is a capital manure for peas, strawberries, &c., and all garden vegetables. Apply by letter or personally to the Lodi Manufacturing Company.

22-34 74 Cortlandt st., New-York.

AGRICULTURAL IMPLEMENTS.—THE SUBSCRIBER keeps constantly on hand, and offers for sale the following valuable implements:

Fan Mills of various kinds, for rice as well as wheat, rye, &c. Grain Drills, a machine which every large grain planter should possess. They are of the best patterns, embracing most valuable improvements.

Smut Machines, Pilkington's, the most approved for general use. Hay and Cotton Presses—Bullock's progressive power-presses, combining improvements which make them by far the best in use.

Grain mills, corn and cob crushers, a very large assortment of the best and latest improved kinds.

Horse Powers of all kinds, guaranteed the best in the United States. These embrace—1st. The Chain Power, of my own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, and economy. They are universally approved wherever they have been tried. 2d. The Bogardus power, for one to four horses. These are compact, and wholly of iron, and adapted to all kinds of work. 3d. Eddy's Circular Wrought Iron Power, large cog-wheels, one to six horses, a new and favorite power. 4th. Trimble's Iron-Sweep Power, for one to four horses. 5th. Warren's Iron-Sweep Power, for one or two horses.

GRAIN MILLS, STEEL and CAST IRON MILLS, AT \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES.—FOR MAKING DRAINING TILES OF all descriptions and sizes.

WATER RAMS, SUCTION, FORCE, and ENDLESS-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL KINDS, MADE EXPRESSLY for the California and Oregon Markets.

DRAINING TILES OF ALL FORMS and SIZES.

CLOVER and TIMOTHY SEED HARVESTER.—A newly-patented machine, will harvest 10 or 12 acres per day with one horse.

HAY and COTTON PRESSES.—BULLOCK'S PROGRESSIVE POWER PRESSES, combining improvements which make them by far the best in use.

THRESHERS and FANNING-MILLS COMBINED.—OF Three Sizes and Prices, requiring from two to eight horses to drive them, with corresponding horse powers. These are the latest improved patterns in the United States.

SOUTHERN PLOWS.—Nos. 10 1/4, 11 1/4, 12 1/2, 14, 15, 18, 18 1/2, 19, 19 1/2, 20, A 1, A 2, 50, 60, and all other sizes.

CORN-SHELLERS, HAY, STRAW, and STALK-CUTTERS. Fanning-Mills, &c., of all sizes.

1-1f R. L. ALLEN, 189 and 191 Water street.

FERTILIZERS.

PERUVIAN GUANO.—First quality of Fresh Peruvian Guano, just received in store.

R. L. ALLEN, 189 and 191 Water st., N.Y.

SUPERPHOSPHATE OF LIME, OR CHEMICAL MANURE.—100 tons Paterson's Improved, skillfully made of the best materials, and for sale at lowest rates, by HASKELL, MERRICK & BULL, Importers of Artificial Manures, Wholesale Agents for the Manufacturer, No. 10 Gold street. 1-31

HORSE MARKETS.

BULL'S HEAD SALE and EXCHANGE STABLES, TWENTY-FOURTH STREET, West side of Third Avenue, N. Y. A. S. CHAMBERLIN, Proprietor. 1-34

HAIR RESTORERS, &c.

BARKER'S CHEVEUXTONIQUE.—THIS IS AN ENTIRELY new article, concocted for the purpose of Preserving, Restoring, and Beautifying the Hair, and, unlike most preparations designed for the same objects, it is free from all grease, so that its application cannot soil the most delicate fabric. As an eradicator of Dandruff it is unequalled, while its infallibility in cases of headache, easing the most violent in a few moments, cannot fail to commend it to universal appreciation. The Cheveux-tonique is for sale by all the respectable druggists and fancy stores throughout the city. The depot for its sale, wholesale and retail, is at BARKER'S Ladies' Hair-dressing Establishment, No. 439 Broadway. 2-48

HORTICULTURAL.

FRUIT and ORNAMENTAL TREES and PLANTS.—Including every thing necessary to the Garden, Green-house, Nursery, and Orchard, with all the recent introductions, at very low rates. Descriptive price Catalogues gratis. Carriage paid to New-York. Ornamental and other planting done in any part of the country. The best season for transplanting is after Oct. 10. Address R. M. WATSON, Old Colony Nurseries, Plymouth, Mass. 8-59

WACHUSETT GARDEN and NURSERIES.

NEW-BEDFORD, MASS., ANTHONY & McAFEE, PROPRIETORS. Successors to Henry H. Crapo, would invite the attention of the public to their extensive stock of Fruit and Ornamental Trees, Flowering Shrubs, Rose Bushes, &c.; Evergreens, Balsam Firs, American and Chinese Arbor Vitae, Cedrus Deodara, Cryptomeria Japonica, Norway Spruce, Yew Trees, Tree Box, &c., an extensive assortment of Apple, Pear, Plum, Cherry, Peach and Apricot Trees.

The stock of Pear Trees is very large, both on Pear and Portugal Quince Stocks, embracing every thing worthy of cultivation. All our Pear Trees are propagated and grown by ourselves, and

WARRANTED TRUE TO NAME. The soil, climate, &c., of this locality being so favorable to the Pear, our trees are unrivalled for HEALTH, vigor of growth, &c., &c.

They are all free from that destructive malady THE PEAR BLIGHT, which has never existed in this locality.

Prices low, and a liberal discount to the trade. New-Bedford, Jan. 1st, 1854. 17-68

and 191 Water street.

STOCK.

IMPROVED STOCK OF ALL KINDS.—HAVING HAD a great experience in breeding and rearing fine stock for the past twenty years, I offer my services to my friends to procure it of the best and most reliable kinds. As much notice as convenient is at all times desirable previous to purchasing, as it takes time to make good selections. Early in August or September is the best time to purchase for the South.

Short Horn or Durham cattle, Devons, Herefords, Alderney or Jersey and Ayrshires. Long-wooled Sheep—the Cotswold, Oxford, Leicester, Bakewell, and Lincoln. Mutton Sheep—the Southdown, Fine-wooled Sheep—such as the Saxons, Spanish, and French Merino.

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, which are spurious.

1-1f A. B. ALLEN, Nos. 189 and 191 Water street.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master, and ask him to mark the envelope, *Registered by—, P. M.*

Those wishing their papers changed from one office to another, should give the name, county, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The *American Agriculturist* will be furnished

with Harper's Magazine, one year for	\$4 00
" Putnam's do	4 00
" Knickerbocker do	4 00
" Eclectic do	6 00
" Little's Living Age do	6 50
" National Magazine do	3 50
" Dickens's Household Words	3 50

Address ALLEN & CO.,
189 Water street, New-York.

J. A. GRAY, Printer, 95 and 97 Cliff street, N. Y.

PUBLISHERS' ANNOUNCEMENT!

Twelfth Volume of

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B. The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon its *own merits*; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammeled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDD, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers,	-	-	\$2.00 a year,	\$2.00
" Clubs of 3 do.	-	-	1.67 "	5.00
" do. 5 do.	-	-	1.60 "	8.00
" do. 10 do.	-	-	1.50 "	15.00
" do. 20 do.	-	-	1.25 "	25.00

The money always to accompany the names for which the paper is ordered.

The Post-Master, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Post-Master, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, *Weekly Tribune*, or *Weekly Times*, or any other paper or periodical in this city, not costing to exceed two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if enclosed and mailed in the presence of the Post-Master.

Communications for the paper should be addressed to the Editors; subscriptions, advertisements, and all matters relating to the business department, should be addressed to the Publishers,

ALLEN & CO.,

FINGER AND TOE IN TURNIPS.

THIS disease of the turnip crop has not, as yet, made sufficient progress in this country to attract general notice, though in many parts of Great Britain it has already begun to enlist a degree of attention second only to the potato rot. We have, however, heard of some failures of the turnip crop, which, from the imperfect description given, we are inclined to think have resulted from the reproduction in this country, of the disease familiarly known abroad, as the "Finger and Toe." Indeed, we shall not be surprised to find this disease already under considerable headway among us; and that the reason of its being unknown is, that turnips having been considered a kind of uncertain crop, the failures have not been traced to any particular cause, but have been classed under the general result of "a bad season," or "bad seed."

Be this as it may, it will not be uninteresting or unprofitable to devote a little space to an inquiry into the general phases of this disease, as brought out by the special investigations of the Agricultural Society of Scotland. We shall not attempt to give any thing more than the results obtained by the committee having this subject in charge. The partial report occupies some 22 pages of the quarterly journal of the above-named Society.

The committee commenced the investigations by sending out to a large number of turnip raisers in different parts of Scotland, a circular containing more than twenty questions, as to the variety of turnip most affected, the nature and treatment of the soil, rotation of crop previously, the weather, time of sowing, kind of manures, time of appearance of disease, &c.

Many of the answers to these questions were conflicting, as will be seen further on. A minute examination of the numerous specimens sent in to the committee, indicated three well-marked varieties of the disease.

In the first, the bulb is much deformed, having lost its naturally rounded form, and in place of the usual plain tap-root, it either branches out into a large number of small fibrous roots, or presents a mass of excrescences on the lower part, through or among which, bunches of fibres are seen to pass. In some cases, especially in the earlier stages of the disease, there is merely a thickening of the main tap-root, or a small excrescence on one side; in others there is either a large bunch of small roots, or a group of protuberances, so that the entire bulb is converted into an irregularly modulated mass, often

of the most grotesque and extraordinary form. It is not uncommon to see a fibre run a distance of six or eight inches, and then swell into an excrescence as large as a bean or filbert. These are broken off in pulling the turnip, and on this account are not observed, unless carefully looked for. These excrescences are similar in texture to the healthy bulb, though generally harder and more woody. In the later stages of the disease, these excrescences change to a pulpy mass of decomposing matter, and form a nest for the eggs of insects.

In the second form of the disease, the bulb retains its ordinary form, but on its sides are seen one or more spots, varying from one to four inches in diameter. They resemble warts, presenting a rough and irregular surface, though generally but little raised above the level of the skin. On cutting the turnip nothing remarkable is seen in the earlier stages of the disease, but later decomposition is found to have commenced, and that part under the diseased surface is found to be soft, discolored, and putrid.

The third form of the disease—which has only been observed in the swede variety—is characterised by a wart-like excrescence on the bulb, having a brownish appearance; and when cut into, it is found that the bulb for a considerable depth has become completely dry, consisting of a light spongy mass, of a brown color.

The first form of the disease is by far the most common, and corresponds with the description of that observed in this country. The second form is less frequently seen, and the third form is believed to be rare.

Dr. ANDERSON, chemist to the Highland Agricultural Society, and the chief acting member of the committee, instituted a large number of analyses, both of the healthy and diseased bulbs, grown in the same field, and of the different soils where the crop was most subject to, and most free from, the attacks of the disease. The result of these chemical examinations indicated nothing worthy of notice in the composition of the roots. The diseased bulbs contained less water than the healthy, owing to their harder and more woody texture. In most cases of comparison, however, the ash of the healthy bulbs contained a larger percentage of chloride of sodium (common salt.)

The chemical examination of the soils showed pretty conclusively, that their composition has no effect upon the development of the disease.

We may now allude to the answers given to the schedule of questions addressed to practical turnip raisers.

1st. *Variety of turnip affected.*—A dozen gentlemen were of opinion that all varieties were equally liable to the disease. A greater

number, however, state that a difference is observable, and that the white globe appears to be the most commonly and most severely affected. Next to this, the purple top yellow, green top globe, and hybrids, are most commonly affected. In general the swedes suffer less than others, though two gentlemen found this variety the worst. The committee, from all they can gather from various sources, conclude that the varieties which are the softest, and which cannot be kept long, are most liable to the disease. They think exceptions may be expected, which we are yet unable to account for; and that where the disease occurs with much virulence it may attack all varieties equally.

2d. *The nature of the soil, course of cropping for the last seven years, and rotation of crops previously.*—The general conclusion drawn from the numerous reports, is that the disease makes the greatest ravages in light soils. With two or three exceptions, clay soils were generally exempt. The mechanical state of the soils appeared to exert considerable influence. Though light soils are most subject to its ravages, yet on headlands, waggon paths, and other places where the ground was compressed, the turnips were most diseased. In one place where mud was thrown out along a ditch in cleaning, the whole crop was destroyed.

No connection could be traced between the disease and the previous rotation of crops upon the soil.

3d. *Date of sowing, and weather before and after.*—From the instances narrated, no conclusion can be drawn in regard to the influence of the weather at the time of sowing. A majority, however, suffered most from late sown crops, though this effect may have been modified by the particular season in which these observations were chiefly made.

4th. *Manures—kinds, quantities, state of, time and mode of application.*—Fertilizers of almost every kind, and in different states of preparation were tried, yet little satisfactory information is supplied. Well-rotted farm-yard manure produced less disease than the same kind of manure in a raw state. In many cases, rape-dust acted as an antidote, though this also failed in several instances. It appears on the whole, that the disease was worst where guano was the sole manure. Where guano was mixed, as it is always better it should be, with superphosphate of lime, the disease was not worse than with other manures.

5th. *Date of appearance of disease.*—Its first appearance was observed at various periods, from June to September, perhaps more frequently after the occurrence of dry weather.

6th. *Effect of repetition of turnips on same soil.*—The reports are so contradictory under

this head, that the only conclusion which can be drawn is, that frequent repetition of the crop exercises no particular influence. The disease was, in several instances, very severe on land where turnips had never been raised.

7th. Occurrence of insects on the plants.—On this point, the information is also very conflicting. But although the majority of the observers state positively that no insects were present, this does not outweigh the testimony of those, who were, perhaps, more careful observers, who found evidences of insects, and who are in the belief that the disease may be produced, like galls on the oak, by the presence of the larvæ of some insects. One gentleman, Mr. M'TURK, of Hastings Hall, presented a report on this subject, which is very interesting, and we quote a part of it in his own words:

On a minute examination of the disease, where fully developed, I invariably found evidence of insect life, and, when only in the incipient stage, it appeared as if the circular tissue had been ruptured in minute patches over the substance of the galls or tubercles—these patches extend in size till they run to each other, and are at first of a blackish color, but in the course of time acquire a brownish shade, which I regard as merely the progress of putrefaction. I believe that these blackish patches are very generally occasioned by the attacks of insects, when an insect, either from instinct or to satisfy its wants, in the first instance pierces the root. It then deposits an egg, scoops out another hole, and another egg is deposited. These holes are sometimes close to one another, or at short distances; and although the skin of the root has only been pierced in the first instance, and a lodging for the egg found in the substance of the root, by a law common to every species of life, the plant covers over the puncture by a deposit of fresh matter, a tubercle is formed, and, as the insect continues its operations along the contiguous portions of the root, or is joined by other insects in the like operations, a series of galls or tubercles are formed. The living energies of the plant are then still further impaired, putrefaction in some of the earlier-formed tubercles commences, and this most commonly at the time when the eggs deposited have arrived at the larvæ stage. The maggots or grubs thus produced, live on the putrid matter around them, and eat their way to the surface, forming an outlet by which they have communication with the soil and air, but still continue to feed on the decayed substance of the root, which at last assumes a honey-comb appearance from the consumption of the more putrid matter, and then becomes a fit receptacle for the chrysalides, when that stage of their existence arrives. But in cases where there was little putridity, I have found many instances in which a maggot has taken a different direction, and continued its course into the solid tuber till the time arrived for its transformation, or when it could proceed no further. It seems then to have surrendered itself, and the change into chrysalis taken place, the same as, under more favorable circumstances, for its entering upon insect life. The ravages of these maggots are not confined to the putrid matter of the finger and toe excrescence, but the unhealthy state of the plants renders the fibrous roots an easy prey to them and a great variety of the beetle tribe, and their larvæ, which infest the soil. Nor is the depredation of these tribes confined to the fibrous roots, they penetrate the interior in great numbers, and of many different kinds, as far as putrid matter is to be found, the turnip thus becoming a means by which its deadliest foes are nourished, increased, and perpetuated; and I believe it is from this cause that the disease is in general most prevalent in those farms (other things being alike) where turnips have been longest and most frequently cultivated.

Query? May not some clue to the potato rot be suggested in the above quotation?

We pass over the answers to the several other inquiries, which are so contradictory as to give little information, or are alluded to in the

General Conclusions.—We will here give in full, the general conclusions of the committee, which are as follows:

Such are the results of the inquiries made among some of the most skilful farmers in all parts of Scotland, results which, as it will be at once apparent, are of a very conflicting nature—much more so than could possibly have been anticipated. It appears, indeed, that not only do remarkable differences of opinion exist among different persons, but in some instances an individual reporter informs us that he had arrived at certain definite conclusions, of which the experience of later years had led him to doubt the accuracy. Many of these discrepancies are no doubt due to climatic differences, and might probably meet with a satisfactory explanation, if we possessed definite information regarding the meteorological phenomena of the districts in which they were observed; but others are of the most inexplicable character. It is very difficult to deduce, from among these conflicting statements, any conclusions which can be considered altogether beyond cavil; but we shall endeavor to state at least such as appear to us fair and legitimate inferences, from the consideration of all the facts, both theoretical and practical, which have been accumulated.

1st. It is unquestionable that the disease is not due to any chemical change in the composition of the soil. It is obvious, however, that its physical characters, though not the cause of the disease, influence in some way or other its development. Thus it is unequivocally made out that the disease occurs far more frequently, and far more severely, on light soils than on heavy, and that the stiffer clays seem to produce turnips in which it is rarely observed.

2d. The disease is not dependent on any chemical change having taken place in the plant itself, but the changes observed are a consequence of diseased action.

3d. That, as far as can be at present seen, the most probable explanation is that which attributes the disease to the attacks of insects. This view, and the mode in which the insect appears to make its attack, have been detailed at some length already, in the words of Mr. M'TURK, who has described the whole matter with the greatest clearness. It will not, of course, be supposed that we can assert with positive certainty that insects are the *invariable* cause of the disease, for many of the reporters state that they have never observed any. It must be observed, however, that this is negative evidence only; and in some cases, no doubt, the failure to observe insects may with justice be attributed to the observations not having been properly made. It is not to be expected that the effects are produced by insects infesting the leaves of the plant, but, as has been before observed, it must be due to their attacking the root, and depositing their eggs in punctures in its skin. Mr. M'TURK has fully explained all this, and Mr. Sanderson has stated that he has invariably found a small worm or grub, on cutting open the excrescences in their early stage. In fact, if insects are to be sought for, it ought to be by cutting open the fingers and toes, and carefully examining them in all directions in the earlier stages of their growth, because, in most instances, the caterpillar produced from the egg, which we believe to be deposited in the puncture, according to an established law of insect life, eats its way outwards to the external air. I am even inclined to believe that the putrefaction observed in the latter stage of the disease is due to the communication made between the air and the interior of the bulb, the juice of the turnip becoming partially extravasated, and decomposition being set up in consequence. The opinion that the disease is due to insect life, appears to me to derive confirmation from the fact that

land becomes, so to speak, *infected*; so that, when the disease has once made its appearance, its tendency is to extend, and it is only eradicated by some special treatment. Numerous remarkable instances have been communicated to me, in which the disease was manifestly produced by a sort of infection. Mr. Elliot states that he has often observed that, if diseased turnips be stored during winter on a stubble field intended for turnips next year, the disease invariably destroys the crop in those parts. Mr. Wilson, Freeland, mentions a case having occurred on Lord Blantyre's farm, in which diseased turnips were applied as *manure* to the wheat crop, and the disease afterwards made its appearance on the part of the field so manured. Mr. Fortune, of Muircambus, gives a similar statement as having been observed on two different occasions on his farm; and Mr. Finnie observed, on a field of his in which turnips had been partly removed and partly eaten off with sheep, that the former was comparatively free of disease the next time it was under turnip, and the latter portion severely affected. Numerous similar facts have been mentioned to me, so that there can be no doubt about the accuracy of the observation. Now, the most intelligible explanation of this fact is, that the insects, once introduced into the soil, remained there, and attacked the subsequent crop. We know that when insects pass into the chrysalis state, they frequently remain for years in that form; and thus it is easy to conceive that they may have lain dormant in these cases, and in passing into the perfect insect have deposited their eggs on the young plant. It would also explain the fact that, when the disease appears in a district, it remains permanently in it, unless some means of eradicating it are taken.

4th. It appears that the disease may in most instances, though not in all, be prevented by the liberal use of lime, which must be applied one or two years previous to the turnip.

5th. If this disease be really produced by the attacks of insects, it is worthy of inquiry whether lime may not produce its good effects by destroying them. If so, there must be other modes in which this could be effected equally well, and with a less expenditure. Several substances have been used for destroying insects, such as tar, tar oil, and the like. Salt has also been employed in some cases with effect, and one or two instances are mentioned in which it has proved of use to the turnip. These, and similar methods of treatment, are certainly deserving of more extended trial.

HOW TO USE GUANO.

We have remarked on this subject frequently, but as too much can scarcely be said on a topic of so much importance, we subjoin the following concise directions from the *Mark Lane Express*.

First.—Never mix it with any thing; all lime, compost, ashes, and similar ingredients, too often contain enough caustic alkali to drive off the ammoniacal parts, before the soil can surround and absorb them. A vast amount of mischief and loss often follows this sad mistake. If they could apply it alone, the soil can best adapt it for plants.

Second.—Mix as much as possible with the soil, not too deeply, but plow it in after sowing it broadcast, unless it be for beans, or drilled and ridged crops, when it may be sown on the surface before the ridges are made.

Third.—If applied as a top-dressing, always apply it, if possible, before rain, or when snow is on the ground; and if on arable land, harrow, hoe or scuffle, if possible, immediately after the operation.

Fourth.—The best mode to apply it is by water. A slight solution of it is by far the most powerful and speedy application.

Fifth.—If sowed with drilled grain, or indeed any seed whatever, it should never come in contact. It is not a bad plan to sow broadcast, after the corn-drill, and then harrow, as it

is kept in the nearest proximity to the seed, without coming in contact with it.

Lastly.—Be sure to get, if possible, the *genuine article*; cheap guano there is none.

The quantity of *genuine* guano, per acre, used, is from two to three hundred pounds. The latter quantity when the land is deficient and requires speedy renovation.

ON THE CULTURE OF LUCERNE.

BY A PRACTICAL FARMER.

[We are glad to meet with the following article, which we find in the *Mark Lane Express*. The Lucerne crop is one of great value in England, and we have little doubt that it will be found worthy of *general adoption in this country*. The article will well pay a careful perusal.]

"Lucerne is a deep-rooting perennial plant, sending up numerous small and tall clover-like shoots, with blue or violet spikes of flowers. It is a native of the south of Europe, and appears to be acclimatized in the warmer parts of England. Lucerne or medic is highly extolled by the Roman writers." "Lucerne is much grown in Persia and Lima, and is mown in both countries all the year round, it is also of unknown antiquity in Old Spain, Italy, and the south of France, and was introduced to England from the latter country, according to Miller, in 1657."

Columella speaks of it, as the choicest of all fodder, and lasting many years; that it may be cut from four to six times annually; that it enriches the land upon which it grows; that it fattens healthy cattle, and is a remedy for sick ones; and that the produce of one rood will keep a horse the whole year.

I cannot admit the full force of the latter remarks; but I know it to be a most valuable "artificial grass," and worthy of the attention of every cultivator; and it has, as a plant, become so hardy, that no great apprehensions need exist as to its successful cultivation on all suitable soils in this country. The soils best adapted to its growth are, I believe, a deep mild loam on a chalky subsoil; but all lands that are well drained and suited to the growth of wheat or turnips will do well for lucerne; they must, however, possess fertility and depth, and the richer the better.

The preparation of the land should be by deep plowings; it must be brought to perfect culture, and be cleansed from every weed, as these are very detrimental to the young plants. The pulverization should be complete; and when the soil is rendered as fine as possible, it should be supplied with a heavy dressing of rich well-fermented dung—this is to be immediately plowed in, the land rolled down, and all to be finished by the latter end of April or beginning of May.

Seeding.—The seed should at once be drilled in, at the rate of sixteen pounds per acre, at intervals of nine or ten inches. If sown broadcast, about eighteen pounds should be the seeding per acre. Drilling, however, is by far preferable, as offering much greater facilities for cleaning the crop, and other subsequent management.

It is not an uncommon practice to sow lucerne upon a corn crop. This I think very objectionable. It is in its early stages of very tender growth, and requires every attention and advantageous nursing that can be given to it as a crop; but when once it has secured a good hold upon the soil, it is one of the hardiest and most productive of fodder crops. The great desideratum is to procure a good plant in face of its numerous enemies—the fly, slug, beetle, grub, wireworm, and last, though not least, weeds—all are very destructive; and on that account I strongly urge the above course as most likely to secure a good and permanent plant.

Subsequent Management.—This will mainly consist of repeated hand-hoings, forkings, and

pickings, together with a periodical supply of rotten dung, to be well forked in. Harrowings are to be deprecated, though constantly practiced; it may be a cheap way of tearing up surface weeds; but it also greatly injures the lucerne plants, and of course renders the cuttings less productive. In the third or fourth year after drilling, the crop may be very greatly improved by hoeing up every alternate row; it will by this time have attained sufficient growth and strength of plant to fill up the intervals with its luxuriant herbage, and may then be more economically cleaned and better cultivated by the horse-hoe and ridge-harrow. The plant will also grow more vigorously, and yield more abundant fodder. As a top-dressing, gypsum stands first, at the rate of three to five cwt. per acre, applied when the herbage is growing freely. The saline mixtures come next, and most of the artificials used as manures are beneficial; but being a deeply tap-rooted plant, they are of little value as compared with good farm-yard dung put to the roots. Great care is required to keep the crop clean, as it cannot long exist amidst grassy weeds, neither can it bear depasturing any more than a carrot-bed; for if once the head or eye is eaten, the root is almost certain to die. If, however, the crop is well managed, and duly cleaned and manured, it will continue to yield large supplies of very nutritive fodder for ten or twelve years in succession, and the cuttings after the first year may average from three to five tons of green fodder per acre. It will frequently be ready for the first cutting by the latter end of April; and its growth is sometimes so rapid as to attain one-half inch in height per day, for thirty or forty days together. This, I would observe, is only attained in row culture. On the broadcast system it does not grow with such rapidity; of course its cuttings are less frequent and also less abundant, and its earlier destruction more certain.

I do not know of any domestic animal that does not manifest a decided partiality for fresh cut lucerne. They may be seen weeding it out from other grasses, and eating it with the greatest relish. Horses, cattle, sheep, pigs—all alike do this. For milk cows it is superior to clover in every particular, causing an increase in the quantity and quality of both milk and butter. In this respect it cannot be too highly recommended to cottagers "who keep their cow," a rood of land being sufficient to grow food for one cow; and to all occupiers it must form a very valuable addition to their ordinary supplies of green food; to those in particular who adopt the soiling system it is almost indispensable, partly on account of its amazing produce, and partly as a wholesome and highly-nutritious change of food. Much has been written relative to its transplantation to produce a crop; it will undoubtedly produce a crop in this way; but it is undesirable, except to fill up old gaps and the like, as the general crop begins to decay; this, however, is of very doubtful efficacy. It may be, and frequently is, sown with an ordinary spring crop, as barley, oats, early peas, flax, buckwheat, &c.; but I have no hesitation in saying, that it is the best, and eventually the most profitable course to prepare the land, especially for the lucerne crop, and put it in alone. I have named the month of April as the best time for sowing this crop, but it may be deferred so late as August; however, the earlier it is sown in the intermediate months the better; that sown in April would yield one cutting in September, and yet be strong enough in plant to abide the winter. It is seldom grown for a seed crop in this country; this is generally imported, and chiefly from France. I need not observe that most plants die after producing their seed; and although this is not the case to its full extent with lucerne, still it is irretrievably injured by taking the seed crop; hence it should not be taken until the last year it has to stand; it should be once cut, and then allowed to produce its seed, which, when ripe, may be cut and managed in the same way as the clover crop,

which mode has been described in my previous papers. It is also seldom cut for a hay crop, for which it is in fact not well adapted, its chief value being for soiling as a green herbage crop. It is sometimes greatly injured by mildew, for which it appears to me there is no preventive or remedy. Caterpillars will attack it in great numbers—in such case, it should be all cut at once, and the land hoed and well raked, or, in such an eventuality, a light harrowing might be allowed, as it is important to destroy these marauders instantly. Stock when feeding upon it are not so liable to colic, or to become hoven, as when feeding upon tares or clover; it is, nevertheless, desirable to cut it a few hours before required for use.

For the American Agriculturist.

WAYNE COUNTY, N. Y.

CHARACTER OF SOILS, FARMING PRODUCTS, &c.

PERHAPS a few remarks on the climate, soil, and productions of Wayne County, N. Y., may meet your approbation. It can be safely classed among the six best counties of the State, and is improving perhaps as rapidly as any other. The southern part has been settled much longer than the northern portions bordering on Lake Ontario. For fine, pleasant villages, and productive and pleasant farming country, the southern part cannot be excelled in the State. The facilities of canal and railroad give them the advantage over the northern part, though there is now a railroad in progress from the Central R. R. at Newark to Sodus Point, a good harbor on the Lake, which will make an outlet for that part of the county. The northern part is comparatively new.

The probable reasons for its not being sooner settled, were the high prices at which the land was held by the Holland Company who first purchased it, and to its being unhealthy in some localities. But if you now look in upon its many good farmers, you will be convinced that the state of things is progressive, and I venture to say we have as good a farming district as can be found. The climate is temperate, as the lake modifies the cold and heat. Last fall cattle fed out until the 19th of Dec., and got a good living. Tomato vines were not destroyed until near the 1st of Nov. The thermometer has ranged the past winter from 2 deg. below to 50 above zero, and we have had but little snow, not enough to make good sleighing.

The soil of this county is varied. In the southern part it is a clayey loam interspersed with gravel. In the eastern part there is considerable low land, portions of which are covered with black ash and tamarack; the soil being a black loam, or muck. In fact these black ash swales are found in nearly all parts of the county, affording a fine supply of good fencing. In the northern part, there are two kinds of soil with a distinct boundary between them. In the town of Sodus is the commencement of the Lake Ridge Road, which extends west to the Niagara River. This road runs along on the ridge which is said once to have been the shore of Lake Ontario, which is quite probable. On the south side of this ridge, the surface is rolling or interspersed with smaller ridges, and the soil is a gravel. This is very productive. Wheat is grown successfully. It is true the weevil has injured this crop to some extent, but not as much as in parts more remote from the lake. Corn, barley, oats, buckwheat, &c., are raised in great quantities. It is not as natural for grass as the loamy land, but good crops of clover are grown. North of this ridge the soil is a sandy loam, and in many places very thickly covered with cobble stones, many of them quite large. It is low and level, and considered very good for wheat.

As a fruit growing region, Wayne Co. cannot be excelled. Apples, peaches, pears, plums, cherries, and Quinces are raised in great abundance, and form no small item in its exports. There is no county in the State, (I believe, from statistics,) that sends out as much fruit, both green and dried, as Wayne.

The rearing of cattle has not been so much attended to as in less grain-growing districts; but there begins to be an improvement in that respect, and several fine herds of Durhams and Devons are to be seen. There are some sheep, mostly of the Bakerwell or English breed, kept more for mutton than their wool, which is very coarse. Land brings from \$30 to \$100 per acre, and is perhaps as cheap for the quality, as in any place in the State. There is a flourishing County Agricultural Society here which is doing a great deal to benefit farmers.

S. A. COLLINS.

Sodus, Wayne Co., N. Y.

ON THE MANAGEMENT OF MANURE.

1st. The plan now general over the better-farmed counties of England and Scotland, of plowing in fresh manure on the autumn stubble, in preparation for the succeeding green crop. 2d. The Myer Mill plan, which is also, if not general, at any rate now practised by one or more in every district, of liquefying the whole exuviae for distribution by steam power and iron pipage over the land. 3d. The plan explained by Lord Kinnaird in the last number of the "Agricultural Society's Journal," supported by most conclusive evidence of its being a profitable one, of having the manure made in covered court-yards. I have used the word "made" advisedly, because his lordship's experience shows that it can be at once carted to the field, and spread in drills even for potatoes.

I can testify to a similar result attained in my own practice. The droppings and solid litter of stall fed cattle, and the same from the work-house stable, are daily thrown into a walled and covered pit, care being taken that they are intermixed. A dozen feeding pigs are kept in the pit; any loose litter there may be found lying about, together with road scrapings, and odds and ends of animal and vegetable refuse, are thrown in; the pigs mix and incorporate the whole well together. From time to time liquid from the manure tank is pumped in; and thus we have generally a deposit of a considerable quantity of well-made manure at hand, to supplement the dung-heaps when they are exhausted. These (the dung-heaps) are managed on a system which is simple and efficacious, but which I have not seen described in any agricultural publication, I must premise that not having attained to that plethora of muck and fertility when the spring and summer manure can be reserved, to be plowed into the stubble for the succeeding green crop, I find that my summer and autumn collection is required for the wheat brake, which I am fond of having large. My winter and spring collections are drawn upon for potatoes and beans, while my turnip crop is raised almost entirely by portable manures. Thus, while there is no reserve on which interest is lost, there is a necessity for preparing the box-made manure for speedy use. This I effect by carting out the manure as the boxes become full, throwing it out of the carts into a heap of five feet in height by twelve feet broad. As we advance in this building, we follow with a cover to the top and sides of clayey mold. This cover is at first about six inches thick. The still open side, to which we are adding, admits a small degree of atmospheric action which induces a gentle heat. When this has gone on for three or four days, we add three to six inches more clay or soil, over which we pour dilute urine. This keeps the fermentation going on in the heap, the gases from which have to permeate the clay ere they can reach the atmosphere, and the now well-known absorption of ammonia by aluminous earth prevents waste. Indeed, with manure taken from covered boxes, there will not be any escape of vapor from the clay covering till the dilute urine is plentifully applied; even with manure made in courts, exposed to rain, there will be an escape of nothing but watery vapor, a loss which is a gain, as there is less weight afterwards to cart on the ground.

In ten days after the heap has been made, it

will, if it has been properly attended to as above, be fit for using in bean or potato drills, being soft and unctious; it is cooked in its own steam. Should it not be required for a month or longer, all that is necessary is to give it a coat of six inches more clay or mold, and it stands ready to be cut up when wanted. I find this system to work exceedingly well. I am satisfied that from seventy loads of manure, carted out and covered with thirty loads of clay, I have a larger store of fertilizing elements than I should have from one hundred loads of similar manure carted out and trenched up in the old mode to ferment. In this estimate I reckon only upon the elements over which I had a *quasi* control in the manure, little or none of which I lose; but I am inclined to believe that together with this great advantage I obtain another of less magnitude, in this, that I have set agoing a process by which I obtain an unbought store of nitric acid. This process is somewhat obscurely adverted to in Mr. Nesbit's letter, appended to Mr. Pusey's paper on "the Nitrates" in the last number of the Royal Agricultural Society's Journal; it was thus elucidated, ten years ago, by a writer then almost a pioneer, still holding a foremost rank in agricultural chemistry. "The quantity of nitric acid which is formed, (in the artificial nitre beds of France) is much greater than could be produced by the oxidation of the whole of the nitrogen contained in the organic matter present in the mixture. Organic matters are in our climates necessary to cause the formation of nitric acid to commence, but after it has begun it will proceed in the same heap for an indefinite period, and at the expense apparently of the nitrogen of the air only."

(Johnston's Lecture on Agricultural Chemistry, pp. 242, 243.)

These last words afford the clue to the mode in which a plant, alike gluttonous and wasteful of nitrogen, (it uses much and wastes more, see Rothamsted Experiences,) as the wheat, has been made to flourish without the application of manure, Lois-Weeden system. The three feet interval, uncropped and much cultivated, forms, so to speak, a trap, in which the ammonia and nitric acid, ever present in the air, are caught, and held at the service of the growing plant.—*S., in Gardeners' Chronicle.*

TO FARMERS.

NEAT be your farms; 'tis long confessed
The neatest farmer is the best.
Each bog and marsh industrious drain;
Nor let vile barks deform the plain;
Nor bushes on your headland grow,
For briars a sloven's culture show.
Neat be your barns, your houses neat.
Your doors be clean, your court-yards sweet;
No moss the sheltering roof enshroud,
Nor wooden panes the window cloud:
No filthy kennels foully flow,
Nor weeds with rankling poison grow:
But shades expand and fruit trees bloom
And flowering shrubs exhale perfume.
With pales your garden circle round;
Defend, enrich, and clean the ground;
Prize high the pleasing, useful rood,
And fill with vegetable good.

CLAIMS OF AGRICULTURAL PATENTS

FOR THE WEEK ENDING APRIL 16, 1854.

SEED PLANTERS.—Elbridge Marshall, of Clinton, N. J.: I do not claim the rotating hoppers with perforated bottoms; neither do I claim any peculiarity in the furrow and covering shares, nor the movable frame to which they are attached; nor do I claim the cams irrespective of their peculiar construction.

But I claim, first, the cams, C, E, having two rows or sets of inclined planes upon their faces, said inclined planes being placed oppositely on concentric circles, for the purpose of creating

an equal pressure upon the cam E, with suitable gearing, as shown, whereby its position upon the shaft may be changed, and the seed dropped at a greater or less distance apart whenever the crank is operated or turned by the hand, as described.

Second, I claim the bar performing, in combination with the circular plates underneath the hopper, the office of a valve, and simultaneously rotating said hoppers by its vibrating motion; the above parts being arranged and operating as described.

SEED PLANTERS.—Thomas Carter, of Laurens District, S. C.: The cylinder or seed wheel with the frame attached to it for the horse to pull it by, and the covering scrapers to cover the seed have been patented heretofore.

What I claim, therefore, is the seed discharging apparatus in the periphery of the seed wheel, the tube or apparatus, the escapement wires, and the protecting spring valves, as described.

RAT TRAPS.—Jose Toll, of Locust Grove, Ohio: I claim the combination, as described, of reciprocating and self-locking partitions and floor, in connection, as described, with the weighty crank, which, on the liberation of the catch alternately opens and closes the entrance of the chambers and of the cell.

RAT TRAPS.—Hiram Stafford, of Mount Pulaski, Ill.: I claim the combination of the titling board with the swinging forks and their apparatus, for the purpose and in the manner set forth.

BRICK MACHINES.—T. E. Seay, of Columbia, Va.: I claim the vertically moving knives arranged as described, in combination with the levers and slides, whereby the molded bricks are separated from the mass of clay, at the same time that the molds are raised from their recess, for conveying away and discharging the bricks, as set forth.

I also claim the employment of the gratings, as described, between the mill and molds, for screening the clay from stones and other hard substances, when this is combined with the exterior chamber, into which the stones and other substances are forced by the action of the clay, as set forth.

DRESSING FLAX AND HEMP.—L. S. Chichester, of Brooklyn, N. Y.: I claim the combination of the series of twisted or spiral and conical-shaped blades on the two rotating stocks, as specified, which, by reason of the twist and conical shape, perform a beating action on the fibres at one end, and gradually change until they perform a scrutching action at the other end, as set forth.

I also claim, in combination with the rotating twisted and conical-shaped blades, the casting which surrounds them, with the discharge-pipe at one end, to confine and direct the current of air, which is induced by the rotation of the twisted blades towards the discharge-spout, for the purpose specified.

MACHINES FOR CLEANING COTTON.—Charles Leavitt, of Buiney, Ill., (assignor to S. R. Cockrill,) of Nashville, Tenn.: I claim my method of arranging the several parts involved in extracting the motes, dust, and other impurities from cotton, previous to and preparatory for ginning the same as described, that is combing a wire screen concave with a revolving wire screen cylinder, or their equivalents, and a wind-wheel or fan, revolving within the cylinder, both cylinder and concave being armed with teeth set in ribs, so distant apart with regard to the teeth, as to permit the cotton seed to pass, while the fibre alone is loosened, the revolving screen running slowly in comparison with the wind-wheel, which is driven at great velocity, thereby adapting the machine to the particular purpose specified, viz., freeing cotton from motes, dust and other impurities while attached to the seed, previous to ginning the same.—*Scientific American.*

THE face of nature is the footprint of God.

Horticultural Department.

THE NEW-YORK HORTICULTURAL SOCIETY was interrupted in its regular meeting, on Monday evening, by the severity of the storm, and consequently was adjourned for one week. Some unique drawings of Suburban Gardens were exhibited, which are well worth an examination by the next meeting.

A very fine specimen of the Orchid family, with the billet of wood to which it had attached itself, was exhibited by Mr. SCOTT. The long spike of delicate and beautiful flowers elicited universal admiration.

We are informed that the tomatoes and strawberries, referred to in our last report, were not from WM. CHARLTON'S green-house, as reported.

BROOKLYN HORTICULTURAL SOCIETY.

THIS spirited Society held its regular meeting on Thursday evening, the 21st inst., at their rooms in the Athenaeum, corner of Atlantic and Clinton streets, which was very well attended.

Some very handsome Pot Roses, Acacias, Fuschias, Geraneums, Seedling Cinerarias, and Seedling Pansies were exhibited by the Messrs. POYNTER, CANNER, WEIR, and others, and several vigorous plants of different varieties of the strawberry, with large ripe fruit on the stems, were exhibited in a pot from the green-house of JOHN B. KITCHEN.

JOHN W. DEGRAUW, Esq., their President, occupied the chair, and the meeting was chiefly occupied in perfecting their arrangements for the spring exhibition, which is to be held at the Brooklyn Athenaeum, on the 10th, 11th, and 12th of May.

Very liberal premium lists, amounting in all to about *four hundred dollars*, are already out.

This Society was organized but two months since, yet the meetings have already called out large audiences of the ladies and gentlemen of Brooklyn.

We think the Society gives promise of, and we heartily wish it, a large success.

PEACHES AND CREAM, STRAWBERRIES, GREEN PEAS, AND TOMATOES.

ALL of the above are now in perfection in the New-York market. We have just been regaling ourselves with a lunch of them, fresh and excellent. *Peaches*, the genuine Morris Whites, just ripe, and cut up to order. *Strawberries*, large and luscious, smothered in cream, or by the peck, or larger quantities, as desire and purse may demand. Green Peas and Tomatoes in order to prepare for the table.

If any of our northern readers wish to know how this is all accomplished, we will add, the Peaches, Green Peas and Tomatoes, came from Bermuda, and the Strawberries, ripe, (Hovey's,) in large quantities, from Georgia, and we suspect from our friend PEABODY'S eight-acre field of them near Columbus.

From present appearances, we think the season of these luxuries will be satisfactorily long with the New-Yorkers. If any are curious to know the cost, we answer, a nice dish of Peaches and Cream, (not milk,) &c., eighteen pence; and one shilling for the same of Strawberries.

THE DOUGLAS FIR.--(*Abies Douglassi*.)

On receiving *Turner's London Florist* for February, we so much admired the noble conifer therein represented, that we placed it in the hands of the artist to transfer it to the *Agriculturist*, and we here present it for the gratification of our readers.

It is called *Abies Douglassi*, or the Douglas Fir, so named in honor of Mr. D. DOUGLAS, who first introduced it into Great Britain in the year 1826, from the North-west coast of America.

This specimen is said to be the finest in England, and was raised from seed in the spring of 1828, transplanted into ordinary soil, and has flourished since with only an occasional top-dressing of decayed vegetable mold. It is now 25 years old, 70 feet high, diameter of branches 58 feet. In its native soil it attains the great height of 180 feet, with a trunk 12 to 15 feet in diameter, and its branches spread out near the ground to a diameter of 140 feet. It is perfectly hardy, and this has grown so rapidly, as to average two and a half feet annually. The timber is of yellow color, firm and heavy; the tree, as will be seen from the engraving, "assumes an upright conical form, with numerous horizontal branches, from the ground upwards, thickly set with foliage; the leaves are of a pleasing green color, and remain a long time on the branch, and thus form a dense mass of foliage,

which adds much to its value as an ornamental tree; and when the young shoots (which are at first of a bright silvery green) protrude in the spring, the contrast between them and the older shoots from which they proceed, shed a varied mass of light and shade at once beautiful and striking."

Most of our best nurserymen's catalogues advertise this beautiful evergreen, and we can, without hesitation, recommend its more general adoption in this country. We wonder that trees of this, and other similar classes, are not more common among us. Every farmer, or other householder, possessing a half acre of land, ought at least to set out a group or two, or one or two belts of our beautiful evergreens, which grow so freely and become so very ornamental, furnishing alike, a cool refreshing shade from the summer solstice, and a noble protection from the cold winds and driving storms of mid winter.

Almost every one can get the *Hemlock*, and we have high authority for pronouncing it "the finest evergreen tree indigenous to North America for ornamental purposes."

We should not have been prepared to endorse the proposition which places the common *Hemlock* in so high a position, had we not visited, 3 years ago, the well-cultivated grounds of Mr.

MATTHEW MACKIE, two miles north of Clyde, N. Y., where we saw specimens of cultivated Hemlock, that would almost rival in beauty—and nearly half the size—the noble fir presented by the cut. Mr. MACKIE had gathered them from the forests surrounding his home, and by good cultivation they excelled in beauty almost any evergreen we had seen in the country. Many years ago, Mr. DOWNING says, "We place the Hemlock (*Abies Canadensis*) first, as we consider it, beyond all question, the most graceful and beautiful evergreen tree commonly grown in this country. Few of our readers have the least idea of its beauty when grown alone, in a smooth lawn, its branches extending freely on all sides, and sweeping the ground, its loose spray and full feathery foliage floating freely in the air, and its proportions full of the finest symmetry and harmony."

The *Balsam Fir*, or as it is often called, the *Balm of Gilead Fir*, is more commonly used in this country than any other, and is very handsome when young; but when it exceeds twenty feet in height, it grows coarse and stiff, and is therefore more especially fitted for small grounds.

The *Norway Spruce* (*Abies Excelsa*) is one of the noblest and most justly celebrated evergreens in our country. The finest specimens which we have ever seen, may be found in the old Linnean Garden at Flushing, L. I. It is very hardy, and grows upon almost all soils, in the shade of trees, or in the most exposed situations. There is a beautiful full-grown tree at Studley, England, 132 feet in height, diameter of the trunk $6\frac{1}{2}$ feet, with diameter of the head 39 feet.

Another evergreen we would recommend, is the *White Pine*. It is of fine form, rapid growth, and the foliage is of a soft, perpetual green, and well adapted for ornamental grounds.

The *Deodora Cedar*, although not so hardy as the foregoing, yet with a little care, easily becomes acclimated still farther north than New-York city. They grow as rapidly as the Douglas Fir—2½ feet on an average each year—and attract by their silvery foliage and graceful drooping habit, and yet Mr. DOWNING said of the Hemlock, "In fact it is as handsome as the Deodora, and is very much like it. The latter droops more and is *silvery* in its foliage, instead of *bronzey*—but they are much alike otherwise, and are the best possible companions in the pleasure grounds."

We have purposely placed two or three of our most common native evergreens along side of some of the most popular foreign sorts, in order that our readers may see that no one particular variety is indispensable; neither is it so important which of one or more kinds are selected, as it is to choose the perfect form, and give good cultivation after they are taken. Nothing better repays intelligent care, and a very little knowledge of their habits is soon attained. For instance, in transplanting, they will generally thrive in proportion to the amount of soil left on their roots in the transition state from the nursery to the lawn. LONDON says, "By the exposure of their roots, the extremities of their fibers, the *spongioles* become closed; and unlike deciduous trees, when once closed, they never again expand, or perform their proper functions." A short exposure of the roots to the rays of the sun, or even to the atmos-

phere, is often fatal. Not only the growth of the evergreen, but its life, is dependent on the strictness with which the above rules are observed. There is no difficulty in transplanting evergreens in May, if the earth is carefully taken with the roots.

Did our limits permit, we should like to refer to "the fringed and sombre *Black Spruce*, the sun-shiny *Yellow Spruce*, (which, when well cultivated and flourishing, can scarcely be distinguished from its more fashionable cousin of *Norway*,) the stately spires of Fir, the grand and noble *Rhotan Pine*, the curious and beautiful *Holly*, the rich, green, strange, coral-like *Arancarias*, the solemn, grand "*Cedar of Libanus*," not to more than mention the California Giant, *Wellingtonia Gigantea*, a species of *Taxodium*, which grows to the enormous height of 300 feet, with a circumference of 32 feet three feet above the ground, and some 20 feet in diameter; and in the California forest some 80 to 90 of these trees are to be found within the circuit of a mile; we will not, we say, stop to speak of these now. We hope our readers will take as a model the specimen we here present, and from some of those first named, succeed in training a dozen trees on their own grounds, that shall verify all that we have here uttered.

For the American Agriculturist.

STRAWBERRY INQUIRY.

I AM wishing to raise a good plot of strawberries for family use, but the bad success of my neighbor has discouraged me. He has a very fine garden soil, and he followed Mr. DOWNING's directions in his *Fruits and Fruit Trees* fully, by "well enriching with strong manure and thorough trenching." He then obtained the best kinds of plants, and set them out with great care, and watered and watched them. They grew most luxuriantly, blossomed well, both staminate and pistillate, but where he should have gathered bushels of fruits, alas! he could not get a pint. It was a total failure. Can you tell me the reason, and how to avoid the error?

WESTERN NEW-YORK.

We have no doubt the reason the luxuriant vines did not bear fruit, was, the ground was too highly enriched. Probably the fine garden soil itself was too rich for strawberries, before the strong manure was added. Sand would have been a better application than any thing else, if in clay soil, as your region indicates. There is no error so common in strawberry cultivation—if we except neglect—as over-feeding. In a variety of ways, it acts injuriously in our climate. The strawberry is not so gross a feeder as corn or pumpkins, or even the raspberry, and it is so sensitive, that it will not produce freely when highly stimulated. We sometimes think it among the most sensitive of fruit plants. If not in just the right condition, it is a shy bearer, but when in good health, it will astonish all beholders with its abundant crops. Then prepare the ground well, by trenching if you please; at any rate, spade deep and pulverize the soil thoroughly. If a rich garden soil, reduce with a little sand, and add one peck of unleached ashes per square rod. If only a common mellow garden soil, neither add to it nor take from it, except the same quantity of ashes. If rather poor soil, add the ashes, four quarts lime, and a moderate coating of well-rotted woods' mold, or decayed leaves. Mulch well with tan bark, if convenient, or if not, with clean straw, or young

grass, and keep the young plants protected from drought by watering when needed, and there need be no more uncertainty in the strawberry than in the corn crop.

RUSSET APPLES.

OUR Pomological authorities do not exactly agree in their names and synonyms of these fruits; and the popular terms are, oftentimes, quite out of the way with either of the book authorities. For instance, DOWNING has the AMERICAN GOLDEN RUSSET—synonyms, GOLDEN RUSSET, SHEEP NOSE, BULLOCK'S PIPPIN. Following this description is that of the ENGLISH GOLDEN RUSSET, an inferior sort. Then, again, is the PUTNAM RUSSET, which, as was afterwards ascertained, is identical with the ROXBURY, or BOSTON RUSSET; but transferred to Ohio, from New-England, by the late General RUFUS PUTNAM, is locally called after him. DOWNING also describes the BOSTON, or ROXBURY RUSSET, correctly. The ENGLISH RUSSET he also describes without a synonym. THOMAS and BARRY, in their books, have added the name POUGHKEEPSIE as a synonym to this, at the suggestion, probably, of the fruit conventions. This is the beautiful, rich, and fair-looking apple generally so abundant in our New-York markets during the spring and early summer months, as the GOLDEN RUSSET, so called by the dealers. There is also a large Yellow Russet, described by BARRY, cultivated extensively in Western New-York, of the size of the Roxbury, which goes by the local name of the GOLDEN RUSSET, different from the Roxbury, in not being so long a keeper. Again, there is the POMME GRISE, (Gray Apple)—a Canadian fruit—very rich, a long keeper, but quite small. This is not much, if at all cultivated with us, but is abundant in the colder regions of New-York and the Canadas.

STORING APPLES IN DRY SAWDUST.

I HAVE a dark closet in my house, or rather I live in a row with windows back and front. The house is four story high, and the length from front to back is so great, that we have three rooms on a floor, the center one dark. On the third story the floors are plaster, and I find the temperature so even that I use it for a wine store in preference to the cellar, and have it fitted with bins. In this room I put some hampers of apples (like pearmain.) I wanted one of the hampers, and turned the apples on one of the bins, amongst the dry sawdust, (pine sawdust.) A fortnight ago we looked at them, having used up the others gathered at the same time and from the same tree, all of which were much wrinkled, but on taking those off and from amongst the sawdust, I found them in a most beautiful condition; those covered with sawdust were as plump and fresh as when gathered, while those partially buried were only so to the extent covered with the sawdust, the upper portions being wrinkled. I am so pleased with the discovery that I shall pack them in bins next year, for I have no doubt they will keep in this way till next Christmas.—*Correspondent Agr Advertiser*.

AMERICAN POMOLOGICAL SOCIETY.

THE Fifth Session of this National Association will be held at Horticultural Hall, in the city of Boston, Massachusetts, commencing on Wednesday, the thirteenth day of September next, at ten o'clock, A. M.

It is intended to make this assemblage one of the most interesting that has ever been held in

this country, on the subject of Pomology. All Horticultural, Agricultural, and other kindred associations, of North America, are therefore requested to send such number of delegates to this Convention, as they may deem expedient.

Pomologists, nurserymen, and all others interested in the cultivation of good fruit, are also invited to attend the coming session.

Among the objects of this Society, are the following:

To ascertain, from practical experience, the relative value of varieties in different parts of our widely-extended country. To hear the reports of the various State Fruit Committees, and from a comparison of results, to learn what fruits are adapted to general cultivation; what varieties are suitable for particular localities; what new varieties give promise of being worthy of dissemination; and especially, what varieties are generally inferior or worthless, in all parts of the Union.

In order to facilitate these objects, and to collect and diffuse a knowledge of researches and discoveries in the science of Pomology, members and delegates are requested to contribute specimens of the fruits of their respective districts; also papers descriptive of their art of cultivation; of diseases and insects injurious to vegetation; of remedies for the same, and whatever may add to the interest and utility of the Association.

The Massachusetts Horticultural Society has generously offered to provide accommodations for the Society, and also to publish its proceedings free of expense.

All packages of fruit intended for exhibition, may therefore be addressed as follows: "For the American Pomological Society, Horticultural Hall, School street, Boston, Massachusetts," where a committee will be in attendance to take charge of the same.

All societies to be represented, will please forward certificates of their several delegations, to the President of the American Pomological Society, at Boston.

MARSHALL P. WILDER, *President.*

H. W. S. CLEVELAND, *Secretary.*

Boston, Mass., April 1, 1854.

CINCINNATI HORTICULTURAL SOCIETY.

We find in the proceedings of this Society, as reported in the *Commercial*, that at the meeting held on the 15th inst., the following action was had on the Strawberry question:

The Secretary, at the request of the Society, reported a written statement of how he found the Strawberry-question in Philadelphia; after some animated discussion, it was moved to accept and file the report, and the Finality was ordered to appear in the minutes of the day.

FINALITY ON THE STRAWBERRY.

Wild or cultivated, the Strawberry presents in its varieties, four distinct forms or characters of inflorescence.

First. Those called *Pistillate*, from the fact that the stamens are abortive, are rarely to be found without a dissection of the flower. These require extrinsic impregnation.

Second. Those called *Staminate*, which are perfectly destitute of even the rudiments of pistils, and are necessarily fruitless.

Third. Those called *Hermaphrodite*, or perfect, having both sets of organs, stamens, and pistils, apparently well developed. These are not generally good and certain bearers, as we should expect them to be. With few exceptions they bear poorly, owing to some unobserved defect, probably in the pistiles. One-tenth of their flowers generally produce perfect and often very large berries.

Fourth. A rare class—a sort of *sub-division* of the preceding, has not only hermaphrodite flowers, but also some on the same truss that are of the pistillate character; and sometimes, in the same plant, a truss will be seen, on which all the flowers are pistillate.

Now these four divisions are *natural and real*;

they are also founded upon permanent characters, so far as we have been able to discover, after a most thorough investigation, extending through a long series of years, during which millions of strawberry blossoms have been examined with the severest scrutiny. Other forms may exist, and it is not claimed to be impossible that we may yet find a seedling which shall have the general character of a *pistillate*, that may show an occasional perfect or *hermaphrodite* flower, as a peculiarity of that individual, but we have never yet observed such a variety; and further, we believe, that whatever impress, as to peculiarities of foliage, pubescence, habit, inflorescence, or fruit, each distinct seedling may receive with its origin, it will be retained in its increase by runners, so long as the variety remains extant. Seedlings may vary from the parent, but off-shoots will not be materially different, except by accidental malformation or by development of unimportant organs. On motion, adjourned.

JOHN A. WARDER, *Secretary.*

AMERICA AS A FIELD FOR GARDENERS.

The following communication gives us an Englishman's view of the prospects of gardeners who emigrate to this country. This article was called out by a former one, which took a different view of the matter. We were conversing recently with a gardener from England, who has been in this country for a few years past, and whose observation corresponded with the views of this article. He said the great attraction in this country for gardeners from Europe, was the prospect of becoming themselves owners of a plot of ground to cultivate and dwell upon; a hope, few or none could cherish elsewhere, especially in Great Britain. We give the article as we find it in the *Gardeners' Chronicle*, and leave further comment upon it to the numerous intelligent gardeners, who have adopted this country as a field for exercising their profession.

Since this subject began to be agitated in your columns, I have learned that two or three young men in this neighborhood have resolved to cross the Atlantic in the course of a few weeks. It is likely enough that some elsewhere have determined on going to America, and the probability is, that many are halting between two opinions. I have sought information on the subject from parties in this country and others in America, as in my opinion it is a very important matter, for there are hundreds and thousands of gardeners in this country who must, in the nature of things, meet with disappointment here, have their hopes blasted, and spend their days on earth in penury and toil. The market is over-stocked. A gentleman who lately advertised for a person to manage his garden and ground, informed a correspondent of mine, that he was "for many days literally overwhelmed with applications." A friend and brother gardener of mine, holding a first-rate situation in Scotland, and much respected for his moral worth and professional attainments, informs me that most of the young gardeners who left this place for America had considerable experience—some of course better qualified than others; but the best places have not uniformly fallen into the hands of the best men, which not unfrequently happens in this country, as well as in America. In the Northern States, the average rate of wages may be about £70 or £80 a year, with board in some cases, in others, house fuel, and perquisites. In the Southern States, the wages are much higher, but in summer the climate is unhealthy there. In general, however, much money has been realized by those only, who have embarked in business as nurserymen, florists, or market gardeners. One man who left me in 1839, was

landed at New-York with only 1s. in his pocket; was employed there, and soon got a situation in the south, where he saved money enough to enable him to start or open a seed and general store in Charlestown. When he visited this country some five or six years ago, he told me that he could then retire from business with £700 a year to live on. My friend, Mr. —, florist, New-York, (one of the first who left this for America,) is now carrying on a profitable trade there. His heart, however, appears to be in Scotland, for, in a letter I had very recently from him he says that he has a great desire to spend the evening of his days in this country, and that he could afford to buy a piece of ground large enough to build a house upon, make a garden, keep a cow, and have at least £150 a year to live on. He mentions, however, that young people only should go to America, as those advanced in life rarely like it, while young folks are likely to become acclimatized, and, as I suppose, "yankeeized." I could make other extracts of an encouraging nature from this letter from Scotland; but I hasten to notice the cases of two of my wife's brothers, who were plowmen or farm-servants in Holderness, in Yorkshire, before they went to America. Of course they knew nothing more of gardening than other farm-men, but they both got situations as gardeners on their arrival in America. John, the eldest, crossed the Atlantic 12 or 14 years ago. He kept his first situation 2 or 3 years, and then he left it for a better at Enfield, Hartford county, where he had a great number of men under him. As soon as he could count over 1000 dollars of his own, he left his situation and went to the town of Urbana, in the State of Ohio; there he commenced the nursery business, and is succeeding well. His younger brother, David, went to America in 1852, and engaged himself as a gardener to a gentleman at Urbana for 7 dollars a week; but whether he had board or not, I cannot say. Unfortunately for David, his sweetheart left England the same year, and went to the State of Illinois. Well, at the termination of his twelve months' engagement, he gave up his situation, in order to go to Illinois; but he found considerable difficulty in getting away, as his employer was most anxious for him to remain. On the 14th of last month he wrote to us from Paris, Edgar county, where he is now working on a farm. His wages are 15 dollars a month, with board and washing, "But," he adds "I think I shall not work at farming after this winter, unless it be for myself, as I can get more wages at gardening, which is much prettier work. Take one thing with another I like America much better than England, as the people here are not proud; and it is a man's principle, not his money, that makes him a gentleman." As my letter is much swelled by these extracts, I shall reserve my "comments and counsels," till another occasion.—A. PETTIGREW, *Woodside Gardens.*

TOBACCO—SHORT CUT AND PIG TAIL.—The entire tobacco crop of the United States for the year 1850, amounted to 200,000,000 lbs., or about 200,000 hhds., the average value of which was sixteen million dollars. Of this, 31,000 hhds., or nearly one-half of the entire product were consumed in the United States.

In 1840 the average consumption to each person was 2 lbs. 12 oz.; in 1850, 3 lbs. 8 oz.

A German statistician, who has given his mind to the subject, says, the "liquor" extracted from the tobacco by chewers is so great, that if they could all spit into the crater at once, they would extinguish the fires of *Aetna*.

THE TALLEST YET.—Mr. J. Bonner, of Lowell, writes to the *Lowell News*, that while on a visit to Andover, he saw a stalk of corn *nineteen feet high and it had fourteen ears of corn on it*.

WHEN you go into a crowd, always pick your own pockets before you leave home.

American Agriculturist.

New-York, Wednesday, April 26, 1854.

BOUND VOLUMES.—We have a few sets (26 numbers) of volume eleventh, bound and unbound. The price, at the office, of the unbound volumes is \$1.00. The bound volumes are neatly put up in cloth covers, gilt backs, at \$1.50.

We can also furnish the covers separately, gilt and all ready for putting in the paper, for twenty-five cents each. With the covers thus prepared, any bookbinder can complete the binding for twenty-five cents. Volumes sent to the office will be bound complete for fifty cents.

We are having printed a new edition of the first ten annual volumes of the monthly *Agriculturist*, which can be supplied for \$1.25 per volume or \$10 for the set of ten volumes.

BACK NUMBERS.—We have taken the precaution to print each week a large number of extra copies, so that we can still supply new subscribers with full sets from the beginning of this volume, (March 15.) Any copies accidentally lost by a subscriber, will be freely supplied. Specimen copies sent to any person, whose address is furnished post-paid.

OUR PAPER.—On the first page will be found an article of considerable importance on the Turnip Disease. On the fifth page is a fine cut of a Fir Tree. Our usual variety of agricultural and horticultural articles adapted to the season, will be found in different parts of the paper.

Several letters have been received from Correspondents which we have not space for inserting or noticing this week.

WHAT IS THE BEST KIND OF BARN-DOOR FOWL FOR ME TO GET?

This pregnant question is asked us nearly every week in the year, by persons about to stock their premises with hens for their own family use. They do not wish to embark in the chicken trade; neither have they caught the hen fever. They have heard great stories of the Shanghais, and read others equally astonishing of many more breeds or varieties. Our inquirers are not ignorant people, yet they don't believe every chicken story they hear, or read. They have a reasonable share of common sense, some fancy for nice things; and want to provide themselves with handsome, well-formed, prolific, hardy, plump, good-sized birds, for which they will pay a round price, as hens go; but are not disposed to venture the fifty-dollar-a-pair figure upon them.

For people of such reasonable desires as these, we are willing to devote time to impart a portion of the results of our own experience, permitting them to apply it as they choose, without wishing to obtrude advice upon them.

Our first essay at hen-keeping commenced at the age of ten years. Residing then in a large, rambling, country village, where most of the houses had "home lots," with deep front yards, and neighbors at several rods distance, every one could keep barn-door fowls without annoyance to others. To be sure, as there was a large garden attached to the house, our parents objected to the poultry; but as they pretty soon found out that it was better for their boys to

amuse themselves with something about home, instead of running at large in the streets, the chickens were admitted without further objection. There were no poultry books in those days, at least in America—so our father told us, after ransacking the entire city of New-York for a copy in one of his visits there some forty years ago. Thus we had to live and learn. We had an eye for a chicken, if not for our school lessons, and after a week's ransacking of the various farm-yards in the neighborhood, we became possessed of a dozen of the prettiest birds that could be got together. They seem beautiful, even now, as we cast a longing, lingering look back to the sunny days of our boyhood. There were no "fancy" fowls in those days, at least in that quarter, for this was in the interior of Massachusetts, where foreign fashions in such things seldom intruded. These chickens bred finely, and for some years; and every autumn we were sure to introduce some new bird into the yard, possessing the important qualities of stamina and beauty, which we so much admired. We had eggs in abundance; and the fowls served up for the table were plump, tender, and juicy. The neighboring boys often came to us for a "swap" to better their own flocks of fowls; and now and then a sturdy farmer, on looking at them, would propose a "dicker," and offer a dozen, or half dozen eggs "to boot" in the exchange of a "rooster." In short, our chickens were of the best in that region, and so they continued while we bred them.

For twenty-five years past we have *experimented* with almost all sorts of chickens which have come under our knowledge, and with the assistance of all the chicken literature of the day. Our experiments have been attended with varied results and success, and the upshot of the whole matter is, that, in our opinion, a hardy, plump, well-feathered, short-legged, medium-sized chicken, for a northern climate, is altogether the most satisfactory for common house-keeping purposes. The speculators and fancy breeders may not say so, but for ourselves *we know it*.

Twelve years ago last autumn, we imported five Dorking fowls direct from London. There was no error in their breeding, for we selected them from the coops of a regular Dorking poulterer. In color, they were beautifully speckled, chocolate, and white, the same as a coop of their descendants recently sold by Col. SHERWOOD, of Auburn, to Mr. McCOMICK, of New-York, and exhibited at the National Poultry Show at Barnum's Museum. We bred these very satisfactorily until the autumn of 1844, when we introduced a cock and three hens, just brought out for us in one of the London packet ships, by Captain MORGAN. These were noble fowls—finer, if possible, than those we already had—but most unfortunately, they had the *roup* on board ship, and not being quite cured of it, gave the disease to the other fowls, and we lost thirty or forty of our best birds by it. The disease, however, came to an end after a few weeks, and for several years we bred as fine flocks of Dorkings as were ever seen together. We bred cocks that at eighteen months weighed 9½ lbs., and hens that weighed 7 lbs. alive, and of the finest models and plumage. Candor, however, compels us to say, that although they were unrivalled in the beauty of their plumage, and in the richness, tenderness, and juiciness of their

flesh, which was well and abundantly laid on at the side bone and breast, they were moderate layers, and thinly feathered; consequently less hardy than we wished them. They were very *high bred*, however, and we bred them in-and-in deeply, being unable to obtain others to cross upon them without making another direct importation. From this cause, probably—for we cannot imagine any other, as no fowls could have been better kept—they ceased, measurably, to lay, and not one-half their eggs hatched when set. Fearing total ruin in our chicken department, two years ago we displaced the Dorking cocks, and introduced a thorough-bred, spirited, shawl-grey game cock into the yard. The immediate consequence of this was the fecundity of the eggs, almost every one hatching that was set, the rearing of almost every chicken, and the replenishing of the yard with a fine, robust stock of beautiful young birds, possessing the valuable qualities, although somewhat lessened size of the Dorking, with the vigor, hardihood, and fecundity of the Game. Selecting our best pullets, we disposed of the game cock—for he was a pugnacious and vindictive rascal—we brought back two or three young Dorking cocks, bred from a part of the old stock at another yard, to which we had removed them, as we still wished to retain a preponderance of that blood. The last year, we raised over a hundred as good chickens as ever graced a barn-yard, yielding as fine, delicate, and juicy flesh as the original Dorkings. They are abundant layers, of good size, beautiful plumage, and altogether, please us exactly. How long we may keep them so, is to be tried, as they are mongrels; but alternating between the Game and Dorking, as necessity may appear to demand—and wanting no others, so long as they breed satisfactorily—we hope to keep them as they should be.

Both the Dorking and Game are ancient breeds. COLUMELLA, who lived in the middle of the first century, accurately described the Dorking, as we now have it, as being the best fowl of his time; speckled in color, of great beauty in plumage, and possessing the fifth toe, which last, however, we consider as a mere superfluity, and none to its advantage. The Game cock is said, on good authority, to have existed in England with the Romans, who probably introduced it there; and to renew the flagging energies of the one, we cannot do better than to resort to a cross with the other. Indeed we would recommend a well-bred Game cock in all cases, as the best cross to infuse stamina, hardihood and fecundity, into a decaying stock of fowls, where *pure* blood is no object.

But as our inquirers may not be able to obtain Dorkings with which to commence their stock of fowls, we would say, take the very best plump, smooth-headed—for we would by no means have croppled crowned chickens, unless the thorough-bred Polands were adopted at once—*white-legged*, hardy hens you can get. Breed to them an active, thorough-bred Game cock, also having white legs, if you can get him. To the pullets of this cross, introduce a good Dorking cock, if you can get one—or if not, still take another cross of the Game, but not further than a second one. Keep up the size as much as possible, holding the bodies near to the ground, selecting, continually, your most robust pullets for breeding, and there can be little doubt you will have a yard of good fowls.

The Dominica hen, well selected and completely bred, is a fine, useful bird. They are of no particular *breed*, only distinguished as Dominicas by their color, which usually indicates hardiness and fecundity. We have seldom known bad hens of this variety.

The Creole, or Bolton Grey, is a nice, plump, hardy bird, an excellent layer, and of fine plumage. They can hardly fail to be a satisfactory and desirable "every day" fowl.

Such are our views, drawn from a prolonged observation, as to the best kinds of barn-door fowls for every day use. If the object be to keep some sort of fancy fowl, without regard to profit or household convenience, we can only advise our friends to look about among the breeding-yards for those which best please their taste, and go at once into such variety as their preference may dictate.

SETTING OUT CABBAGE, TOMATO, AND OTHER PLANTS.

LAST spring we saw a farmer setting out a hundred cabbage plants in the following manner. The plants were pulled up from the seed bed without loosening the ground around them, and as this was pretty compact, three-fourths of the fibrous roots were broken off. He then made a round hole with a stick about half an inch in diameter, thrust in the plant, dropped in earth to fill up the hole, packed it down, poured on a considerable quantity of water, and then covered up the plants with a burdock leaf to keep off the sun's rays, and left them to grow as best they could. We requested the privilege of setting out twenty plants for him, and proceeded thus:

First, we went to the seed bed, and with a flat stick loosened and lifted up a quantity of dirt around the roots, taking care to break very few of the most delicate fibres. We next went to the cabbage ground, and with a hoe prepared a place for each plant by mellowing and pulverising the earth several inches in diameter. We scooped out a large hole with the hand, deep enough for a plant, and set it in carefully, with considerable loose earth still clinging to it. The roots were left spread out just as they had grown, and finely pulverised soil was then sprinkled in to fill up the hole, and carefully pressed down around the plant. We then added about half a pint of filthy water from the swill-pail, and requested that the plants should be left without any protecting covering. Our farmer friend said he could never spend so much time with a few plants. But mark the result.

During the latter part of summer we visited the "cabbage patch," and found that of the 20 plants, one had been cut off by a grub, one had been injured by a careless blow from the hoe, and one had grown feebly, while seventeen of them bore large, solid heads of cabbage. Of the eighty other plants set out at the same time in the same soil, fifteen only had large heads, twenty-nine bore heads of medium size, fourteen had barely lived and were not worth harvesting, while twenty-two had not survived the transplanting.

The next best preferable method we know of to set out cabbages is, to first *grout* them.

It is an error to plant seeds from States further South. In a cold season, only the seed of a colder climate will ripen well.

PLANTING SMALL POTATOES.

WE have given no little attention to this subject for many years, and have settled the matter conclusively in our own minds, that it does not pay to plant small seed. For fifteen years we planted the same nameless variety, on the same soil, and at the end of that time, found no deterioration in the quality or yield, but rather an improvement. We have invariably thrown out from our seed all potatoes less in size than a hen's egg, and also rejected those overgrown, pithy, or irregular shaped.

In some favorable seasons, and on particular soils, those purchasing and planting the small potatoes which we have rejected, have raised crops equal to or more prolific than our own; but one year with another, we have averaged thirty to fifty per cent. better crops of good potatoes, than our small potato neighbors.

What we have found true in regard to potatoes, we have also, by long practice, proved true in regard to other kinds of seed. Our plumpest and earliest grains have always been reserved for propagation, and our neighbors can testify that our practice has been attended with good results.

HOW TO APPLY SUPER-PHOSPHATE.

ALMOST every mail brings inquiries from our subscribers in regard to the method of applying super-phosphate of lime. Although we have given such directions in several articles upon this fertilizer, it may be useful to sum them up here.

With this, as with every other manure, it is very desirable to have it mixed as thoroughly as may be with that portion of the soil which is to be reached by the roots of the growing crop.

For crops growing in hills, it is probably more economical to make the application in, or around the hill. It is not good economy, however, to simply drop in a handful and leave it nearly all in one place. It should be sprinkled over a square foot or more of the surface, and be dug into the soil before or during planting.

For crops not in hills, it should be sown evenly over the surface, and incorporated with the soil by harrowing well.

It is desirable that all application should be *experimental*, and on this account some unmanured strips should in every case be left running through central portions, and in such a position that they will not be affected by washings or soakings from those parts where the application is made.

On grass and on winter wheat, the application of the super-phosphate can only be made as a top-dressing. It is preferable to apply it during or just before a gentle shower. We advise to try the effect of dividing the top-dressing into two or three portions, and apply them at intervals of two or three weeks.

In applying commercial super-phosphate, which is in a finely-divided state, we do not think it necessary to mix it with any other substance, unless it is to come directly in contact with the seed. In the latter case, it should be well mixed previously, with a considerable quantity of muck, or rich earth, or even with loam.

It is hardly worth while to apply less than 200 lbs. to an acre; on poor soils, or those of ordinary quality, 400 or 500 pounds per acre

would not be too much. We prefer the latter quantity for experimental trials, though we would advise using different quantities on adjacent plots, in order to better mark the effects. 200 lbs. per acre would only allow about one pound to 218 square feet, which is a plot a little less than 15 feet square. This is only two-thirds of an ounce to a square yard. Double this quantity would be little enough from which to judge any thing of its effects.

On hoed crops it is desirable to apply upon portions of the field, a top-dressing sown broadcast just previous to one or more of the hoeings.

In all applications of special manures, let there be a constant comparison of the manured portions with those unmanured, for two or three seasons, so that each one may decide for himself whether these applications PAY.

AGRICULTURE IN VENEZUELA.

[WE have received from a highly intelligent friend and correspondent, himself a native and citizen of Venezuela, the subjoined article on the agriculture, commerce, and prospects of that promising country, which we doubt not will be perused with great interest by all our intelligent readers.]

This branch of industry is the great source of national prosperity in Venezuela, and the cause of the active commercial intercourse she maintains with Europe and North America. It has greatly increased during the last few years, on account of the protection and encouragement it has received from the present Government.

The Government and Executive Power have resolved to free all national productions from all export duties. They aid and protect all enterprises for navigating the lakes and rivers, such as the Orinoco in the Province of Guayana, the Yaracuy in Barquicimeto, and the Zulia in Maracaibo, besides many others in different provinces. They have contracted for the construction of a railroad from Puerto Cabello to San Felipe, and assisted the undertaking with funds from the public treasury. Puerto Cabello is the second port of the Republic, as regards its entries, and the first in a topographical view. San Felipe is fertile in the most valuable productions, enjoys a healthy climate, and many other advantages which render it worthy the attention both of natives and foreigners. The government has also entered into a contract for the construction of a carriage road, to connect the navigation of the Lake of Tacarigua with the city of Valencia; and finally, the government of Venezuela is engaged in the consideration of a privilege to be granted for 90 years, for the construction of a railroad from La Guaira through the fertile valleys of Aragua and Carabobo, to terminate at the wharves of Puerto Cabello.

We entertain well grounded hopes of seeing all these works completed in a short time, and from that day, Venezuela will take her place amongst the first agricultural countries. Now, whilst she enjoys no facilities for transporting the products of her vast and fertile territories, she yet exports 40,000,000 lbs. of coffee, double the amount of former years. When the roads just mentioned are open, and the steam navigation of the rivers and lakes in operation, the production of coffee, which is the staple of the country, and also of sugar and cotton, will be immense. The railroad from La Guaira to

Puerto Cabello will render all the lands at present uncultivated in the Province of Aragua very valuable, as also a great part of those in the Province of Guarico. The railroad to San Felipe will produce the same effect on the uncultivated portions of the cantons of Finaco, Montalvan, Nirgua, Valencia, Puerto Cabello, and San Felipe.

The Government of Venezuela, in consequence of its resolution to afford the most efficient protection to agriculture, has exempted from all import duties every sort of agricultural implements or machines. In the year 1853, articles of this class, and some other machines and instruments for the construction of roads, &c., also free of duties, were imported into Venezuela, to the amount of \$841,068 98, of which the proportion furnished by the United States (one of the eleven nations holding commercial intercourse with Venezuela) amounted to \$339,629 68.

The commerce of Venezuela with the United States increases daily, as may be seen by the following data: In 1852, the value of \$1,870,971 96 was taken in coffee, cocoa, and hides, from Venezuela by the ports of New-York, Philadelphia, Baltimore, and Boston; in return, their exports in agricultural instruments, &c., to Venezuela amounted to \$197,233 70. In 1853, the same ports took from Venezuela to the value of \$2,100,069 95, according to her market prices, and returned to her in agricultural and other instruments, free of duties, the sum of \$339,629 68.

THE WHEAT CROP.

DURING a recent excursion through Canada, New-York, a part of Pennsylvania, New-Jersey, Delaware, Maryland, Virginia, Ohio and Indiana, we obtained considerable information in reference to the growing crop of winter wheat, by personal observation and careful inquiry of intelligent persons, which may be interesting to a large portion of our readers.

Throughout Canada, the breadth of ground covered with wheat is considerably larger than last year, and very little has been winter killed,—the earth having been covered with snow nearly all the winter months,—and the fields present a very thrifty appearance. In New-York, there is probably no increase of acres, and the fields have suffered some from frost, though favorable weather during May and June will cause a good yield in the aggregate. In New-Jersey, there is supposed to be less land covered, but the prospect is good—never much better. In Pennsylvania, there is a large increase in acres, and the fields look matted, and present a dark green color, indicating a luxuriant growth. Several persons from the Western Counties reported the condition of the crop in their locality equally favorable. In Maryland,—especially in the beautiful and rich section of country around Frederick City, where nearly half of the cleared lands are in wheat,—the crop promises equal to any that we ever saw. The number of acres is also one-half greater than last year. The same is true, we were told, of Washington County. Along the line of the Baltimore and Ohio Railroad, as far west as Cumberland, there is also an increase of acres, though altogether not much, and the crop looks well,—remarkably so, considering the broken and mountainous character of the county. In Eastern Virginia, the prospect was said to be good, and in Shenandoah, Rockingham, Page and Augusta counties, which constitute the best wheat sections of the State, the number of acres sown is one-fourth larger, and never was a better crop expected. Along the Ohio river counties in Virginia, there is not much sown, but the crop looks fair. In Ohio there has been considerable complaint, that the young sprouts were considerably injured, especially in the river

counties, but so far as we could observe, the fields looked thrifty. In the interior counties also the condition of the crop was favorably reported. In Indiana, the crop looks thrifty, and the amount of acres covered is considerably larger. In the southern counties, we heard there was not a good prospect, but that is not a wheat growing section, and a partial failure there cannot sensibly affect the result of the crop of the whole State.

On the whole, we are confident that there have been few springs, within a period of fifteen years, when the wheat crop looked more promising in the States mentioned, than it does at this time. The high price which wheat has commanded since last harvest, has doubtless caused an increase in the number of acres sown of at least one-fifth over last year, and should this season prove generally favorable, the surplus will not fall far short of 50,000,000 bushels. Nevertheless, slight causes, apparently, such as *rust*, may reduce the average yield so much as to leave but little surplus for export.—*Chicago Tribune*.

MORAL SUASION ON A RAM.—When a friend of ours, whom we call Agricola, was a boy, he lived on a farm in Berkshire county, the owner of which was troubled by his dog Wolf. The cur killed his sheep, knowing, perhaps, that he was conscientiously opposed to capital punishment, and he could devise no means to prevent it. "I can break him of it," said Agricola, "if you will give me leave." "Thou art permitted," said the honest farmer—and we will let Agricola tell the story in his own words.

"There was a ram on the farm," says Agricola, "as notorious for bunting as Wolf was for sheep-stealing, and who stood in as much need of moral suasion as the dog. I shut Wolf up in the barn with this old fellow, and the consequence was, that the dog never looked a sheep in the face again. The ram broke every bone in his body literally. Wonderfully uplifted was the ram as aforesaid by his exploit; his insolence became intolerable; he was sure to pitch into whomsoever went nigh him. 'I'll fix him,' said I, and so I did. I rigged an iron crowbar out of a hole in the barn, point foremost, and hung an old hat on the end of it. You can't always tell when you see a hat, whether there is a head in it or not; how then should a ram? Aries made at it full butt, and being a good marksman from long practice, the bar broke in between his horns and came out under his tail. The little admonition effectually cured him of bunting."

BLOOD AS A MANURE.—As Mr. Way observes, "this manure is disregarded." This is true in point of practice, but not so in the knowledge of the scientific farmer; the fact is, we cannot obtain it; it is a most invaluable manure, and we know by the application of blood absorbed by ashes, road scrapings, soot, &c., drilled with turnips and for wheat, the yield of the latter was 40 bushels an acre, and the turnip crops magnificent. If slaughter-houses were provided with large tanks to receive the blood, and ashes, soot, &c., mixed with it, any farmer would be glad to give 10s a cart-load, if not more, for so valuable a manure, much of which finds its way into our rivers. All gardeners know the value of blood when applied to the roots of the vine.—ALEXANDER FALCONER, *Hants*.

SHAME! SHAME!—We saw in the Philadelphia market, last week, several large bunches of Robins, which had been shot and brought there for sale! We pity the poor creatures who could be guilty of destroying this favorite domestic bird, at a season of the year, when they are pairing and fixing upon their summer abodes; but as this is not likely to restrain these unfeeling persecutors of the Robin, we hope the penalties of the law for the killing of insectivorous birds, will be inflicted in every instance. An example or two would put a stop to the cruelty.—*Germantown Telegraph*.

Boys' Corner.

For the American Agriculturist.

MARCH FOURTH.

MILL PLAIN, Ct., April 19, 1854.

I NOTICED in your paper of March 29th, an article stating the reason why the 4th of March was chosen for the inauguration of the President of the United States. The reason given was, that the 4th of March in every year, commencing from the first inauguration, cannot come on Sunday for at least 300 years. This, I think, is a mistake, for it came on Sunday in 1849, when General TAYLOR was inaugurated, and will come on Sunday once in 28 years. I remember hearing it spoken of, and seeing it in some paper, that we were without a President one day, and yet we were governed just as well. It also came on Sunday in 1821, the second term of JAMES MUNROE.

A YANKEE BOY would like to know if he is correct.

We have not examined the matter, but we think "Yankee Boy" is right, and we are glad he has been so wide awake as to notice and correct the error. There are many of these items that go the rounds of the papers, because nobody stops them. We are very cautious about printing these, but sometimes make a mistake when in a hurry, just as in the above instance.

Can any one now give us the true reason for choosing March 4th?

ARE YOU KIND TO YOUR MOTHER?

COME, my little boy, and you, my little girl, what answer can you give me to this question? Who was it that watched over you, when you was a helpless baby? Who nursed and fondled you and never grew weary in her love? Who kept you from the cold by night, and the heat by day? Who guarded you in health, and comforted you when ill? Who was it that wept when the fever made your skin feel hot, and your pulse beat quick and hard? Who hung over your little bed when you were fretful, and put the cooling drink to your parched lips? Who sang the pretty hymn to please you as you lay, or knelt down by the side of bed in prayer? Who was glad when you began to get well, and who carried you in the fresh air, to help your recovery? Who taught you how to pray, and gently helped you to learn to read? Who has borne with your faults, and been kind and patient with your childish ways? Who loves you still, and contrives, and works, and prays for you every day you live? Is it not your mother, your own dear mother? Now then, let me ask you, "Are you kind to your mother?"—*Exchange*.

THE OLD MAN.—Bow low the head, boy; do reverence to the old man. Once like you, vicissitudes of life have silvered the hair, and changed the round merry face to the worn visage before you. Once that heart beat with aspirations coequal to any that you have felt; aspirations crushed by disappointment, as yours are perhaps destined to be. Once that form stalked proudly through the gay scenes of pleasure, the beau ideal of grace; now the hand of Time, that withers the flower of yesterday, has warped that figure and destroyed the noble carriage. Once, at your age, he possessed the thousand thoughts that pass through your brain, now wishing to accomplish deeds worthy of a nook in fame, anon imagining life a dream that the sooner he awoke from, the better. But he has lived the dream very near through. The time to awake is very near at hand; yet his eye ever kindles at old deeds of daring, and the hand takes a firmer grasp of the staff. Bow low the head boy, as you would in your old age be revered.

Miscellaneous.

For the American Agriculturist.

NOT ABOUT SCHOOLS,

BUT TO BOYS WHO HAVE NO SCHOOLS TO WHICH THEY CAN GO.

AND why, says the inquirer, address a letter to such, when not one in a thousand can read, and not one in a hundred thousand of those who can read, will ever see this article in the *Agriculturist*. Well, it is for this one, I write this article. Be it so; but if one in a hundred thousand shall be rescued from mental darkness, and put into the road leading to self-culture, and consequently to eminent usefulness, (for such are always more so than those fostered in schools and colleges,) I shall feel myself amply rewarded. Another class may object and say, no part of these United States can be found in this state of destitution. To such I will answer, read the reports of the colporteurs sent out by the Bible and American Tract Societies, and you will learn that millions of square miles (not in one body) are settled with a people grossly ignorant; destitute not only of the Bible and religious books, but of all books; and we have not to go far from this city to find such a region of country.

To boys thus situated, I will say, if your parents are ignorant—which they must be, thus to neglect you—and if society takes no interest in your welfare, make use of such means as a kind Providence has placed within your power. Go to the nearest store—not a rum-hole—and ask the store-keeper to procure for you three or four primary books, beginning with Stanley's Pictorial Primer, or a primer of any other author, and you will surely find some one to teach you the letters, with their proper sounds, after which you can learn to read. When this is accomplished, you can, without a teacher, learn arithmetic.

If this doctrine be true, many tax-payers for the support of public schools may be ready to say, what is the necessity of all this expense of our educating the common people? To this objection the answer is obvious. Children of both the rich and the poor, as a general thing, would never of themselves learn to read; and since the birch has been laid aside, and moral suasion introduced in its place, the diligent, patient, untiring teacher is subjected to every annoyance on the part of the children, who have never been taught the first lesson of obedience at home. They are impatient of all restraint when sent to school, and the sufferings of the teachers become more intolerable, if possible, than those of some of our chief magistrates of these United States, in days that are past, and are now only told as history. Nevertheless, the laxity in their government answers the design for which they are intended, and but for them, with all the overwhelming flow of ignorance annually pouring in upon us, we should in the next generation be approaching to some of the European States, with a pope for our dictator, and a despot to execute his decrees. But the boys, for whose benefit I commenced this article, may exclaim, when some kind friend who can read, is reading it to them, "We don't understand this." But you will soon be able to understand it if you will learn to read, which

you can do if you have the desire. No American need grow up in ignorance, unless it be his own voluntary choice, but may obtain an education sufficient to guard him against the imposition of those who know more than he does, and to make him an intelligent and respectable member of society.

ALMOST AN OCTOGENARIAN.

A HINT TO MOTHERS.

"I wish I needn't go to school, to-day," said Johnny to his mother, one bright, pleasant morning. "I don't like my school, and never did; I don't want to go."

This was a feeling which Johnny had always had, and it was his mother's fault that he had it; for from the time he was two years old, whenever he had been doing any thing wrong, or had been noisy about his play, his mother had always said, "If you are not a good boy, I'll send you right off to school;" so that he had grown up with the feeling that school was of all other places the least to be desired.

If he had committed any little misdemeanor in the morning, he was started off for school a full half hour earlier than usual, as a punishment. Johnny must indeed be a genius to withstand such influence. Would it not be better for every mother to teach her children to love school; to inspire them with ambition to attend school; to be always punctual, and always prepared with good lessons? Would it not be better to have all the errands attended to the evening before, so as to insure a punctual attendance? Would it not be better to neglect every other morning duty rather than allow a single child to be five minutes late?

Mothers are hardly aware how much they can encourage their children by expressing an interest in all that concerns the school; listening to the story of their sports in recess, and seeking for a detailed account of each day's recitations; not with a view to finding fault, but simply to show an interest, which is always delightful to a child. If they have failed in one recitation, encourage them to feel that the next will certainly be perfect.

Let the sunshine of a mother's love fall into every child's heart, and let her words of encouragement to do well—yea even to excel—lead many a wanderer who now hates his school, to love it, and seek it as a delightful place.—*Norwich Examiner*.

HOME POLITENESS.

Why not be polite? how much does it cost to say, "I thank you?" Why not practice it at home? to your husband? to your children? to your domestics? If a stranger does you some little act of courtesy, how sweet the smiling acknowledgment! if your husband, ah! it is a matter of course; no need of thanks.

Should an acquaintance tread on your dress, your very, very best, and by accident tear it, how profuse you are with your "never minds, don't think of it, I don't care at all;" if a husband does it, he gets a frown; if a child, it is chastised.

Ah! these are little things, say you. They tell mightily upon the heart, let me assure you, little as they are.

A gentleman stops at a friend's house, and finds it in confusion. He don't see any thing to apologize for—never think of such matters. Every thing is all right—cold supper, cold room, crying children—perfectly comfortable. Goes home, where the wife has been taking care of the sick ones, and working her life almost out. Don't see why things can't be kept in order—there never were such cross children before. No apologies accepted at home.

Why not be polite at home? why not use freely that golden coin of courtesy? How sweet they sound, those little words, "I thank you," or, "You are very kind." Doubly, yes, thrice

sweet from the lips we love, when heart-smiles make the eye sparkle with the clear light of affection.

Be polite to your children. Do you expect them to be mindful of your welfare? to grow glad at your approach? to bound away to do your pleasure before the request is half spoken? Then with all your dignity and authority, mingle politeness; give it a niche in your household temple. Only then will you have learned the true secret of sending out into the world really finished gentlemen and ladies.

What we say, we say unto all—Be polite.

PROFESSOR MORSE AND THE TELEGRAPH.

A WASHINGTON correspondent of the *Tribune* gives the following interesting item, which we extract from a letter dated the 16th inst.

Professor Shaffner, Secretary of the American Telegraph Confederation, is at present in this city, and he has kindly placed at my disposal the following statistics and information. Ten years ago Professor Morse was just erecting the first experimental line of Telegraphs, between this city and Baltimore. Professor Morse, like all scientific benefactors, had exhausted his means, and had become as poor as Lazarus, and as lean and hungry-looking as any veritable Calvin Edson you ever saw. One day while eating a sumptuous dinner of bread and molasses under the shade of a tree, about two miles from Washington, Amos Kendall approached him with such a lean and hungry look, that he at once divided his dinner with him, and before it was concluded, he gave the dilapidated Post-master-General an interest in his Telegraph patent, which has since made these two shadows of a shade corpulent with wealth. They now "have lands and beeves," like master Robert Shallow, Esquire. There are now 41,392 miles of telegraphic wires in this country, with a capital stock of \$6,671,800. Professor Shaffner is perfecting a system of union and concert between the various lines in this country, with a prospect of an ocean line soon to be laid, connecting us with the Trans-Atlantic Telegraph, so that the close neighborhood of nations may be considered as settled.

R. M.

A FOX'S REVENGE.

A RESPECTABLE man of the county of Montgomery resided on the banks of the Hudson river. One day he went to a bay on the river, to shoot ducks or wild geese. When he came to the river, he saw six geese beyond shot. He determined to wait for them to approach the shore. While sitting there, he saw a fox come down to the shore, and stand some time and observe the geese. At length he turned and went into the woods, and came out with a very large bunch of moss in his mouth. He then entered the water very silently, sank himself, and then, keeping the moss above the water, himself concealed, he floated among the geese. Suddenly, one of them was drawn under the water, and the fox soon appeared on the shore with the goose on his back. He ascended the bank, and found a hole made by the tearing up of a tree. This hole he cleared; placed in the goose, and covered it with great care, strewing leaves over it. The fox then left; and while he was away the hunter unbent the goose, closed the hole, and resolved to await the issue. In about half an hour the fox returned with another fox in company. They went directly to the place where the goose had been buried, and threw out the earth. The goose could not be found. They stood regarding each other for some time, when suddenly the second fox attacked the other most furiously, as if offended by the trick of his friend. During the battle he shot them both.—*Murray's Creation*.

WHAT is the particular sorrow of a *sad iron*?

A GEM.—Who wrote the following beautiful epitaph upon an infant? It speaks to the heart:—

Beneath this stone, in sweet repose,
Is laid a mother's dearest pride;
A flower that scarce had waked to life
And light and beauty, ere it died.
God in his wisdom has recalled
The precious boon his love had given;
And though the casket moulders here,
The gem is sparkling now in heaven.

DOMESTIC DUTIES.—The elegant and accomplished Lady Mary Wortley Montague, who figured in the fashionable as well as in the literary circles of her time, has said that "the most minute details of household economy become elegant and refined when they are ennobled by sentiment;" and they are truly ennobled, when we attend to them either from a sense of duty, or consideration for a parent, or love to a husband. "To furnish a room," continues this lady, "is no longer a common-place affair, shared with upholsterers and cabinet-makers; it is decorating the place where I am to meet a friend or lover. To order dinner is not merely arranging a meal with my cook; it is preparing refreshments for him whom I love. These necessary occupations, viewed in this light by a person capable of strong attachments, are so many pleasures, and afford her far more delight than the games and shows which constitute the amusements of the world."

A PLEASANT PROSPECT.—When Socrates was asked whether it was better for a man to marry or remain single, he made answer, "Let him take which course he will, he will repent it." The reply is similar to that of the youth who, being asked which out of the two very bad roads to a certain place was the least bad, cried—"Take either, and before you get half-way, you will wish you had taken the other."

THE DUTIES OF LIFE.—Some writer enumerates the following, among other duties of life:—"Every man ought to pay his debts—if he can. Every man ought to help his neighbor—if he can. Every man and woman ought to get married—if they can. Every man should do his work to suit his customers—if he can. Every man should please his wife—if he can. Every wife should please her husband—if she can. Every wife should sometimes hold her tongue—if she can. Every lawyer should sometimes tell the truth—if he can. Every one should take a newspaper, and pay for it—if he can."

THE MANNER OF DOING A SERVICE TO OTHERS.—When your endeavors are directed towards doing good to an individual—in other words, to do him service—if there be any opinion as to the mode or way, consider and observe what mode is most to his taste. If you serve him as you think and say, in a way which is yours, and not his, the value of any service may, by an indefinite amount, be thus reduced. If the action of serving a man, not in the way he wishes to be served, be carried to a certain length, it becomes tyranny, not beneficence—an exercise of power for the satisfaction of the self-regarding affection, not an act of beneficence for the gratification of the sympathetic or social affections.—*Jeremy Bentham*.

IRON BUILDINGS.—An association has been formed in Brooklyn, with a capital of \$150,000, for the erection of iron dwellings, and property has been purchased with a view to the erection of a foundry. It is claimed that buildings, such as are designed for small families, can be put up for \$500 or \$600, or for from one-half to one-third of the ordinary expense. There have already been twenty-eight buildings of this kind

erected in Baltimore and sixteen in Philadelphia. The ceilings, walls and floors are made of glass. —the latter being formed of a beautiful pure white sand, found in Connecticut, which needs only to be melted under electric heat, and colored, if desired, to produce the desired article. The association is called the Long Island Iron Building Co. See advertisement.

"PAID DOWN UPON THE NAIL."—The origin of this phrase is thus stated in the *Recollections of Keefe*, the dramatist:—"An ample piazza under the Exchange (Limerick) was a thoroughfare; in the center stood a pillar four feet high, and upon it a circular plate of copper, about three feet in diameter; this was called the nail, and on it was paid the earnest for any commercial bargains made, which was the origin of the saying, 'Paid down upon the nail.' Perhaps the custom was common to other ancient towns. —*Notes and Queries*.

A SIGN OF THE TIMES.—Every one who makes a discovery now-a-days, of any kind, straightway turns about to find way of realizing its value in gold and silver. We believe that if a man were to discover a certain cure for all diseases, he would allow some two or three generations to die from plagues and pestilences, before he would divulge it without a reward in the shape of some hundreds of thousands of dollars. We doubt whether an age more given to Mammon worship was ever known from the beginning of the world. A certain scriptural phrase is now practically altered to read: "You must contrive somehow to serve God and Mammon."

SPECIAL NOTICE TO ALL SUBSCRIBERS.

We find that by using such good paper, our volume of 832 pages will be quite large to bind, and especially large for those who wish to stitch their paper together with an index, without being at the expense of binding. To obviate this, we have concluded to be at the expense and trouble of making out an extra index with No. 26, so as to form a complete volume of the first 26 numbers. The index for the next 26 numbers will be given at the end of the year, or with No. 52. This arrangement will make it convenient for all, as the 52 numbers can be stitched or bound in two volumes with an index for each, or in one volume with the double index at the close.

We hope all will preserve their numbers, for there are many single articles each of which will be worth the price of the volume, for future reference. When the paper arrives from the post-office, a good plan is to see that it is properly folded, and then pin or sew it through the middle and cut open the leaves. It is very easy to stitch 26 numbers together. To do this, arrange them in regular order, and with an awl punch several holes about one-fourth of an inch from the back, and through these run a strong thread two or three times with a darning-needle, and the work is done. We have scores of volumes of papers, pamphlets, and addresses, thus prepared, which serve all the purposes of a bound volume, and occupy less room in storing and carrying. We would, however, prefer to see volumes of agricultural papers neatly bound and laid upon the book-shelves or tables of farmers. They are much better and more appropriate ornaments, than gilded volumes of trashy magazines or novels.

ONE WORD MORE.—We thank our friends for the liberal aid they have afforded us in extending the circulation of the *Agriculturist*. Our list has increased beyond our expectation, and we are daily encouraged to labor with the utmost diligence, to make our paper worthy of the confidence and admiration of our largely increasing list of readers. Our reliance for the continuance and increase of our list is upon those who are already readers. As stated above, we now divide the year so as to give either one

or two complete volumes of the 52 numbers. Number 27 begins the second volume, or half of the year. We respectfully request all our present subscribers to make a little exertion at this time, and each send us on at least one new name. If you cannot get your neighbors to send on for a year, ask them to try the paper for six months, as in that time they will get a complete volume.

TO CORRESPONDENTS.—We have several communications on hand which we will look over as soon as we have time, and some of them will be published. It is no trifling labor to prepare for the printer many communications which we receive. Some are written so closely that there is not room to put in corrections, without re-writing the whole. We cheerfully prepare articles, unless there is manifest want of care on the part of the writer. If he does as well as he can, we make all needful changes and corrections.

As most writers doubtless wish to improve their own style, we suggest to them to keep an exact copy of their communications, and then compare this copy with the printed sheet. They may often learn something in this way.

We are not anxious to receive original poetry. We have little space for rhyme, and we have good selections enough to last us a year at least. Good poetry, however, will not be rejected; but we advise all who attempt to write in verse to remember, that good rhyme does not constitute good poetry; on the contrary, some of the best poetry we have ever seen does not "rhyme" at all, while some of the best rhyme contains not a single poetic sentiment.

Markets.

REMARKS.—Flour has declined from 12½ to 25 cts. per bbl. the past week. Corn has advanced from 1 to 2 cts. per bushel. Lard, ½ a cent higher. Wool very active.

Cotton has advanced ¼ to ½, and Sugar ¼ to ½ of a cent per lb.

Money and Stocks remain so stationary that we shall not take further note of them till some change.

The weather is now fine, but still cool for the season. It is the most extraordinary April we ever knew in this climate, and the last fall of snow we had is deserving a record. It began to fall on Friday afternoon, the 14th, and continued snowing till Sunday morning the 18th, the wind blowing a strong gale from the N. E. all the while. Had not a good deal of the snow melted as it fell, it would doubtless have been 18 to 20 inches deep. As it was, it remained 4 to 6 inches deep Tuesday morning in the city and neighborhood. More or less is now (Monday, April 24th,) lying in hallows and in strips under the fences, and in the forests all around us. We hope a vestige may not be seen three days hence. The gardeners are now busy planting again.

PRODUCE MARKETS.

Wholesale prices of the more important Vegetables, Fruits, &c., at the principle New-York Markets.

In our weekly reports we give the prices which producers actually get, and not the prices at which produce is sold from the market.

April 22, 1854.

VEGETABLES.—Potatoes, Western Reds, @ bbl., \$2 50 @ \$3; Junes, \$3 @ \$3 50; Mercers, \$3 50 @ \$4; Carters, \$3 50 @ \$4; Turnips, white, @ bbl., \$2; yellow, \$2 25; Spinach, @ bbl., \$2 50; Onions red, @ bbl., \$1 75; white, \$3; yellow, \$2; Parsneps, @ bbl., \$1 75; Lettuce, @ doz. bunches, 25c @ \$1; Radishes, @ doz., 32c @ 42c; Asparagus, @ doz., \$1 00; Parsley, @ doz., 62½c; Vegetable Oysters, @ doz., \$1. FRUITS.—Apples, a good article is worth @ bbl., \$4; poorer quality from \$3 @ \$3 50. Maple Sugar, 10c @ 12c. @ pound. Butter, Ohio, 12½c @ 14c. per pound. New-York old butter, 20c @ 26c; new, 26c @ 28c. Eggs, 16c @ 17c. @ dozen.

NEW-YORK CATTLE MARKET.

Monday, April 24, 1854.

The number of cattle in market to-day is a little less than last week, though the weather is very fine. Prices are ruling somewhat higher, and sales are not so brisk, as both holders and buyers are firm. There are some fine cattle, though most of them are worth more now for the stall than the shambles. Those showing the most care in feeding, were from Lancaster Co., Pa. There were two yoke of oxen from the Western Reserve, Ohio, for which about \$350 were asked per pair, but we did not see them sold. They belonged to J. ENST and H. H. Coz, and were said to weigh on leaving home, the one 5100, the other 4900.

Prices range from 9@11c. per pound.

Washington Yards, Forty-fourth street.

A. M. ALBERTON, Proprietor.

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY

BERKSHIRE, LINCOLNSHIRE, AND SUFFOLK SWINE.

FOR SALE—THE ENTIRE STOCK OF SWINE NOW owned by SAMUEL LOVE, consisting of Berkshire, Lincolnshire, and Suffolk breeds of all sizes. This stock is worthy the attention of Farmers and others who wish to procure the above breeds. The above swine have a good reputation, and have received the principal prizes at the exhibitions of the American Institute.

Gentlemen living at a distance can have them boxed and shipped from New-York.

Refer to A. B. ALLEN, editor of this paper, or to the Managers of the American Institute.

Letters addressed to A. B. ALLEN, will meet with immediate attention. SAMUEL LOVE.

33-44. Corner of 53d Street and 6th Avenue, New-York.

KETCHUM'S MOWING MACHINE.

ALSO VARIOUS REAPING AND MOWING MACHINES, combining all the latest improvements. NEW-YORK AGRICULTURAL WAREHOUSE & SEED STORE, 189 and 191 Water Street. R. L. ALLEN.

A GOOD FLORIST WANTED—APPLY TO DR. E. PARSONS, Savannah, Georgia, or to the editor of this paper.

BERKSHIRE SWINE.

WANTED—TWO FEMALES, SIX TO EIGHT MONTHS old. They must be of good size, fine and pure bred. Please state lowest price. A. B. ALLEN, 189 Water st.

PIGS WANTED.—A GOOD PAIR OF BERKSHIRE PIGS of suitable age to ship to the south at once.

Those having the Pure Breed will please address C. M. SEXTON, Agricultural Book Publisher, New-York.

SEACOR MAMMOTH BLACKBERRY. (BY SOME CALLED THE LAWTON BLACKBERRY).—Lewis A. Seacor, the first discoverer and propagator of this rare and valuable fruit, respectfully informs the public, that although having thus far lost the honor of giving name to his fruit, yet he has on hand about one hundred fine plants of the original stock, from which others have chiefly been derived. These plants he will warrant of superior quality, and will sell them at \$5 per dozen, (which is half the price asked by those who procured their original plants of him at a low price.)

LEWIS A. SEACOR, New-Rochell, N.Y.

VIRGINIA LAND FOR SALE.

A S COUNSEL AND AGENT FOR THE HEIRS OF DAVID ELLINGTON, dec'd, I offer for sale a tract of land containing about 1000 acres, lying in Prince Edward's Co., Va., on the Richmond and Danville R. R., about 4 miles above its junction with the South Side Railroad. Its location, with respect to the two Railroads, gives it every necessary market facility. The soil is naturally free, and is susceptible of a high state of improvement, but for the last 12 years it has been lying in a neglected state, during a controversy (now recently determined) in respect to the will of the former owner. The present owners reside in several of the Western States, and for this reason it will be sold at a great bargain. One or more skillful and enterprising farmers from some of the Northern States would find a profitable investment in this land. The quantity of timber land is amply sufficient for all the purposes of the farm. Besides the adaptation of soil to the cultivation of tobacco, and all the usual grain crops of the country, it is probable that the hay crop can be made easy and profitable, in consequence of the large quantity of branch flat. It is estimated that the aggregate length of the small streams which water the tract, is from ten to twelve miles! Further particulars will be given, when requested, by the undersigned whose address is "Jasper's Store, P.O. Norfolk, Va." Persons desirous of examining the land can easily do so as it is within two days' travel from the city of New-York.

W. C. KNIGHT.

April 6, 1854.

Cranberry Vines.—100,000 FINE BEARING PLANTS, of the Bell variety, which are commonly raised in New-England: On low ground, with a little care, they bear large crops. They can be forwarded at any time between this and the middle of May, to any part of the United States. A circular, with mode of culture, soil, and price, will be forwarded to all who may want information on the subject.

THOMAS B. THOMPSON, 32-34
April 1st. New-Haven, Ct.

PORTABLE FORGES AND BELLOWES.

QUEEN'S PATENT. THE BEST Forge in the market for Blacksmiths work, Boiler Makers, Mining, Quarrying, Shipping, Plantations, Contractors on Railroads and Public Works, Coppersmiths, Gas Fitters, &c., &c. Also an improved PORTABLE MELTING FURNACE for Jewellers, Dentists, Chemists, &c., both of which are constructed with sliding doors to protect the fire from wind and rain when used out of doors, and for perfect safety and free escape of smoke indoors. They are compact for shipping. Circulars, with particulars and prices, will be forwarded upon application. Cast Iron Columns for buildings constantly on hand. The above forge has been awarded three Silver Medals by the American Institute, New-York, and the highest premium Diplomas and Silver Medals at all other Fairs wherever exhibited. **FREDERICK H. LAGLER,** Sole Manufacturer, 210 Water st., N.Y.

31-57

KETCHUM'S IMPROVED MOWING MACHINE WITH entire change of gear. The only successful mower now known.

Ketchum's Improved Machine, which we are building for the harvest of '54, was thoroughly tested last season, and the advantages gained by our change of Gear are in all respects as we designed, viz: durability, convenience and ease of action. The shafts now have bearings at both ends, which overcomes all cramping and cutting away of boxes. A counter balance is attached to the crank shaft, which gives it a steady and uniform motion. Each Machine can be thrown out of gear; there is great convenience in getting at each and every nut, all of them being on UPPER SIDE OF THE FRAME: oil cups are attached to all the bearings, which, by the use of a wad of cotton, will hold oil for a long time, as well as protect the bearings from dust, grit, &c.; the finger bar is lined with iron its full width, which protects it from wear.

These and various other additions for strength, durability, &c., makes them the most simple and perfect agricultural implements in use. They weigh about 750 lbs. each, and can easily be carried in a one-horse wagon.

They will cut ALL KINDS OF GRASS, and operate well on uneven or rolling lands, or where there are dead furrows. This Machine took the highest award, with SPECIAL APPROBATION, at the World's Fair, it also received, during last season, one silver and four gold medals, and various other flattering and substantial testimonials of approval. We have spared neither pains nor money to make them deserving of public favor, and hope to be able the coming season to supply the great and increasing demand.

We take this occasion to caution farmers against buying UNTESTED Mowers, if they do (as was the case with many last year) they incur loss, vexation and disappointment.

In all cases where Extras are wanted, be sure to give us the NUMBER OF YOUR MACHINE.

(WARRANTY.) That said Machines are capable of cutting and spreading, with one span of horses and driver, from ten to fifteen acres per day of ANY KIND OF GRASS, and do it as well as is done with a scythe by the best of mowers.

All orders filled by the subscribers. Office and Shop, corner of Chicago street and Hamburg Canal, near the Eastern R. R. Depot, in Buffalo N. Y.

Manufacturers and Proprietors, For Sale by R. L. ALLEN, 189 Water street, N. Y.

A CHOICE ASSORTMENT OF FLOWER SEEDS. 23-41

SALE OF STOCK.

PURE BRED STOCK AT PRIVATE SALE AT MOUNT Fordham, Westchester Co., New-York, Eleven Miles from City Hall, N. Y., by Harlem Railroad Cars.

Having met with more success than I anticipated the past year, with the Catalogue of male animals at Private sale, is the reason for offering this lot of animals. AND MY JUNE SALE BY AUCTION, WILL NOT TAKE PLACE. A full descriptive Catalogue with prices attached, will be published on the fifteenth of April, and I intend to be at home myself to see any who may call. I will sell at private sale, about 18 Short-Horns, 6 of which are young Bulls and Bull Calves. The Cows and Heifers old enough, will be in Calf, to the Celebrated Imported Bull "BALCO," (9918) or Imported, "ROMEO," winner of the first Prize at Saratoga, in 1853; and also at American Institute the same year.

The young Bulls and Bull Calves, are some of them from imported Cows, and sired in England; and others are sired by the imported Marquis of Carrabas, (11789) winner of the first Prize at Saratoga, the past year, as a two year old.

Also, about 10 head of Devons, consisting of a yearling Bull, sired by MAJOR, and 5 Bull Calves, sired by my imported first Prize Bull, FRANK CANTLEY, and several of them Devons are in Calf to the imported Bull, MARQUIS OF CARRABAS, (2789). Mr. Becar can be seen at his Store, No. 187 Broadway, New-York, at which place he will make arrangements to go to his Farm, at Smithtown, Long Island. His animals will be entered in the same Catalogue with mine, which can be obtained by addressing him at his Store, or me at Mount Fordham. His animals will be delivered in the same manner as mine. Our Importations have been in almost all cases made at the same time and are of equal merit, excepting that I have more in number.

MY FRIEND MR. N. J. BECAR, who is interested in several of my Importations, will also sell about 10 head of Short-Horns, consisting of 4 young Bulls, and 5 or 6 Females. His young Bulls are also several of them from imported Cows, and sired by the LORD OF ERYHOLMINE, (2265) and the celebrated first Prize Imported Bull ROMEO. Mr. Becar's Cows and Heifers are in Calf to the imported Bull, MARQUIS OF CARRABAS, (2789). Mr. Becar can be seen at his Store, No. 187 Broadway, New-York, at which place he will make arrangements to go to his Farm, at Smithtown, Long Island. His animals will be entered in the same Catalogue with mine, which can be obtained by addressing him at his Store, or me at Mount Fordham. His animals will be delivered in the same manner as mine. Our Importations have been in almost all cases made at the same time and are of equal merit, excepting that I have more in number.

TERMS, Cash on delivery. L. G. MORRIS.

March 16th, 1854. 23-37

26-29-31-33

MORRIS FEMALE INSTITUTE.

THIS INSTITUTION IS SITUATED AT MORRISTOWN, N. J., about an hour and a half's ride from the city of New York, on the Morris and Essex railroad; the cars leaving New York several times a day. It has been ably patronized for the last six years. There will be a vacancy for a few more pupils in April.

Faithful teachers are provided for English branches usually required; also Drawing and Painting, French, Latin, and Spanish under a native teacher.

Vocal and instrumental music by an accomplished player, whose time and attention has been for years devoted exclusively to this object.

Further particulars, and circulars, may be obtained by applying to J. A. SEELEY, Principal, or at the book-store of Messrs. C. Shepard & Co., 132 Fulton street, near Broadway, or at this office.

Persons wishing to send their daughters from home, would do well to visit this Institution before deciding. 27-tf

NO. 1 SUPERPHOSPHATE OF LIME.—THIS VALUABLE fertilizer has been used for several years in England and other parts of Europe, and, next to Guano, holds the highest rank in popularity, and the extent to which it is used among farmers. Its introduction in this country has been more recent; but the progress it has made in the estimation of the public has not been less marked or successful than abroad. It is now extensively used throughout the Northern States, after a full trial and investigation of its merits; and it is rapidly becoming like its predecessor, Guano, a favorite manure at the South and West.

It is composed of crushed or ground bones, decomposed by the addition of about one fifth their weight of sulphuric acid, diluted with water, to which is added a due proportion of guano and sulphate of ammonia. The latter is the active and one of the most efficient agents in the best Peruvian Guano.

It is suited to any soil in which there is not already a full supply of the phosphates, which is seldom the case. All crops are benefited by its application.

For sale in large or small quantities, in bags of 150 lbs. each. No charge for packages. All bags will be branded "C. B. De Burg, No. 1 Superphosphate of Lime."

PERUVIAN GUANO of best quality.

AGRICULTURAL and HORTICULTURAL IMPLEMENTS of all kinds.

FIELD and GARDEN SEEDS, of various sorts, fresh home grown and imported.

THE AMERICAN AGRICULTURIST—weekly, \$1 per volume—two volumes a year.

For sale at R. L. ALLEN'S Agricultural Warehouse and seed Store, 189 and 191 Water street, New-York. 25-tf

ATKINS' SELF-RAKING REAPER.—40 of these machines were used last harvest in grass or grain or both, with almost uniform success, in nine different States and Canada. TWENTY-SIX PREMIUMS, including two at the Crystal Palace, (silver and bronze medals,) were awarded it at the autumn exhibitions. I am building only 300, which are being rapidly ordered. Mr. Joseph Hall, Rochester, N. Y., will also build a few. Early orders necessary to insure a reaper.

Price at Chicago \$175-\$75 Cash with order, note for \$50, payable when reaper works successfully, and another for \$50, payable 1st December next with interest. Or \$160 cash in advance. Warranted to be a good Self-Raking Reaper.

Agents properly recommended, wanted throughout the country. Experienced agents preferred. It is important this year to have the machines widely scattered.

Descriptive circulars with cuts, and giving impartially the difficulties as well as successes of the reaper, mailed to post-paid applications. S. WRIGHT.

"Prairie Farmer" Warehouses, Chicago, Feb., 1854. 23 35

GARDENER FOR THE GREEN-HOUSE AND GRAPE-HOUSE.—Wanted a Gardener as above, who is experienced in the management of the Green and Grape-House in the United States. None need apply except fully qualified. 22-tf

GARDEN IMPLEMENTS.

HEDGE, LONG-HANDLE AND SLIDING PRUNING SHEARS; Budding and Edging Knives; Earning Hatchets, saws and knives; pruning, vine and flower scissors; Bill and Milton hoes; lawn and garden rakes; garden scufflers, hoes of great variety, shovels and spades; hand engines, which throw water forty feet or more, syringes and water pots; grafting chisels, tree scrapers, and caterpillar brushes; transplanting trowels, reels; hand plow and cultivator, very useful to work between rows of vegetables, together with a large assortment of other implements too numerous to mention. (21tf) R. L. ALLEN, 187 and 191 Water-st.

FOR SALE AT THE SOUTH NORWALK NURSERY, THE Great New Rochelle or Lawton Blackberry Plants; also plants of the White fruited Blackberry. For sale also a large stock of small plants of the new or North River Red Antwerp plants, at the low price of fifteen dollars per thousand. The above plants all warranted.

24-36

GEO. SEYMOUR & CO.,
South Norwalk Nursery, Conn.

POUDRETTE.

THE LODI MANUFACTURING COMPANY OFFER their Poudrette for sale in lots to suit purchasers, from a single barrel up to 4000 barrels, at their usual rates, \$1.50 per barrel for any quantity over seven barrels, delivered on board of vessel in the city of N. York, free of cartage or other charge. When 2000 or 3000 barrels are taken, a deduction will be made from the above price. That this article has stood the test of fourteen years trial is proof of its efficacy. It is the cheapest and best manure for corn ever produced, and it has the advantage of being useful in small quantities and harmless in large. It is a capital manure for peas, strawberries, &c., and all garden vegetables. Apply by letter or personally to the Lodi Manufacturing Company.

22-34

74 Cortlandt st., New-York.

AGRICULTURAL IMPLEMENTS.

AGRICULTURAL IMPLEMENTS.—THE SUBSCRIBER keeps constantly on hand, and offers for sale the following valuable implements:

Fan Mills of various kinds, for rice as well as wheat, rye, &c. Grain Drills, a machine which every large grain planter should possess. They are of the best patterns, embracing most valuable improvements.

Smut Machines, Pilkington's, the most approved for general use.

Hay and Cotton Presses—Bullock's progressive power-press, combining improvements which make them by far the best in use.

Grain mills, corn and cob crushers, a very large assortment of the best and latest improved kinds.

Horse Powers of all kinds, guaranteed the best in the United States. These embrace—1st, The Chain Power, of my own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, and economy. They are universally approved wherever they have been tried. 2d, The Bogardus power, for one to four horses. These are compact, and wholly of iron, and adapted to all kinds of work. 3d, Eddy's Circular Wrought Iron Power, large cog-wheels, one to six horses, a new and favorite power. 4th, Trimble's Iron-Sweep Power, for one to four horses. 5th, Warren's Iron-Sweep Power, for one or two horses.

GRAIN MILLS, STEEL AND CAST IRON MILLS, AT \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES.—FOR MAKING DRAINING TILES OF all descriptions and sizes.

WATER RAMS, SUCTION, FORCE, AND ENDLESS-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL KINDS, MADE EXPRESSLY for the California and Oregon Markets.

DRAINING TILES OF ALL FORMS AND SIZES.

CLOVER AND TIMOTHY SEED HARVESTER.—A newly-patented machine, will harvest 10 or 12 acres per day with 6th horse.

HAY AND COTTON PRESSES.—BULLOCK'S PROGRESSIVE POWER-Presses, combining improvements which make them by far the best in use.

THRESHERS AND FANNING-MILLS COMBINED.—OF Three Sizes and Prices, requiring from two to eight horses to drive them, with corresponding horse powers. These are the latest improved patterns in the United States.

SOUTHERN PLOWS.—Nos. 10 1/4, 11 1/4, 12 1/2, 14, 15, 18, 19, 19 1/2, 20, A 1, A 2, 50, 60, and all other sizes.

CORN-SHELLERS, HAY, STRAW, AND STALK CUTTERS, Fanning-Mills, &c., of all sizes.

1-tf

R. L. ALLEN, 189 and 191 Water street.

FERTILIZERS.

PERUVIAN GUANO.—First quality of Fresh Peruvian Guano, just received in store.

R. L. ALLEN, 189 and 191 Water st., N.Y.

SUPERPHOSPHATE OF LIME, OR CHEMICAL MANURE.—100 tons Paterson's Improved, skillfully made of the best materials, and for sale at lowest rates, by HASKELL, MERRICK & BULL, Importers of Artificial Manures, Wholesale Agents for the Manufacturer, No. 10 Gold street. 1-31

HORSE MARKETS.

BULL'S HEAD SALE AND EXCHANGE STABLES, TWENTY-FOURTH STREET, West side of Third Avenue, N. Y. 1-34

A. S. CHAMBERLIN, Proprietor.

FAGAN & GRAHAM, SALE AND EXCHANGE STABLES, cor. of Lexington Ave. and Twenty-fourth street, New-York.—F. & G. have at all times on hand the most select stock of Messenger and Abdalla horses, together with good draught horses. Horses at livery by the day, week, and month. 1-38

HAIR RESTORERS, &c.

BARKER'S CHEVEUXTONIQUE.—THIS IS AN ENTIRELY new article, concocted for the purpose of Preserving, Restoring, and Beautifying the Hair, and, unlike most preparations designed for the same objects, it is free from all grease, so that its application cannot soil the most delicate fabric. As an eradiator of Dandruff, it is unequalled, while its infallibility in cases of headache, easing the most violent in a few moments, cannot fail to commend it to universal appreciation. The Cheveux-tonique is for sale by all the respectable druggists and fancy stores throughout the city. The depot for its sale, wholesale and retail, is at BARKER'S Ladies' Hair-dressing Establishment, No. 439 Broadway. 2 48

HORTICULTURAL.

FRUIT AND ORNAMENTAL TREES AND PLANTS.—Including everything necessary to the Garden, Green-house, Nursery, and Orchard, with all the recent introductions, at very low rates. Descriptive price Catalogues gratis. Carriage paid to New-York. Ornamental and other planting done in any part of the country. The best season for transplanting is after Oct. 10. Address B. M. WATSON, Old Colony Nurseries, Plymouth, Mass. 8-39

WACHUSETT GARDEN AND NURSERIES,

NEW-BEDFORD, MASS., ANTHONY & MCAFEE, PRO PRIETORS, Successors to Henry H. Crapo, would invite the attention of the public to their extensive stock of Fruit and Ornamental Trees, Flowering Shrubs, Rose Bushes, &c., Evergreens, Balsam Firs, American and Chinese Arbor Vitae, Cedrus Deodara, Cryptomeria Japonica, Norway Spruce, Yew Trees, Tree Box, &c., an extensive assortment of Apple, Pear, Plum, Cherry, Peach and Apricot Trees.

The stock of Pear Trees is very large, both on Pear and Portugal Quince Stocks, embracing every thing worthy of cultivation. All our Pear Trees are propagated and grown by ourselves, and

WARRANTED TRUE TO NAME.

The soil, climate, &c., of this locality being so favorable to the Pear, our trees are unrivalled for HEALTH, vigor of growth, &c., &c.

They are all free from that destructive malady THE PEAR BLIGHT, which has never existed in this locality.

Prices low, and a liberal discount to the trade.

New-Bedford, Jan. 1st, 1854.

17-68

HOUSE-FURNISHING.

New-Orleans, A. Robb, 2-43

MISCELLANEOUS.

RANGES AND HEATERS.—I AM NOW PREPARED TO supply those in want of a Cooking Range with one that is not only economical, but combines more conveniences for boiling, baking, &c., than any other in use. Also, the Etna Heater, for warming houses of any size. Apply to

A. McPHERSON, No. 233 1/2 Water street.

2-40

FISH HOOKS AND FISHING TACKLE, NEEDLES, &c.—HENRY WILSHIER, Manufacturer and Importer of Needles, Fish-hooks and Fishing-tackle, consisting of Limerick and Kirby salmon, trout, bass, pike, perch and other Hooks; Salmon, Lake, and Trout Flies; Cork and Wood Floats; Flax, Twisted and Plaited Silk, Chinese Grass Hair, and Cable-laid Lines; Bowed, Swivel, Hollow, and Plain Sinkers; Flax and Silk Lines ready for use; Silk-worm Gut; Smells; Double-Twist and Single Gut Leaders; Spoon Bait; Squids; Multiplying and Plain Reels, Nets, Artificial Fish; Walking-cane and other Rods; Lolley's and Chambers' Sail Needles; Pack and Willsher's superior Sharps and Between Needles, &c. Cheap for cash, in lots to suit purchasers, at No. 9 Cedar street, New-York. N. B.—Orders per mail or otherwise promptly attended to. 2-40

WHOLESALE FISH STORE.—500 BBL'S SALMON, 2000 lbs. Mackerel, first quality, 300 Small Packaged Mackerel, 200 bbl's New Shad, 500 half Shad, 1000 bbl's New Herring, 300 half New Herring, 1000 quintals New-Dried Cod-fish, 500 Jars New Anchovies, 500 Kegs New Dutch Herring, 2000 Boxes New Smoked Herring, 3000 lbs. New Smoked Salmon, 500 Kitts New Soused Salmon, 500 Kegs New Spiced Herring, Sword-Fish, Blue-Fish, Pickled Cod, Haddock, Halibut, White-Fish, Sturgeon, Trout, Dun-Fish, &c.

For sale by NELSON WELLS & CO., 81 Dey street, between Washington and West, May 13th, 1852. 1-52

NELSON WELLS, S. H. WOOD.

SEEDS.—TIMOTHY; RED AND WHITE CLOVER; BLUE Grass; Orchard Grass; Bay Grass; Red Top; Sugar Corn; Peas; Beans; Turnip; Cabbage; Beet; Lettuce; Onions; Radish; Squash; Osage Orange; Large Yellow Locust, and all other kinds of field and garden seeds. Also Rhubarb Roots; Asparagus Plants, &c. and 191 Water street.

STOCK.

IMPROVED STOCK OF ALL KINDS.—HAVING HAD great experience in breeding and rearing fine stock for the past twenty years, I offer my services to my friends to procure it of the best and most reliable kinds. As much notice as convenient is at all times desirable previous to purchasing, as it takes time to make good selections. Early in August or September is the best time to purchase for the South.

Short Horn or Durham cattle, Devons, Herefords, Alderney or Jersey and Ayrshires. Long-wooled Sheep—the Cotswold, Oxford, Leicester, Bakewell, and Lincoln. Mutton Sheep—the Southdown. Fine-wooled Sheep—such as the Saxon, Spanish, and French Merino.

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, which are spurious.

1-tf A. B. ALLEN, Nos. 189 and 191 Water street.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master, and ask him to mark the envelope, Registered by —, P. M.

BACK NUMBERS are usually kept on hand, and when a subscription is sent without naming any date for commencing, the back numbers from the beginning of the current volume will be sent, unless as sometimes happens, an unusual rush of subscribers has exhausted the supply.

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In writing, always give the Post-office (instead of the town) and the County and State. Write these very plainly.

Clubs may add to their number at the same rate per copy as was paid by the original members.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished with Harper's Magazine, one year for	\$4 00
" Putnam's do do	4 00
" Knickerbocker do	4 00
" Eclectic do do	6 00
" Littell's Living Age do	6 50
" National Magazine do	3 50
" Dickens's Household Words	3 50

Address ALLEN & CO.,
189 Water street, New-York.

J. A. GRAY, Printer, 95 and 97 Cliff street, N. Y.

PUBLISHERS' ANNOUNCEMENT!

Twelfth Volume of

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B. The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon its own merits; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammeled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDN, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers,	-	-	-	\$2.00 a year,	\$2.00
" Clubs of 3 do.	-	-	-	1.67 "	5.00
" do. 5 do.	-	-	-	1.60 "	8.00
" do. 10 do.	-	-	-	1.50 "	15.00
" do. 20 do.	-	-	-	1.25 "	25.00

The money always to accompany the names for which the paper is ordered.

The Post-Master, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Post-Master, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, *Weekly Tribune*, or *Weekly Times*, or any other paper or periodical in this city, not costing to exceed two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if enclosed and mailed in the presence of the Post-Master.

Communications for the paper should be addressed to the Editors; subscriptions, advertisements, and all matters relating to the business department, should be addressed to the Publishers,

FOR PROSPECTUS, TERMS, &c.,

SEE LAST PAGE.

FLAX AND ITS SEED—A NEW VARIETY.

It is a subject of regret that the manufacture of flax makes such slow progress in the United States. In the Western States—Ohio, Indiana, and Illinois, particularly, thousands of tons of the lint on the stalks are annually thrown away, and lie rotting in heaps in the fields, for the want—as the people who raise it tell us—of a proper machine for dressing it. At our State Cattle Show at Rochester, in 1851, we think, a machine was exhibited by a gentleman from some part of New-England, the principles of which were approved by those who examined it and its mode of operation. Since then we have neither seen nor heard of it. If it really be the thing required, its owner could make it an object to go into the flax-dressing business in Indiana and Illinois. Flax is there raised for the seed only, in making oil, and for exportation.

On passing a store in Dayton, Ohio, a short time since, our attention was arrested at seeing a pail of *yellow* flax seed sitting in the door, with a placard, and the words “for loaning,” written upon it. Stepping in, we inquired of the proprietor what that meant? He answered that it was a new kind of seed, recently discovered, and that those who had obtained it, were desirous of its further cultivation, and by this method of disposing of it, many farmers took small quantities, sowed it carefully, and returned a share of the crop. On examination, the seed was plump, fair, of usual size, and exactly the color of Canary seed, or straw-colored-drab. It was found, as we learned, near Urbana, Ohio, a few years since, by the owner of a field of flax—a single stalk, bearing a *white* flower, in the midst of the other flax. He marked this stalk, and when ripe, picked it, and sowed the seeds the next year. It has multiplied, until now there are many bushels of it—not for sale, but “loaning,” as at Dayton. We again heard of it in that neighborhood. What this new flax is to prove, whether any thing more than a variety, and that simply in the color of the seed, is yet to be known.

With the lint devoted to its proper use by the aid of a competent machine for dressing it, few crops grown at the West can be more remunerating than flax. It can, in proper alternations with other crops, be grown to an enormous extent in the fertile lands of the West. It is not there considered an exhausting crop; it cleans the land of weeds. After the crushed seed is exhausted of its oil, the cake is worth

an equal weight of Indian corn meal for feeding cattle; thus yielding two distinct and valuable products to the arts, and serving the producer the wherewithal to feed his stock, and a return, if need be, of much of the proper aliment to the soil for its reproduction.

THE TERRIER DOG.

In regard to dogs in general, we believe there are ten kept in the United States where one is needful; and as we pass through the country, and see the common race of villainous curs that haunt nearly every farm-house, and run yelping out from every dirty tenement in the villages, we almost wish that the whole race were extinct. As usually kept throughout our farming districts, dogs are an unmitigated nuisance. They are, among their own race, what alligator hogs and the common sheep are among farm stock—worse than nothing. But as we suppose that every man owning a farm or occupying one, will keep his dog, if not several, we feel disposed to instruct him, if he will listen to instruction, as to what sort of dog will do him some service.

A well-bred rat-terrier is a valuable creature on a farm. There are several varieties, the Isle of Skye terrier, with soft, long silky hair; the Scotch, with rough, long, wiry hair of almost every shade of color; the London terrier, usually black-and-tan in color, others white, sometimes spotted, tan-and-white; and the bull terrier. This last we have seen of all colors and sizes, above twenty pounds weight; but as they are a cross, more or less, with the bulldog, there is little truth or reliability in their breeding; and are not desirable for the purposes usually required of the others. The truly useful work of the terrier is that of destroying the vermin on the farm, and guarding the premises from intrusion at night. For these purposes, either the Scotch or London terrier is better than any other dog we have known. Always wakeful and vigilant, unappeasable at the voice, or the step of a stranger at night, they give warning of his approach, and will only cease their attacks at the command of some of the household. To be complete as a farm-dog, a terrier should be thorough-bred, of either the rough or smooth variety, and weigh from 20 to 30 pounds. Twenty pounds is the lightest, and thirty the heaviest weight that should be selected. Dogs lighter than twenty are not heavy enough to encounter large rats, minks, or weasels with sufficient dexterity, while those of 25 to 30 pounds are generally more active in their work, and do it up more effectually. We once had an 18 pound dog—a capital ratter he was, too. We also had one of 28 pounds, and they

always worked together on the farm. In hunting their game, the small one would frequently get bitten by a large rat, mink, or weasel, and sometimes so severely as to lose his hold, when he would be cautious, and sometimes hesitate about attacking a second time. But no such difficulty occurred with the other. A single grip of the jaws, and the work was done, scarcely ever losing his hold, or making a false move. One would hardly suppose that so diminutive a creature as a weasel, rat, or mink, would hold combat with a dog; but we have seen a twelve pound dog worsted by them—they bite so sharp. So, if one is to have a dog at all, better have an efficient one.

There were several high bred terriers, both Scotch and London, shown at the late poultry exhibitions at Albany and New-York. But they were nearly all too small, weighing twelve to eighteen pounds, and delicate at that. Such dogs are too light-limbed for strength; and although active, and good enough for field mice, a stout old rat, mink, or weasel is sometimes too much for them, particularly if they fasten their teeth into the dog, which they always do about the faces or lips. We have known the dog thus bit to cry out, let go his hold, and back out altogether, rather than renew the attack. We know that some of these diminutive dogs are sometimes backed for killing rats on a wager. But this is when the rats are caught and thrown into a pit already prepared, where they are already subdued by fear, and will not resist, trying only to get away—a very different thing from taking them in their own haunts, where they frequently return the fight with great dexterity. In the latter event, a strong, active, and courageous dog is the only thing to be depended on; and we would advise those breeding terriers not to make their standard of size less than twenty pounds in weight; and twenty-five to thirty is still better. These larger terriers, also, are good coon hunters. We have one of 28 pounds weight that will attack and kill the largest coon in the woods; while the smaller dogs will soon get the worst of it in a close fight. Terrier breeders will do well to look closely to the selection of the sires they use, and see that they are perfectly sound and in good health. As in all other kinds of animals, it is important to keep up the constitution and stamina of their stock; and dogs, from their violent exercise, and the frequent accidents which occur to them, are more apt to be defective getters than any other creatures we keep.

GREAT FRENCH CATTLE SHOW.—This came off a few weeks since at Poissy, about twenty miles from Paris. The stock exhibited is said to have been more numerous than last year, and

were made up of cattle, sheep, swine, &c. The Director General of Agriculture presided, and gave the Society an excellent address.

For the American Agriculturist.

CULTIVATION OF THE OSAGE ORANGE FOR A HEDGE.

In the first place, it is important to procure genuine and sound seed. The seeds of the Osage Orange are enveloped singly in the tough and fibrous substance composing the fruit or ball. Extracting the seed without injuring their vitality is a slow and tedious process. In order to do it with greater facility, many unprincipled persons have resorted to scalding, or to a high fermenting process, which entirely destroys the germinating principle of the seed.

The seed of the Osage Orange requires a high temperature to induce vegetation, and hence they should not be planted until the warm weather of spring is established, say about the first to the tenth of May. About two weeks before planting, the seeds should be put in soak and remain in the water for three days. Not more than two quarts should be put in the same vessel. Turn the water off and cover the seed with a cloth, and place them in a warm room, and stir them daily. They should be kept sufficiently moist to induce vegetation. Should the weather prove favorable, the vessels containing the seed may be plunged into a hot-bed, where they will sprout more speedily. As soon as the germ begins to appear, they should be planted.

The ground selected for the seed beds should be rich, and should be plowed deep and thoroughly pulverized and finely raked. Lay the ground off in drills one inch deep, wide enough to admit the passage of the cultivator. The seeds should be dropped about half an inch apart in the rows, and they should be covered by drawing the fine earth from each side with both hands, forming a ridge one inch high. In six or eight days, if the season be favorable, the young plants will begin to break the ground. The ridge should then be removed with a fine rake. This method leaves the row clean and mellow, and gives the young plants a good start of the weeds, and greatly lessens the labor of the first hoeing. The plants should be well cultivated throughout the season.

The hedge row should be plowed at least ten or twelve inches deep and eight or ten feet wide, in the fall; or, if the land is new, it would be well to cultivate a crop of corn or potatoes on it the year previous. If poor ridges occur in the row, they should be well trenched and manured, to insure uniformity in the growth of the hedge.

In the spring, just previous to setting the plants, the row should again be plowed and well harrowed. The plants may be lifted from the seed beds with facility by two persons with spades, one on each side of the row; care should be taken not to mutilate the roots. Shorten the roots to about eight or nine inches in length, and the tops to within one inch of the root.

Stretch a line where the hedge is to stand. Assort the plants, and set those of uniform size together. In setting the plants, run a long spade perpendicularly by the line to the depth of the root, making an opening *without removing the earth*; withdraw the spade, and insert the plant full as low as it grew in the seed bed. Press the earth to the root by entering the spade again just back of the plant, pressing the earth forward. Set the plants in this manner, about ten or twelve inches apart, according to the strength of the soil, in a single row. After setting, the ground should be firmly trod on each side of the plants and again leveled off. In order to secure the advantage of the requisite light and a free circulation of air, and to leave room for thorough cultivation, the hedge should never be planted within six or eight feet of any fence. The row should be kept free from weeds and be thoroughly cultivated during the season.

One great error has been committed by nine-tenths of the persons who have attempted to grow the Osage hedge, and that is, they have been too impatient to complete the hedge before they had secured a foundation on which to base it. A hedge sufficiently firm and compact at the bottom, *cannot be grown without severe and repeated cutting back*, in order to insure strength to the lower and lateral branches. This must neither be neglected nor delayed beyond the proper time, or all the previous labor will be lost. The season the plants are set in the row they will require no regular pruning, but, should any of the plants assume a too vigorous upright growth, they should be checked by cropping their tops with a long knife. This can be done as fast as a man can walk. The spring after the plants have been set, they should be cut off to within three or four inches of the ground. In consequence of cutting off the tops at the time of setting, each plant has produced three or four shoots. The second cutting will cause them to multiply to six or eight, nearly filling the space between the plants.

Cultivation must be continued the second year as before. About the middle of June, or when the plants appear to be making the most vigorous growth, they must be again shortened back to within three or four inches of the last cutting. In order to give size and strength to the lateral branches, and secure a close and compact base to the hedge, these summer prunings must not be delayed. Continue to repeat the spring and summer prunings until the fourth or fifth year, cutting off the side and bottom branches so as to form the hedge about three feet wide at the bottom, gradually narrowing toward the top, to about four or five feet in height, when it will be sufficiently formidable to turn any stock upon the farm, and so close at the bottom as to render it difficult for a rabbit to pass through it. The experience of the hedger by this time must suggest the subsequent treatment.

For trimming the hedge, a common hemp hook with a long handle and the hedging shears, will be found the most convenient implements.

Where blanks occur in the hedge row, (which need not be the case if proper care is taken in assorting and setting the plants,) it is better to fill up the spaces with good-sized plants than to attempt to remedy the aspect by laying down the shoots of the neighboring plants.

For the American Agriculturist.

HOVEN IN CATTLE.

In your note to my communication on Hoven in Cattle, you speak of losing one of yours several years since by it, and rather doubt the efficacy of *white-wash* as a remedy. It will be seen that I advise the use of the white-wash as soon as the animal is found to be hoven, and that it might otherwise fail. But on my first trial with white-wash, the cow had been hoven two days before the white-wash was given, and many of the usual remedies had failed.

In the case you speak of, while the cow was not sufficiently hoven to be suffocated or ruptured, yet an inflammation was produced, which, with a return of the natural animal heat, stopped the generation of carbonic acid gas, but at the same time started another fermentation in the corn and stalks, by which all the juices were vaporized and carried off by perspiration, leaving the contents in the state which you found them—dry. I think, however, that had your cow had sufficient lime water to drink during the first thirty-six hours that she was suffering, she would have got over the hoven.

J. H. D.

Morristown, N. J.

FRUIT.—The *Delaware State Journal* says much anxiety is felt for the peach crop, as the trees were in full bloom when the late snow storm was experienced. The most reliable ac-

counts from Ohio represent the peach and apple crop as unharmed.

BARN-YARD BUILDINGS.

WE cut the following excellent article from the *Soil of the South*, for it is as applicable to many parts of the north and west as to that region. The remarks on the restlessness of landholders, and their constant disposition to emigrate, are well timed, and we hope they will command attention. Our people, especially along the frontiers, are entirely too nomadic in their dispositions and habits to make much progress in agriculture, or indeed in any thing else.

No feature in our plantation economy, tends more to depreciate the respectability of our profession, than the style of our barn-yard improvements. Not one planter in a hundred has a house which can be dignified with the name of a barn. The common arrangement is a rail-pen for corn, a rail-pen for shucks, fodder and oats in stacks. The evils attending this custom are numerous. It is at once the creature and the creator of that spirit of restlessness and emigration which characterizes the whole planting fraternity. We do not make better improvements because we do not feel settled, and we do not feel settled because we do not make better improvements. Almost any sort of a contrivance will do for a few years, and we conclude, correctly, that a rail-pen will last until we can wear out our lands. Let us build permanent improvements and they will constitute an additional incentive to improved culture of our lands. There is no surer means of settling a man, than for him to spend his time and occupy his mind in the improvement of his estate. Every house he builds, every ditch he digs, every tree he plants, are but so many ties to bind him to his home. In other words, by just as much as he improves his place, by just so much does he add to its attractions; by just so much does he increase the disparity between what he has and what he can get on a new place. A planter who improves his plantation, invests in it, not only his money, but his thoughts, his tastes, and his affections. The first advantage, therefore, to be derived from making improvements is, that it will correct, to a large extent, that spirit of emigration among the planting community which has almost depopulated some of the best agricultural districts of the South.

Another consideration, and one which may probably appeal more successfully, is, that we will make more money by making permanent improvements; first, because when they are once made, they are made for good, and secondly, because they save from actual loss, more than enough to pay the cost of their construction. A properly constructed barn will last for several generations, and, on a plantation of twenty-five hands, it will save enough in three years to pay for it. Nobody but one who has tried it, can estimate the amount of corn and shucks, and fodder and oats which are actually destroyed by negligence in our ordinary barn-yard arrangements. There is enough shattered corn and rotten fodder and oats on a common-sized Southern plantation, to sustain a respectable Yankee establishment. A Massachusetts farmer would not ask a better living than the loss about a Georgia planter's barn-yard. With the privilege of picking up our leavings, he could afford to pay one hundred dollars per acre for the environs of our horse lot, and make more clear money than we do with an investment of ten dollars per acre in our cotton fields.

In the construction of barns especial reference should be had to convenience. In this respect, we are an age behind our Northern friends, not only in our farm-yard, but in our residences. I prefer to have every thing in the barn-yard, as far as practicable, under the same shelter. It is objected to this plan, that it is risking too much by fire to connect so many things under

one roof. There is no force in the objection, because there is no reason why any barn-yard buildings should ever be burned, as we never have occasion for fire about them. At any rate, this consideration is of too little weight to balance the numerous conveniences of this arrangement.

The building should contain a mule shelter, a corn crib, a fodder and oat loft, a cutting room, and a harness room. The mule shelter should be sufficiently large to afford abundance of room for each mule, and should be divided into stalls or not, as suited the notions of the planter. I prefer a stall 10 by 7 for every mule. The corn-crib, fodder loft, and the cutting-room should all be so arranged as to connect with the mule stable without the necessity of leaving the roof, in order to prevent unnecessary exposure in wet weather. Care should also be had in the construction of the house, for making manure, and also for hauling it out easily.

I have given these general suggestions, rather than send a drawing of some particular plan, as almost every one has some fancy to gratify in the construction of a barn.

LEAVES FROM MY CHINESE NOTE BOOK.

Chinese Indigo—a new kind discovered.—Those who read my "Wanderings in China," may remember the account I gave of a valuable kind of indigo made from a species of wood (*Isatis indigotica*) which is extensively cultivated in the level country, a few miles to the westward of Shanghai; I have now to notice another kind, equally valuable, if not more so, which is made from a species of *Justicia*, or from a plant of that natural order to which *Justicia* belongs. This kind is largely cultivated in the hilly country near Ningpo, or rather in the valleys amongst the hills. It seems to be easily cultivated—it grows most luxuriantly, and is no doubt very productive. Having evidently been introduced from a more southern latitude, it is not hardy in the province of Chekiang, any more than cotton is about Shanghai; but nevertheless it succeeds admirably as a summer crop. It is planted in the end of April or the beginning of May, after the spring frosts are over, and it is cleared from the ground in October. During this period it attains a height of a foot or a foot and a half, becomes very bushy, and is densely covered with large green leaves. It is cut before any flowers are formed. The Chinese method of preserving plants for next year's crop is most ingenious and well worth notice. I have already remarked that it is a tender plant, and consequently the roots left in the ground after the gathering season, are all destroyed by the first frosts of winter. But the Chinese do not depend upon these for the next year's crop; nor do they take them up, or cover them in any way, but simply leave them to their fate, after having done their duty for one year. Cuttings are found to be much more vigorous and productive than the old roots, and to the preservation of cuttings the Chinese cultivator directs his attention. When the stems are cut for the manufacture of indigo, a large quantity of them have their leaves stripped off, and are afterwards taken into a house or shed to be properly prepared. The leaves thus stripped from the cuttings are thrown into the tanks with the other stems and leaves, so that nothing is lost except what is actually required for the purpose of propagation. The stems are now tied up firmly in large bundles, each containing upwards of 1000, and the ends of each bundle are cut across, so as to leave them perfectly neat and even, both at top and bottom. These bundles are each about a foot long, and, of course, nearly round. Having been thus prepared, they are carried to a dry shed or out-house, where in some snug corner, they are packed closely and firmly together, and banked round with very dry loam. A portion of the dry soil is also shaken in between the bundles; and this being done, the operation is complete.

Should the winter prove usually severe, a little dry straw or litter is thrown over the surface of the cuttings, but nothing else is required. During the winter months, the cuttings remain green and plump; and, although no leaves are produced, a few roots are generally found formed, or in the act of forming, when the winter has passed, and the season for planting has come round. In this state they are taken to the fields and planted. The weather during the planting season is generally showery, as this happens about the change of the monsoon, when the air is charged with moisture. A few days of this warm showery weather is sufficient to establish the new crop, which now goes on growing with luxuriance, and requires little attention during the summer—indeed none, except keeping the land free from weeds. In the country where this dye is grown, there are numerous pits or tanks on the edges of the fields. They are usually circular in form; and one which I measured was 11 feet in diameter, and 2 feet in depth. About 400 catties of stems and leaves are thrown into a tank of this size, which is then filled to the brim with clear water. In five days the plant is partially decomposed, and the water has become lightish-green in color.

At this period the whole of the stems and leaves are removed from the tank with a flat-headed broom made of Bamboo twigs, an admirable instrument for the purpose. When every particle has been removed, the workmen employed give the water a circular and rapid motion with the brooms just noticed, which is continued for some time. During this part of the operation, another man has employed himself in mixing about 30 catties of lime with water, which water has been taken out of the tank for the purpose. This is now thrown into the tank, and the rapid circular motion of the water is kept up for a few minutes longer. When the lime and water have been well mixed in this way the circular motion is allowed to cease. Four men now station themselves round the tank and commence beating the water with bamboo rakes made for this purpose—the beating process is a very gentle one. As it goes on the water gradually changes from a greenish hue to a dingy yellow, while the froth becomes of a beautiful bright blue. During the process the head workman takes a pailful of the liquid out of the tank and beats it rapidly with his hand. Under this operation it changes color at once, and its value is judged of by the hue it presents. The beating process generally lasts for about half an hour. At the end of this time the whole of the surface of the tank is covered with a thick coating of froth of the most brilliant colors, in which blue predominates, particularly near the edges. At this stage, it being desirable to incorporate the froth with the liquid below it, I witnessed a most beautiful chemical operation which took me completely by surprise, and showed how universally must be the knowledge of the effect of throwing "oil upon the waters." A very small portion of cabbage-oil—only a few drops—was thrown on the surface of the froth, the workmen then stirred and beat it gently with their flat brooms for a second or two and the whole disappeared as if by some enchanter's wand. And so small a quantity of oil was necessary for this purpose that even when the cup had been emptied, and had only the oil that was necessarily adhering to its edges, it was thrown into another tank, and produced the desired effect. The liquid, which is now darker in color, is allowed to stand quiet for some hours, until the coloring matter has sunk to the lower stratum, when about two-thirds of the surface is drawn off and thrown away. The remaining third part is then drawn into a small square tank on a lower level, which is thatched over with straw, and here it remains for three or four days. By this time the coloring matter has separated itself from the water, which is now entirely drained off—the dye occupying 3 or 4 inches of the bottom in the form of a thick paste, and of a beautiful blue color. In this state it is packed in baskets and exposed for sale in all the country towns in this

part of China. What its intrinsic value may be when compared with the indigo of commerce, I have no means of ascertaining, but it is largely used in this part of the world, where blue is the most fashionable color, judging from the dresses of the people. And it is possible that with our knowledge a color of this kind might be greatly improved. After being grown and manufactured as I have described, it is sold at rates varying from 50 to 100 cash a catty, say from 2d. to 4d. per lb. Some is sold as low as 30 cash, but this is very inferior; the greater part produced is sold from 60 to 80 cash a catty, and it must be of a very superior quality if 100 cash is paid. Like the Shanghai Indigo made from *Isatis indigotica*, it is called "Lien-ching" by the Chinese. I have just sent a large supply of the cuttings above described to the Agricultural and Horticultural Society of India, and hope the plant may prove of some value in a country where the indigo of commerce is largely cultivated.—R. F., in *Gardeners' Chronicle*.

A NEW AND BEAUTIFUL TREE IN OREGON.

Mr. Brooks, a respectable farmer of Olympia, Oregon, writes to a friend in Boston a very interesting account of a strange and beautiful tree lately discovered in that country. It was communicated to the *Journal of Agriculture*, from which we take the following extract:

A strange and beautiful tree has been discovered in Washington Territory, which is not known to exist in any other part of the habitable globe. The tree is destined, I think, to make some noise in the world. It is remarkable, because its like is not found elsewhere, and on account of its great beauty and fragrance. The tree varies in height from one to seven feet. The leaf resembles that of the pear; while the trunk and branches look like those of an orange tree. The upper side of the leaf is coated with gum, having the appearance of oil, and of the consistence of honey. Handling them, causes the gum to adhere slightly to the fingers. The gum, as well as the leaf and bark, is highly odorous. The fragrance, which is quite strong, resembles that of Bergamot, or ripe fruit, and a few leaves are sufficient to perfume a room. A leaf, fully wrapped up in paper, so as to be entirely concealed, was handed to several persons, with a request that they would tell by the smell what it was. All expressed themselves highly delighted with its fragrance, but gave different answers as to its character. Some said it smelled like ripe pears; some that it was Bergamot; whilst others thought it smelled like ripe apples. The flower resembles that of the white Jessamine.

This will certainly make a very beautiful and desirable ornamental tree, to grow in our gardens, around our dwellings, near the parlor-windows, or to form a choice bowser. Its intrinsic value for these purposes is greatly enhanced by the consideration that it is an *Evergreen*. This specimen is brought from my farm, and is taken from a grove of about a quarter of an acre. The plant is very rare even here, the oldest settlers of the country say they never saw it growing elsewhere. Still I have no doubt it will be found in other places. It has been known to the priests of the Catholic Mission of St. Joseph for some years, but has not attracted attention until recently.

TALLOW, TALLOW.—There is now apparently a fine field about to be opened for the sale of any extra tallow that our tallow dealers may have on hand, or our farmers be able to raise during the war between Britain and Russia. In 1852 no less than 64,578½ tons were imported from the latter country, by the former. All this supply will now be cut off, and the soap and candle makers of England will have to look about them for supplies from some other quarters.—*Scientific American*.

WOOD PAPER.

In the making of books there is said to be no end; their rapid increase during the last few years, has led to the discovery that the cotton and linen rags of the world are altogether insufficient to meet even the present demand—the daily press of our large cities alone would almost exhaust them. One of our city dailies, we see, demands for its ordinary use, nearly twice as much paper as the whole of the immense annual issues of the American Tract Society. Under such circumstance, the following article from the *London Gardeners' Chronicle*, contains suggestions at once timely and important for American readers.

The small market value of **SOFT-WOODED TREES** is such as to render them scarcely worth attention among planters, except under very peculiar circumstances. When Willows, or Limes, or Poplars, or Sycamores, or any such species are felled, they are in so little demand, that after a small quantity of the best has been taken for the turner, toymen, or butcher, the rest may go as firewood. There is now, however, some prospect of their coming into consumption on a very large scale in an unexpected manner, for which, if anticipations are realized, we shall have to thank the Great Exhibition of 1851.

It appears that at a late meeting of the French Society for the Encouragement of National Industry, a paper was read explaining how such wood may be converted into paper. The bark is taken off, and the wood is reduced into shavings; the shavings are then cut very thin; they are next placed in water for six or eight days, dried, and afterwards reduced to the finest powder possible by a corn-mill. This powder is mixed with rags, which serve to prepare the pulp of paper, and the ordinary operation of paper-making is proceeded with. All white woods, such as the Poplar, the Lime, and the Willow, are suitable for the purpose, but the discoverer ascribes a good deal of his success to the quality of the water he employed—that of the little river Doller, which runs near Mulhausen. For the first experiment he employed the wood of the Aspen. Specimens of the paper so obtained were laid before the meeting, but we are not informed of its quality.

No doubt can exist that wood may be made into paper, provided it can be reduced into threads or particles fine enough for the purpose. For what is Flax or Hemp except wood, whose fibres are readily separable? There is no difference between the wood of Hemp and of Willow, or other soft trees, than such as arises from the greater cohesiveness of the threads of the latter, or from greater toughness, which is not a difference of importance in paper-making, for the weakest wood in the world is stronger than cotton dress, now so largely used in all paper-mills. The only question is, can the cohesiveness of fibres be overcome, or does the substance produced by grinding into pulp, either when used alone or mixed with other pulp, present a material fit for paper? We apprehend that it does.

The Mulhausen experiment is reported to have been made with timber. Suppose that the newly cut branches of Poplars, Limes, and Willows had been macerated for a fortnight, cut into suitable lengths, and then put into a tearing (not grinding) mill, where they could be worked with water, we suspect that good pulp (or at least "half stuff") would have been obtained without a preliminary reduction of the wood into shavings, and an after process of grinding.

That the present enormous demand for paper will lead to the discovery of some new source of fibre is certain. In fact it has already resulted in the manufacture of paper from straw, both here and in the United States, and a very good article, though not of a high class, is thus

obtained. Our West Indian colonies indeed might keep our market amply supplied, with no small profit to themselves; but they do so little except cry for aid to **HERCULES**, and wring in despair their feeble hands, that we expect nothing from them unless the British Government will take taxes in kind, and allow the inhabitants to pay their imposts with trusses of dry Plantain stems; if indeed it should prove that West Indians would not also, in such an event, expect Government officers to reap and pack their Plantains for them.

It appears from a return just issued by the Board of Indian Revenue that, notwithstanding the excise duty on paper, the quantity of that substance manufactured in the United Kingdom has risen from 150,903,543 lbs. in 1851, to 177,633,009 lbs. in 1853, showing an increase of manufacture to the extent of nearly 27 millions of pounds weight in three years. In 1844, the gross receipt for paper duties amounted to 709,320 lbs., and in 1853 to 1,049,662 lbs.; showing an increase of about 340,000 lbs. in the course of nine years. But of that increase above 190,000 lbs. apply to the last five years, or about 38,000 lbs. a year, representing, we believe, an annual increase of raw material exceeding six millions of pounds weight.

Let us ask whence these six million pounds annually added to the wants of the paper market are to be supplied. Materials are already becoming scarce; the price of paper is rising, and must continue to advance unless an enormous quantity of matter convertible into paper is furnished to the manufacturers. The effect will be something much worse than even an excise duty; the cost of books, newspapers, and every thing else made of paper, must inevitably be enhanced, and a natural permanent tax upon knowledge, as it is the fashion to call the paper duties, will be added to whatever artificial tax the financial necessities of the country may call for.

The remedy probably lies at our doors; it is certainly within our reach. Fibrous plants not strong enough for linen, but amply sufficient for paper, may be brought into profitable cultivation; as, for instance, the Hemp Nettle, (*Urtica cannabina*), the Marsh Mallow, or even common Mallows, and the Hemp Mallow, (*Lavatera cannabina*), to all which our climate is perfectly adapted. In the meanwhile, without awaiting the issue of experiments with such plants, our paper makers and country gentlemen would do well to ascertain what can be made of their soft woods.

For the American Agriculturist.

WHY SHOULD WE COMPOST MANURE?

This is an important question to the farmer, and ought to be answered in accordance with the principles of science, or the unsuspecting will be misled. The first thing necessary to know is, what is manure composed of? I answer, mainly of various gases, intimately mixed with a small proportion of mineral ingredients.

This may not be readily assented to by some, but the facts in the case are these, all farm-yard manure, until composted, is made entirely from vegetables, and all vegetable substances, as soon as they reach a state of perfection, begin to decay. This decay may not show itself immediately, but still it is actually going on. The mellowing of an apple is just as much decomposition, as it is after it, in common phrase, begins to rot.

While this rotting process is going on, the substance is resolved into its original elements.

Unless manure is composted, there is nothing to absorb the escaping gases. It will decompose, and there is no preventing it, unless we exclude the air. Short manure should be composted to prevent its wasting. Another reason we should compost is to save the liquid manure, which, unless this is done, is nearly all lost, and by many competent to judge, it is considered equal to the solid droppings.

And least, it should be done to increase the quantity of manure. Manure, composted with twice its own bulk of swamp muck, in such a manner as to save the liquid droppings, will be found to be worth as much, if housed, as the same bulk of manure thrown into the yard without composting, as is the practice with many. If there are persons disposed to doubt any of the above statements, all I have to say is, give the thing an impartial trial and satisfy yourselves.

S. TENNEY.

E. Raymond, Cumb. Co., Me.

For the American Agriculturist.

DEEP PLOWING.

So much has already been said about deep plowing, that it may be thought superfluous to add any thing further. But it is a subject worthy of much thought, and articles will be written, and experiments made till the matter is settled beyond a question.

The little experience I have had, dates back only two years. At that time I went upon a farm that had been left in the hands and to the mercy of tenants, for about a dozen years, the owner having removed to a distance. During that time, as many who are observing of such matters would suppose, the tenants gave as little to the farm, both in work and manure, as possible, and took as much as they could (excepting stones) from it. The work on my first field was a trial. I had read all the agricultural papers I could get hold of for years before, and I wished to plow my ground deep. But the stones were so thick and firmly embedded, as to defy a novice in plowing, and the harrowing of course could not be done well. As a consequence, a resolution was formed that in after cultivation, no field should be cultivated till it was sufficiently clear of stone to be well plowed and harrowed. Now, that piece of ground, the crop of which did not pay for the labor that year, has a fine crop of growing rye, the ground having been plowed and pulverized to a good depth. All other fields in use are plowed deeper than they used to be, and better crops are raised.

I am aware that all soils cannot be treated alike. Some may be deepened at once to advantage; in some this must be done by degrees and carefully, while others for various reasons, cannot, with benefit, be deepened at all. I practised upon the system of plowing deeper by degrees, taking care that so much sub-soil should not be brought up as to detract from the value of the coming crop, and though so short a time has elapsed, it is plain to be seen that the land bears better crops than formerly, better last year than the year before, of my own growing, and the prospect is, for a still better the coming season.

A FARMER.

A HEN STORY.

MR. EDITOR:—I send you the following "Hen Story," which, if you think worthy, you may insert in your paper.

On the 1st of Jan., 1853, I commenced with 24 hens; on the 15th of April, one got killed, the remaining 23 all lived, and are alive now. The whole number of eggs laid from Jan. 1st, 1853, to Jan. 1st, 1854, was 3337 eggs. The number laid to April 15th, 1853, was 901 eggs, an average of about 38 eggs for each hen.

Now taking 38 (the number supposed to have been laid by the hen lost) from 3337, and we have left 3299 for the 23 hens alive, which would be a trifle more than 143 eggs for each hen in a year.

My hens are all of the pure "Black Spanish" breed, from "Blake's stock." I feed them well, and always keep them shut up.

BENJ. MERIAM, in *Mass. Ploughman*.
Roxbury, April 3, 1854.

THERE are men, who by long consulting only their own inclinations, have forgotten that others have a claim to their deference.

FAT SUFFOLK PIG.

For the American Agriculturist.

FAT SUFFOLK PIG.

I SEND you a cut of a Suffolk Pig which I fattened last fall; also the following account, kept with two litters of pigs from the same sow, by Mr. DAVID CROSSMAN, of this place. The feed was bought at the prices named.

PIGS,	CR.
By one sold at 3 months,	\$6 50
" pork of ten pigs slaughtered at 8 months, 2240 lbs. sold at \$7 per hundred,	156 80
" ten pigs, 1 month old, sold for \$2 apiece,	20 00
Total,	\$183 30

PIGS,	DR.
For middlings,	\$19 35
" corn at 62½ cts. per bushel,	55 65
" barley, 62½ " "	12 00
" apples, 12½ " "	3 00
" pumpkins,	3 00
Total,	\$93 00

Balance in favor of feed, \$89 80

All these pigs were the get of the Suffolk Boar, PRINCE, late the property of the subscriber,

JOHN R. PAGE.

Sennett, Cayuga Co., N. Y.

CLAIMS OF AGRICULTURAL PATENTS

FOR THE WEEK ENDING APRIL 18, 1854.

GRASS HARVESTERS.—Martin Hallenbeck, of Albany, N. Y.: I claim the peculiar construction of the fingers, as shown, viz., having ribs at the lower parts of the fingers and vertical slots passing through the fingers on each side of the ribs and inclined plates attached to the fingers at each side. The plates preventing the sickle from clogging, and the ledges preventing the grass from being thrown out from the fingers by the action of the teeth.

CLEANING COTTON AND OTHER FIBROUS SUBSTANCES.—J. C. Hard, of Medway, Mass.: I do not claim the use of teeth made of pointed wire and screwed to the beaters of cotton pickers; neither do I claim the application of springs to the concave of machines for operating upon fibrous materials.

But I claim the use of the peculiar combing beater described, the teeth being so curved as to bring the beater very near to the feed rollers, and united with each other at their bases, in the manner of saw-teeth, as set forth.

Second, I claim the peculiar method described, of applying springs to the slats of the grating

beneath the beaters, each slat being furnished with independent springs, whereby the moats, as they fall upon the grating, are instantly knocked through the spaces beneath the slats, and are not carried round by the beater, to be entangled with the material, the slats yielding to permit the impurities to pass between them.

Third, I claim the introduction of heated air into machines for picking and dusting cotton, by which a greater uniformity of the numbers of the yarn is obtained and the material is more thoroughly and readily cleansed.

PROCESS FOR BLEACHING FLAX.—J. A. Roth and Joseph Lea, of Philadelphia, Pa. Patented in England, May 26, 1853: We claim the process of distributing the flax fiber or yarn upon combs, or equivalent devices, and agitating the same when immersed in chemical bleaching solutions, as described.

MACHINE FOR BLEACHING FLAX.—J. A. Roth and J. Lee, of Philadelphia, Pa.: We claim, first, the employment of the series of combs for the purpose of sustaining the fibers, constructed and arranged as described.

Second, the flax or yarn frame and method of arranging the combs in combination therewith, as described.

Thirdly, the combination of flax and yarn frame and vat, as described.

IRON FENCES.—M. P. Coons, of Brooklyn, N. Y.: I do not claim any particular device or construction of a post or straining pillar, nor any particular mode of attaching wire or rods to them.

I claim combining a spring bar with the rails, wires or other equivalents of metallic fence, as set forth, for the purpose of yielding to pressure or strain arising from change of temperature.

POTATO WASHING MACHINES.—J. H. Fairchild and Sylvanus Richardson, of Jericho, Vt.: We claim the manner described of constructing the machine with an outer solid revolving cylinder, for containing water and catching the dirt removed from the roots with an inner slatted cylinder which is secured fast to the outer cylinder, and revolves with it for removing the dirt and foreign matter from the roots, and discharging them in a clean state at one end of the machine, in combination with the spiral or screw thread placed in a spiral manner between the two cylinders, for the purpose of separating the dirt from the washed roots and effecting its discharge simultaneously with the discharge of the roots at the opposite end of the machine through the passage, as set forth.

FLY TRAPS.—David and S. K. Flanders, of Parishville, N. Y.: We claim the horizontal circular rotating disk, divided on its upper surface by the ledges into sections, which sections, as

the disk rotates, pass underneath a cover of the box, which box contains a wiper that sweeps or traverses over the surface of the sections, as they pass under the cover, and throws the flies into the box and behind the wiper; the disk and wiper being operated by clock machinery or its equivalents, as described.

MACHINES FOR PARING APPLES.—J. D. Seagrave, of Milford, Mass.: I do not claim, in general, the device of combining with a paring machine in which the paring knife moves automatically over the apple, a sliding piece, moved automatically in regular alternation with the movements of the knife, in such manner as to push the apple from the fork at the completion of the paring.

MAIZE HARVESTERS.—Wm. Lapham, executor of Seneca Lapham, dec., late of Salem, Ohio.: I claim arranging and operating the reel, that is hanging the reel on a frame working vertically in ways and supplied with suitable stops for receiving and discharging at intervals the cut maize, as set forth.

Re-issue.

COTTON GIN.—Fones McCarthy, of Orange Springs, Fla. Patented originally July 3, 1840: I claim the combination of a stripping plate, breast plate, and drawing roll, as set forth.—*Scientific American.*

HORSEBACK EXERCISE.

RIDING on horseback is, perhaps, of all others the most manly, elegant and efficient form of exercise. In the first place, it cannot be taken without being out of doors; then it enables you to breathe a larger amount of fresh air than if walking, because you pass through a greater space in less time, and consequently a greater number of layers, or rather sections of fresh air, come in contact with the nostrils, with less fatigue. Another advantage is, that all the muscles of the body are exercised in moderation, and, to a certain extent, equally so. And then again, while thus exercising, and while every step forward gives you a fresh draught of pure out-door air, the mind is entertained by every variety of objects, new things being constantly presented. The only thing to be guarded against, is a feeling of chilliness; this is essential, for every chill is an injury; whether a man be sick or well, a chill must necessarily be succeeded by a fever, and fever is disease.

Horseback exercise, to be highly beneficial, should be active—a "hand-gallop," or a trot; and, if practicable, a different road should be traveled every day, so that the mind may be diverted by novelties, and thus compelled away from bodily ailments.

The English, as a nation, are a stout, robust, hearty race. The nobility have a long list of names who have lived to the age of seventy, eighty, and even ninety years; but horseback exercise with them is a national amusement; many of them make a ride on horseback as much a matter of course as a daily dinner. Almost the only gentleman seen on horseback in New-Orleans, is the English merchant, showing the power of a national habit, and its influence abroad, as well as at home.

If parents could be made to comprehend the full advantages of a constant breathing of pure air to their children, and would be at pains to impress their young minds with its high importance; were they to pay more attention to their physical training, requiring them to take active exercise, four hours every day, on foot and on horseback, there would be some probability that, notwithstanding the heat and impurities of a city atmosphere, those children would grow up in healthfulness, and live to a good old age, instead of paleing away, as they do, long before their prime, growing prematurely old, from a constitution blasted in the bud.—*Hall's Journal of Health.*

THE best time is now, the best place is here.

Horticultural Department.

TO HORTICULTURISTS.—Our weekly issue of so large a journal, gives us ample room to devote to the different departments of cultivation, and we have commenced with this volume, to allot a separate space to Horticulture. We have secured additional efficient aid in its conduction, and we invite horticulturists generally, to send in their contributions on all subjects interesting and instructive to those engaged in similar pursuits with themselves. We are receiving the leading foreign and domestic horticultural journals, and shall be abundantly able to bring promptly before our readers all that transpires, which may be new and useful.

NEW-YORK HORTICULTURAL SOCIETY.

THIS Society held its regular meeting at its rooms, 600 Broadway, on Monday evening, at seven and a half o'clock, Mr. J. C. GROSHAN in the chair.

The Committee on Vegetables reported progress. Mr. HEPP presented three designs for Suburban Gardens and Villa Sites of areas, varying from half an acre to 13 acres. He gave us his views, through Mr. SCOTT, that in landscape gardening, we should conform to the natural scenery rather than adopt a contrast. That in the grouping of plants and flowers, we must follow nature, or the eye will not rest upon it with pleasure. It can be done only by a philosophic study of nature. Mr. DOWNING commenced this system, and left it to his students and followers to carry out.

Mr. PARSONS read an essay on the instructive and pleasing character of the products of nature, and the importance of cultivating the taste of our children for them.

Mr. MEAD concurred with Mr. HEPP in his views as to conforming to nature in laying out grounds, but thought it would be a long while before it would be done in this country. Our merchants retire from business as they are about to die, and at once task themselves with the adorning of a country residence and its grounds, without a knowledge of the laws of nature, and therefore do not follow them. He was glad that Agricultural schools were springing up in the land. We need gardeners that understand their business, and to ensure this, let us require of them a certificate of ability from any responsible Horticultural Society after a thorough examination.

Mr. HOGG, Jr., said that in the laying out of ground, convenience and usefulness should be consulted as much as a pleasing effect. Curved walks where they are not necessary, and hedging any walk, without it is a screen, are in bad taste. Also making a circular figure and planting an evergreen in the center. The beauty of trees and shrubs are enhanced by planting in belts and masses, allowing different kinds gradually to intermingle. Evergreens mingle well with many other trees, and produce a fine effect.

Mr. MEAD suggested that Mr. HEPP, in order to be better understood, should prepare an essay on landscape and suburban gardening covering the whole ground, to be read at the next meeting.

On motion it was resolved, that when we ad-

journal, we adjourn to meet on Friday of next week, at 11 o'clock, at Barnum's Museum.

Mr. SCOTT announced his inability hereafter to be present and report the proceedings of the Society, when, on motion, the subject was referred to the Committee on Conversational Meetings.

Mr. W. S. CARPENTER, exhibited a fine bouquet of wild flowers. Mr. WM. CRAMPTON, gardener to Mr. A. H. STEVENS, exhibited a fine collection of cut flowers, Hibiscus, Ixias, &c. Mrs. HOLBROOK, by her gardener, DAVID SCOTT, exhibited some beautiful seedling Calceolarias. Adjourned.

PRUNE YOUR RASPBERRIES.

If not already attended to, let this be done immediately. Four or five good canes are enough for one stool. Let the others be removed, and if you have no occasion to make a new plantation, distribute them among your neighbors. Many of them have never raised a fine raspberry, have not even heard of an Antwerp or a Fastolf. Help them and their children to a little knowledge from your garden every spring. It will make fruit-thieving less probable in your neighborhood.

LONDON FRUIT MARKET.—We notice in a review of the Covent Garden Market under date of March 11th it is said, "Pears are now confined to *Burré Rance*, *Easter Burré*, and *Ne Plus Meuris*, at from 75 cents to \$1.50 per dozen.

"Among dessert apples there are still good samples of *Ribston Pippin* and *Old Nonpareil* at \$1.50 to \$2.00 per bushel, or 15 to 25 cents per dozen.

"Late Grapes are getting scarce, and *Hot-house Grapes* command from \$2.50 to \$5.00 per pound; and among vegetables, cucumbers 37½ cents to 75 cents each, and asparagus \$2.00 to \$2.50 per 100."

TO KEEP FLEAS AND BUGS FROM CUCUMBERS. ?—One who has tried the experiment successfully for three years, informs the *Bangor Mercury* that a few seeds of tomato dropped into the hill with cucumbers, or a tomato plant set out, which is the better mode, will keep off black fleas and striped bugs, who dislike the flavor of the tomato.—*Journal of Agriculture*.

For the American Agriculturist.

THE CURCULIO—THE SOLFATERRE ROSE.

In the first No. of the twelfth Vol. of the *Agriculturist*, you inform your correspondent that "Mr. MANRICE paved the ground under his plum trees, but did not entirely succeed until he had a tight board fence put up around them." He has not yet succeeded, although he has tried a board fence, paving the ground, and covering with gauze. I will now describe how it was performed. The trees were planted about six feet apart, five years old, growing vigorously, blossoming beautifully every spring, yet all the fruit would be destroyed by the curculio before it began to color, when the experiment commenced.

First, there was a tight board fence, 115 feet long, 45 feet wide, and 10 feet high, erected around the trees. For two succeeding years after that, we got a few plums; all the fallen plums were picked up regularly and destroyed; but with this precaution the curculio went ahead. Then it was paved with brick, and the result was a few plums two years in succession. Then an-

other enemy, the mildew, made its appearance. To remedy that, we removed every other row of trees, leaving them 12 feet apart between the rows. This was done in the fall of 1852, and in the spring of 1853 all the plum trees were covered with gauze, which was kept on until the plums began to color. In 1853 there was but little blossom, and the curculio destroyed most of the fruit that set. This year as soon as the plum season is over, I will let you know the result. It appears to me that the curculio is extremely difficult to eradicate after they are established. We have succeeded in keeping them away from some Apricot trees trained on the back outside wall of a "leanto" grapery. They were covered with gauze, fastened on very carefully with laths and nails, so as to prevent their ingress. I have tried every nostrum I have seen recommended in the periodicals, but with no success.

I have been very successful this year in keeping celery. It was lifted with roots, and packed—but not to touch each other—in sifted coal ashes, covering the ashes after the celery is laid in with a little dry straw, and placing in a cool dry tool room.

Can any of your readers inform me if the *Rose Augusta*, sent out last spring for \$5 per plant, is different from the *Solfatère*? I have been informed by an eminent rose-grower, that it is the same plant. *Solfatère* is a beautiful rose when half open, but very ragged when fully expanded. There is one in the conservatory at this place, 17 or 18 feet high, with scores of flower buds on it. The *Solfatère* might be purchased of any florist for half a dollar per plant.

RICHARD PARNELL,

Gardener to D. F. Manrice, Esq.

Oatlands, L. I., April 5, 1854.

The last time we had the pleasure of conversing with Mr. MANRICE (previous to writing the article alluded to by our correspondent) on the subject of the curculio, we understood him to say the high board fence had prevented its ravages among his plums; but he more probably said he *hoped* it had. We are very glad, however, to be informed of the facts of the case; though, of course, we deeply regret, in common with many others, that it did not succeed.

The *Augusta Rose* is no better, nor distinguished from the *Solfatère*. We have had it in bloom, and our opinion coincides with that of all who know it. The advertisement and sale belongs to a class of transactions which should be severely condemned. The *Solfatère* is one of our best roses, and the *Augusta* being equally good, is worth just 50 cents each. It has been sold extensively by some for \$5, under the representation that it is a *hardy, climbing, ever-blossoming yellow rose*. If it possessed all these qualities, \$5 would be cheap; but unfortunately it does not; like the Dutchman's horse, which "washt a first-rate horshe, only he washt blind, lame, and had the heavshes." Most roses are ragged when full blown.

GRAPES FOR FOOD.

SOME months ago, we noticed in some of the foreign journals, in the proceedings of one of the most distinguished medical societies, a strong recommendation of grapes as a preventive or even curative of consumption.

It was stated their free use resulted in the happiest effects to persons thus affected, by aiding them in respiration, from the application of the grape sugar, which has a great affinity with the oxygen of the atmosphere.

We have often heard it asserted that a lung affection is unknown among the vineyard dis-

tricts of France, where the grape is abundantly used as an article of food.

We have long been of the opinion, and our practice has confirmed it, that grapes are the most wholesome of all our fruits.

VINE MILDEW.

THE *Gardeners' Chronicle* of the 25th March, contains the following interesting and instructive article on this subject:

Frequently as we have called the attention of our readers to the subject of the VINE MILDEW, we should be guilty of an unpardonable omission if we did not direct their notice to the very remarkable pamphlet of M. BOUCHARDAT, which was originally published in the memoirs of the Imperial Central Agricultural Society of France, but which is now to be had in a separate form. Its excellence does not consist in any new or brilliant discoveries, but in the patience with which the disease has been watched, and materials collected for its study, whether historical or physical. The collection of Vines in the Luxembourg Gardens is beyond all doubt the most extensive in the world, comprising above 4000 individuals from every country where the Vine is cultivated, arranged under 2050 numbers, consisting either of distinct varieties or sub-varieties, or coming from distinct and different localities. Every plant in this collection was examined during the prevalence of the Vine mildew, and a table drawn up, showing in what degree every separately numbered variety was affected. With the exception of the American Grapes, scarcely one escaped, and not all of these; and, unfortunately, in the majority of instances the Vines of inferior quality were those which escaped the most completely, though a few of those which supply the best wines of Bordeaux and the Gironde, as the Carmenet, the Cots, and Sauvignons, have been only slightly attacked. The value of such a list, faithfully drawn up, is incontestibly of the highest importance to all who have extensive interests in the cultivation of the Vine, and the more so because it seems quite certain that the malady spreads the most readily where a variety of different sorts are cultivated in the same vineyard. Even the American Vines and the European varieties, known under the name of Cots, become at last infested when in company with other varieties which suffer extensively. It is also quite certain that Vines which are kept low and propagated by layering, are far less subject to attack than those which are trained on trellises; and it is probable that the best method of improving those trellised Vines which have suffered seriously, is at once to bring them down to the surface of the soil, and to encourage the growth of new shoots from the depressed stems. It appears, also, that the time of pruning is by no means a matter of indifference, and that far greater impunity is secured by spring than by autumn pruning.

Two other chapters are very valuable, the one because it contains an account of almost every plan which has been adopted to alleviate the malady, the other because of the long and very complete list which it affords of the works which have appeared on the subject, or even bear upon it, from the earliest times far into 1853; nor is it merely a dry list of titles, but affords, in many cases, interesting notices of the contents of the respective books and pamphlets themselves.

The great mass of evidence, and the opinions of a large portion of those who have examined the subject scientifically and practically, is in favor of what is called the fungal theory; and, perhaps, in consequence of the truth of that theory being so much more palpable than in the earlier Potato murrain; and the efforts, therefore, directed to a particular end, so much more success has attended remedial attempts than in the other malady first mentioned. So much is this the case, that were it not for the

almost unconquerable prejudices of the Vine-grower, there seems every reason to believe that the malady, should its ravages be unhappily continued, would be, to a very great extent, under the control of the cultivator.

MILDEW ON GOOSEBERRIES.—Mulching alone is most generally recommended as a remedy for this; but whenever possible, we prefer growing them on a cool moist soil, and on the northwest side of a high wall or fence, so as to keep them out of the sun as much as possible. Where this cannot be done, we plant them between the rows of garden fruit trees, which shade them well during the heat of the day—and also add the mulching. When other shade cannot be had, it is a good plan to sow oats early in the season among them. As these grow up, they answer the same purpose as mulching and tree shade.

For the American Agriculturist.

THE UNITED STATES AS A FIELD FOR GARDENERS.

IN your last week's issue, you publish a communication on the subject of emigrant gardeners, addressed to the editor of the *London Gardener's Chronicle*, JOHN LINDLEY. Might I, a foreign gardener, resident upwards of four years in the United States, be permitted to state what I know of the spirit and motives which induces Dr. LINDLEY to publish so many erroneous impressions of writers who know nothing of the real state of the case, and also to adduce a few instances which have occurred within my own observation, to prove that this is the *very best field for good gardeners*; but to insure success, and merit the respect of their benefactors, they must become as much as is reasonable, citizens of the republic, not hankering after the despotism of the country which has refused them a home and fair remuneration for their labor. I can scarcely conceive a more despicable spirit than that which prompts a man to accumulate a sufficient amount of wealth in this free country, and then return to spend his latter days in servility. No wonder foreign gardeners are despised, if this be the spirit which characterises them. We shall look for A PETTAGREW'S "opinions and counsels" so kindly promised. R. R. S.

New-York.

For the American Agriculturist.

HARVESTING CORN.

IN your issue of March 15th, No. 27, you published an invitation to correspondents to answer some of the questions of a Mr. T. R. JAYNES, Jr.

As you have not restricted us in the selection of our subjects, I propose to give you a description of the manner of securing the corn crop in this neighborhood. Mr. JAYNES says the custom in that part is "to strip the fodder and top the stalks."

Now that is perfectly useless, only as regards the increase of manure from the individual parts which are thus saved, for as far as I have ever observed, cattle will eat stalks that have been allowed to stand as they have grown, better than those that have been cut up and shocked for the purpose of saving some of the leaves.

The manner practised here, is to let the corn stand until the ears are fully ripened, there being other work to occupy the hands until then.

Any time at which the owner thinks the corn fit to be gathered—and this is according to the different judgments of men—he sets one hand or more in the field. We begin on the fourth row from the fence, if it suits to begin near it, and throw eight rows of corn to one row of heaps. Some put only six rows of corn to one row of heaps, but it is not so good as the first way, for you must either ear your corn before

the stalks are cut, or in cutting the road for the cart, you must carry the rows of stalks cut a hill or two, to lay them out of the way of the wheels. If the stalks are cut and stacked before the corn is carted, in cutting them you have either to lay a row of stalk heaps upon the heaps of corn, or walk over the corn heaps. By throwing eight rows together, you obviate all these disadvantages. The stalks are never bound in bundles as they are in some parts of Pennsylvania, and the upper part of this State. If the ground is not needed to sow wheat upon, they are stacked in rows, each containing five or more rows of stalk heaps, according to the size of the stalks. This may either be done before or after the corn is carted.

There are many modes of tying the stalks. Some tie them with straw, some with sweet potato vines, but more with the stalks, as they are more handy. I think the best way is to stick long stalks into the heap about as high up as the husks. They should be driven in as far as the husk on them, and should be about a foot apart.

I will describe the manner in which we clear our stalk ground for the purpose of sowing wheat. It is generally planted one or two weeks sooner than the other fields.

If the lot is small, the corn is husked, the stalks cut and carted up to the stack-yard. But if there are several acres, the corn is either husked, and the stalks set up in rows on the ground, or the stalks are set up without being husked. If the former mode is adopted, the heaps are made to occupy but three rows of corn, that being from 12 to 15 feet, and placed as closely as necessary. On our farm, we put 12 rows of stalk heaps to one of stacks, but if the stalks are small, more may be put in a row of stacks. If the second way is adopted, the stalks are cut and four hills put in a bunch, or more, if the corn is light. When they are to be put in stacks, the row is put upon the rows of stubs which, were the corn off, would come in the ridge of the land. There are two lands set up in one row of heaps.

After the hurry of the season, these heaps are husked, and the stalks of two heaps are joined and set up in the manner I described above. In the spring these blank places are sown with oats. The cattle do not eat these stalks as well as those gathered later. EDGAR.

Woodstown, Monday, April 17, 1854.

THE USE OF THE FLOWERS.

BY MARY HOWITT.

God might have bade this earth bring forth
Enough for great and small,
The oak-tree and the cedar-tree,
Without a flower at all.
He might have made enough, enough
For every want of ours,
For luxury, medicine, and toil,
And yet have made no flowers.

The ore within the mountain mine
Requireth none to grow,
Nor doth it need the lotus-flower
To make the river flow.
The clouds might give abundant rain,
The nightly dews might fall,
The herb that keepeth life in mau
Might yet have drunk them all.

Then, wherefore, wherefore were they made,
All dyed with rainbow light,
All fashioned with supremest grace,
Upspringing day and night;
Springing in valleys green and low,
And on the mountains high;
And in that silent wilderness,
Where no man passeth by?

Our outward life requires them not,
Then wherefore had they birth?
To minister delight to man,
To beautify the earth;
To whisper hope—to comfort man,
Where'er his faith is dim;
For whose careth for the flowers
Will care much more for him!

American Agriculturist.

New-York, Wednesday, May 3, 1854.

BOUND VOLUMES.—We have a few sets (26 numbers) of volume eleventh, bound and unbound. The price, at the office, of the unbound volumes is \$1.00. The bound volumes are neatly put up in cloth covers, gilt backs, at \$1.50.

We can also furnish the covers separately, gilt and all ready for putting in the paper, for twenty-five cents each. With the covers thus prepared, any bookbinder can complete the binding for twenty-five cents. Volumes sent to the office will be bound complete for fifty cents.

We are having printed a new edition of the first ten annual volumes of the monthly *Agriculturist*, which can be supplied for \$1.25 per volume or \$10 for the set of ten volumes.

BACK NUMBERS.—We have taken the precaution to print each week a large number of extra copies, so that we can still supply new subscribers with full sets from the beginning of this volume, (March 15.) Any copies accidentally lost by a subscriber, will be freely supplied. Specimen copies sent to any person, whose address is furnished post-paid.

A THING TO PLANT PEAS WITH.

A BRUSH seed-sower gives the uninitiated a very imperfect idea of one of the most convenient garden implements ever invented. We recently tried one on our premises, for the first time, to the great astonishment of the functionaries, who only use the primitive seed-sowers—thumb and fingers. Our assistants in the garden are MERCURY—not the famous messenger of the heathen gods—but a gentleman of color, who does up the needful in the village gardens, as opportunity offers; and UNCLE JONATHAN, who does the all-work upon our premises. Both are somewhat set in their notions, and eschew all innovations upon the good old ways in which they have been educated.

When the seed-sower was set down in the pea patch, MERCURY gave the new comer a very significant grin, showing his ivory from ear to ear. Uncle JONATHAN ventured to inquire “if there was some more book-farming ahead?”

“Shouldn’t wonder,” responded MERCURY, “guess him is a new dung cart, to spread guano and simperfospat, that the boss talks so much about.”

The patch had been nicely manured and plowed, and a long line being stretched next to the wall, a bed about a foot wide had been nicely raked to clear it of stones and clods.

“Now,” said we, “let us try this new wheelbarrow, MERCURY, and see if we can’t get along a little faster planting peas, than we did last spring.” Adjusting the wheel to its place, and filling the hopper with peas, we started off, guiding the machine by the line. This seed-sower, as all know who have seen it operate, digs a trench for the seed, then covers, and rolls the soil over it. After the ground is prepared, a drill may be planted as fast as you can push the wheel. Away we went the whole length of the patch, the peas rattling merrily, and the roller doing its work perfectly.

“There, MERCURY, what do you think of that;

two hours of hard back-aching work done up in ten minutes; and the peas sown much better than you could have done it with your hands, if you had done your best?”

MERCURY’s eyes looked uncommonly large as he shook his head and said:

“Guess we better wait to see if the peas don’t grow down toddler way.”

“Wal neow,” exclaimed UNCLE JONATHAN as he leaned on his hoe handle, “that is rather curious. Du yew think them ere peas will come up?”

“Come up! Why not? They are put in a drill two inches deep, and as handsomely planted as you could do it with a hoe.”

A few rounds with this seed-sower finished our job, and we had the pleasure of assuring our conservative assistants that we had paid for both of their day’s work in our brief use of this new fangled notion. It is evident that their faith in the primitive implements of culture is somewhat shaken, but they are not yet converted. If the peas are not good, and fail to germinate, both of them will lay it to the method of planting, and triumphantly affirm that they knew it would be so. Almost all kinds of garden seeds are sown with equal facility; and the implement, in a garden of the extent of an acre, will pay for itself twice over every season. And yet, not one garden in a hundred has this simple labor-saving machine. Intelligent men are paying one dollar and a half a day for labor, and refusing to purchase a tool which will make one man do the work of five. The value of good tools, for the farm and garden, are not yet half appreciated.

WASTE MANURES.

MANY farmers thoughtlessly throw into the roads or the streams running near them, things which are highly valuable as fertilizers—such as corn cobs, the decayed vegetables and scrapings of their cellars, dead animals, pieces of leather, old shoes and other clothing, hair, and even ashes. All these things should be added to the manure heap, and allowed to decompose and be mixed up with it. In our daily walks, we notice more or less of this waste, more particularly among small farmers, some of whom are sending their money to the city for street manure, guano, poudrette, &c.; a cart load of which they might annually make at home, at one-fourth the cost of what they pay for it abroad. Besides, such things lying about the house or outbuildings look very untidy, and often are extremely offensive and disgusting.

BULLS AND MARES IN BUENOS AYRES.

WE learn from Mr. WM. HOLLY HUDSON, agent of the U. S. and Paraguay Nav. Co., and recently from Buenos Ayres, that during the three months prior to his leaving, there were immediately around the above city, according to official report, forty-eight thousand *mares* slaughtered for their hides and tallow. This is softer than beef tallow, but is used mostly for similar purposes. Large quantities are sent to the New-York market. The owner of a single estate in looking over his cattle concluded there were too many bulls for the good of the drove, and decided to *thin* them out. Between *seven* and *eight thousand* bulls were killed in this

single *thinning*. This is vouched for as the literal truth.

BARN CELLARS—FARMING IN RHODE ISLAND.

IN a recent trip through the town of Westerley, R. I., we were struck with this evidence of the progress of agriculture. Every new barn put up within the last five years was furnished with this important appendage. We started to visit the farm of a gentleman who had made himself somewhat famous by the changes he had wrought in a little worn-out farm, a short distance from the village. The soil in this town is, much of it, very light; and this farm was, nearly all of it, a miserable goose pasture when it came into new hands. Stable manure from the village was drawn out in liberal quantities, and applied to the corn fields. A new barn was built, and soon filled with hay. This soon became too straight for the increasing products of the farm, and another was built much larger, with a commodious cellar, some ten feet deep, under it. This receptacle gets well filled with manure every year, and tells upon the corn fields. On those starved fields, where less than a hundred bushels of corn could be raised, a thousand bushels now grow, to the great satisfaction of the owner. Besides this, some eighty tons of hay are cut to fill those ample mows. Fields cleaned of stones, and new walls, yellow from their fresh beds in the iron soil, are every where visible from these new barns. The neighbors on either side, have felt the contagion of this good example, and built large cellars under their barns. These cellars and the muck swamps have had a meeting, and formed a conspiracy against the worn-out farms of Rhode Island. The Mullein plantations that once flourished so conspicuously in all this region, are going down before this formidable combination. Dorr’s rebellion was not a circumstance to this treason against the *standing* order of Mullein. The reign of this ancient and venerable plant is broken, and if the conspirators push their work vigorously, it will not be long before there will not be a remnant of Mullein for herb drink.

Rhode Island has a vigorous State Agricultural Society, and the State is so small, and so favored with railroads and steamboats, that this Society can easily do up the work of the county Societies. The annual exhibitions of this Society at Providence, the distribution of its transactions, and the circulation of agricultural papers among the people, have done a great work for Rhode Island husbandry. We rejoice in it heartily, and would take occasion to speak a word of encouragement to our brethren of the agricultural press. They often look despondingly upon their past efforts, and think that this and that article exhorting to improvement, were lost efforts. Sitting in their chairs, perhaps in the city, far away from the fields of toil, which their thoughts are making green and fruitful, they think their task both thankless and useless. It is not so. No class in the community are improving so surely as the farmers. The readers and thinkers among them are multiplying every year. The good seed that is sown springs up and bears fruit. That article on soiling cattle with Indian corn, written three years ago, led to a dozen experiments the first year, and these led to a hundred the second;

and these experiments have, in many instances, fixed the habit of sowing corn for soiling every year. It is a glad sight to see these evidences of improvement in our farming population, and to know that our labors are not in vain.

MORE SHORT-HORN CATTLE COMING.

THE Liverpool correspondent of the *Mark Lane Express* says, that the ship *Sultan* has sailed thence on the 8th of April for New-York with twenty-four head of pure-bred Short-horns, recently purchased in this country by Messrs. Brooks & Fuller, agents of the Livingston County Importing Company, in the Genesee Valley, of the State of New-York. Amongst them was a fine young bull and eight heifers from the herd of Mr. J. S. TANQUERAY, of Hendon, Middlesex. The former is a son of the celebrated bull *Balco*, bred by Mr. Bates, and now owned by Messrs. BECAR and MORRIS, of New-York, U. S. It will be remembered that he was sent out from here last summer. The heifers are choice specimens from Mr. Tanqueray's herd, and some of them are in calf to the *Duke of Gloucester*, the bull bred by Earl DUCIE, and which sold at so high a figure at the Tort worth sale in August last. In addition to the above were seven cows and heifers from the herd of Mr. BARNETT, Stratton Park, Beds, several of them by *Horatio*, now owned by Mr. TOWNELEY, of Towneley Park, in this county, and a brother of his far-famed prize cow, *Butterfly*; also one bull and three heifers from Mr. LADD's herd at Ellington, Hunts; one bull and heifer from the stock of Mr. CARTWRIGHT, of Aynhoe; both of these were by "Upstart," with two other bulls, bred by Mr. Ambler, of Watkinson Hall, and Mr. Fawkes, of Farnley Hall, Yorkshire. I hope also to be able to send you further accounts of some important shipments that are intended to be made from here early in the ensuing month, for other influential stock-importing companies from the western states of America, the agents of one of them, Dr. WATTS and Mr. WADDLE, have been making great search in the United Kingdom for superior specimens of this favorite breed of cattle; and I learn that they have added a new feature to these exports by having already made some purchases in the sister isle; a fact highly credible to their judgment and to the Irish breeders, who have for a long time paid great attention and spared no expense in the purchase of some of the best stock from old England.

PROTECT THE LITTLE BIRDS.

WHEN the birds return to their usual haunts in the spring, let it be one of your first duties to provide for their accommodation in the way of nesting in your trees, shrubbery, and out-buildings. The Blue-bird will build in the open sheds attached to your barns and stables. The Phebe-bird (Pewee) in the wood-house. The Song-sparrow in the lilacs, snow-balls, and other high shrubbery. The Yellow-bird, the same. The Humming-bird where nobody can find it—while the Cat-bird, Robin, and other large birds, will appropriate the larger fruit and shade trees. As to the Wren, that brisk and pugnacious little fellow, must have an old hat, a little box, or an oyster keg stuck into a pole in the garden, or into a fruit tree, or nailed on to an out-house.

He is a *mighty* particuliar body, like some other very small folks, and must have extra accommodation.

In our last volume, page 2, we informed our readers that Mr. DeFOREST, of Dutchess county, takes the skeleton of an ox's head, (that of any other domestic animal would answer the same purpose,) and places it in the crotch of a tree near his bee-hives. In the holes of these skeletons wrens make their nests, and they devour the moths at the bee-hives as fast as they appear, but do not touch the bees. Thousands of instances may be added to this of the utility of birds in destroying insects of various kinds; showing us the necessity of not only protecting them on our premises, but of encouraging them to come there and occupy the trees, shrubbery, and buildings for their nests, and rearing their young.

CHILD AMUSEMENT--POP CORN.

IF you want to keep the children out of the streets in their play hours, and happy and contented at home, give each one a little patch of garden ground as soon as the earth gets warm enough to deposit the seeds in it. Don't give them a heavy, dull spade, and tell them to dig it up themselves when their strength is not equal to it, but let it be done for them, when they can rake it over, mark it out, and deposit the seeds. Show them *how* to do it, and not turn them off with a short answer to their supplications for help; but let the little fellows know that you feel an interest in their labors and pleasures; for recollect, that although this may be small business to *you*, it may be an era, a turning-point in the character of the child for a life-time. Give them nice, suitable tools, and indulge them in all the amusing things you can to attach them to their homes. This is *one* great secret of educating boys into good and useful men.

Last season we gave a couple of nephews a small patch in the garden on which they raised a considerable crop of *pop corn*. With this they entertained their little friends and those of the family the past winter with great gusto, when they came to visit them. They have just planted their patch for this season, and are now going to try various experiments with special manures on different parts of it. One of these boys is only six years old, and the other only ten, and yet they take hold of the thing with the zest of the most enlightened and scientific farmer of the country. So much for instructing children in the things they must practise when they get to be men. No sport is more interesting to them than planting and cultivating this corn. If they pleased to sell their product it would bring them a high price in the city.

REMEDY FOR SCOURS IN CALVES.—Give from one to two ounces of castor oil, according to the age of the calf. Divide this into two or more doses, and administer them once in two hours. After it has had its effect, give a little astringent medicine. Epsom salts will answer in the place of castor oil, increasing the quantity given of the former from one-fourth and one-half over that of the latter; but we much prefer the castor oil.

GOVERN thy life and thoughts, as if the whole world were to see the one and read the other.

THE CRYSTAL PALACE.

NOTHING could give us greater pleasure than to announce that this noble exhibition of the productions of labor and art bids fair to fulfil the expectations of its projectors, and to gratify the most ardent desires of a national pride which has so long centered around it.

On Thursday of this week the Crystal Palace is to be reopened, with an increase rather than a diminution of its former splendor. The exercises of that day will be universally attractive, and well repay a journey of a hundred miles to witness them.

We are happy to learn that the price of admission, on that and on *all* future days, is to be only 25 cents—not that it is not worth many dollars to see the whole Palace, but because most persons prefer to see 25 cents worth *at a time*, and thus be able to repeat their visits more frequently.

Those who are within a convenient distance, will doubtless visit the exhibition during the spring and early summer; while multitudes will now begin to make their arrangements to come to the city next autumn, at the time of the State Agricultural Show. The world has probably never witnessed a more splendid combination of attraction than will then be centered upon Manhattan Island. New-York city of itself is worth a pilgrimage to see, and when to this is added the World's Industrial Fair, and the great Exhibition of the agricultural productions of the Empire State, we shall look for a gathering which will count by hundreds of thousands if not by millions. The arrangements already making for cheap traveling will place it in the power of almost any adult person and youth east of the Mississippi to visit the city during the coming autumn. The money which most persons may save by foregoing needless expenses for a few months, will be amply sufficient for the visit.

FLOWER AND BIRD SHOW.

THE halls of the American Museum again present unusual attractions for the lovers of the beautiful. The Horticultural Society have collected here a large variety of their choicest flowers, and are competing for the liberal premiums offered. In addition to the flowers and plants shown by the Society, Mr. BARNUM has invited for competition the finest singing birds to be found in the city and elsewhere. Of these there are large numbers; and the happy combination of feathered songsters and gay flowers with their sweet perfumes, makes up a scene at once novel and enchanting. No one can fail to be doubly repaid for a visit to the Museum this week. We advise all to go as early as possible, while the plants are in their freshest bloom.

As our paper goes to press Monday P. M., we must defer a full report of this exhibition till next week.

CHLORIFORM COUNTERACTED.—Dr. Robert de Lambelle, a distinguished physician of Paris, announces that a shock of electricity, given to a patient dying from the effects of chloriform, immediately counteracts its influence, and returns the sufferer to life.

THE state of life is most happy where superfluities are not required and necessities are not wanting.

Boys' Corner.

For the American Agriculturist.
IS POULTRY PROFITABLE?
A BOY'S ANSWER.

PERHAPS you will be a little surprised to hear from a boy of 15 years, concerning poultry, but nevertheless, I will give you an account in raising poultry. On the 1st March, 1853, my father had 51 hens and 5 roosters, of the Black Poland breed, mixed with the common breed. He had also 5 ducks. I present you with the account of the hens and ducks for one year, from 1st March, 1853:

POULTRY YARD.	DR.
To 28 pair fowls at 5s. per pair,	\$17 50
" 2½ " ducks at 6s. "	1 88
" 54½ bushels corn, from 55 to 80 cts. per bushel,	32 20
" 3 bushels oats, at 3s. per bushel,	1 12
" 60 lbs. bran, at 1 ct. per lb.,	60
" Wheat screenings,	1 35
" 36½ doz. eggs set, at 14 cts. a doz.	5 14
Expenses,	\$59 79

POULTRY YARD.	CR.
SOLD.	
By 321½ doz. hen eggs, from 14 to 20 cts. per doz.,	\$48 24
" 16½ doz. duck eggs, at 14 cts. per doz.,	2 20

SOLD, & USED.	
" 17 pair chickens, at 4s. per pair,	8 50
" 36½ " fowls, at 5s. "	22 81
" 1 " " at 6s. "	75
" 2 " " at 8s. "	2 00
" 29½ pair ducks, at 6s. per pair,	22 13
" Wintering turkeys and guineas,	3 00
STOCK ON HAND.	
" 34½ pair fowls, at 5s. per pair,	21 56
" 3½ " ducks, 6s. "	2 62

\$133 89	
Deduct expenses,	59 79

Which leaves in clear gain, \$74 10

By the above it seems that each hen laid 76 eggs, and gained \$1 32. Now to the question, "Is poultry profitable?" I answer yes, and I challenge competition.

Can you send me some seed of the Acorn and Boston Marrow squash, and a few China seeds. If so, please direct them to A. Fleming, Somerville, N. J.

JOHN FLEMING.

Branchburg, Somerset Co., N. J., April 21, 1854.

HOW TO COMMENCE BUSINESS.

WELL, boys, we doubt not you would all like to rise high in the world, and become good farmers, merchants, &c. Here is a good motto for you.—*Begin at the lowest round on the ladder and keep climbing*,—and here is a story which will illustrate just what we want to say. One of the wealthiest merchants of New-York city tells us how he commenced business. He says:

I entered a store and asked if a clerk was not wanted. "No," in a rough tone, was the answer—all being too busy to bother with me—when I reflected that if they did not want a clerk they might want a laborer, but I was dressed too fine for that. I went to my lodgings, put on a rough garb, and the next day went into the same store and demanded if they did not want a porter, and again "no sir," was the response—when I exclaimed in despair almost, "not a laborer? Sir I will work at any wages. Wages is not my object, I must have employ, and I want to be useful in business." These last remarks attracted their attention, and in the end I was hired as a laborer in the basement and sub-cellar, at a very low pay, scarcely

enough to keep body and soul together. In the basement and sub-cellar I soon attracted the attention of the counting-house and chief clerk. I saved enough for my employers, in little things wasted, to pay my wages ten times over, and they soon found it out. I did not let any body about commit petty larcenies without remonstrance and threats of exposure, and real exposure if remonstrances would not do. I did not ask for any ten hour law. If I was wanted at 3 A. M. I was there, and cheerfully there, or if I was kept till 2 A. M. I never growled, but told every body to go home "and I will see every thing right." I loaded off at daybreak packages for the morning boats, or carried them myself. In short, I soon became indispensable to my employers, and I rose—and rose—and rose, till I became head of the house, with money enough, as you see, to give me any luxury or any position a mercantile man may desire for himself and children, in this great city.

A NOBLE BOY.—"Why did you not pocket some of those pears?" said one boy to another; "nobody was there to see." "Yes there was—I was there to see myself, and I don't ever mean to see myself do a mean thing!"

Miscellaneous.

Written for the American Agriculturist.

A FEW SOBER THOUGHTS.

BY MINNIE MYRTLE.

It is often the case, that the energies of an individual or a nation are supposed not to exist, when they are merely slumbering for want of occasion to call them forth. And we are to apt in the present day, to think our forefathers and foremothers alone possessed the virtues of heroism, heightened by refinement and superior cultivation; when the only difference between them and our own fathers and mothers is, that the characteristics of the former were made conspicuous by circumstances, and have been recorded, while those of the latter shine in a very limited sphere, and appear not upon the page of history, though not less worthy of such honor. We doubt not there are multitudes at the present day who would be as eminent for self-denial in any great public emergency, as were our great grandmothers, and whose home virtues would be thought as worthy of imitation were they only made known. In those days—"the times that tried men's souls"—the more toil, the more self-denial and sacrifice any man or woman endured or practised, the more he or she was honored, so that there was some recompense for suffering, as well as some incentive to labor.

Ambition is a very unwomanly trait; but it is impossible, nevertheless, for any human being to toil without motive, to be resigned to neglect, obscurity, and suffering, when conscious of deserving esteem and preferment. Every person likes to be appreciated, however humble the sphere in which he moves.

Not long since, I heard an old gentleman speak of the impressions which struck him on returning to his native village after an absence of forty years. He arrived at the old homestead on Saturday evening, and first saw the playmates of his boyhood in the village church. He took his seat where he could see the people as they entered, and for the first time in his life noticed the superior physical advantages of aged men compared with aged women. Those

who had been boys with him, though now well stricken in years, he easily recognized. They were gray, perhaps, and furrowed, but were still erect, and had no appearance of being careworn or gnawed by disappointment. But of all the blithe, merry girls whom he had known in childhood, scarcely one could he see among the groups which were seated around him. The women were old, and bent, and haggard. He looked around in amazement and also in sadness, and wondered why years had so indelibly stamped their impress on the one sex, and tripped so lightly over the brows of the other. Those who had been among the fairest and gayest in their youth, had not only grown old, but seemed to have lost all elasticity of spirit—to look unhappy as well as careworn—disappointed and wretched as well as dim. He pondered long upon the causes which could produce such a change and work such effects, but to him there was no solution. I could have told him that it was very simple.

They were unhappy. Toil alone never kills the spirit—never eats up the heart. They had toiled without recompense. Life to them had no genuine brightness. They had traveled all the weary pathway without the sunshine of love—the appreciation which alone can sustain through weariness and watching.

They had married with all the bright hopes of girlhood—with the expectation of sympathy, and the vision so beautiful to women, of trust and dependence, and found themselves looked upon as mere housekeepers; somebody to take care of children and provide for the daily wants of a family. The idea is altogether too prevalent that *sentiment* is weak and foolish, something which sensible people should not indulge in—that love is for lovers, but not for husbands and wives.

Many times have I heard children when they were grown up, speak of the way their parents lived, and the gloom which was spread over all their own childish years by the want of unanimity and kind feeling between those who should have set an example of loving one another. Nothing can ever compensate a woman for this want of affection.

I have often heard a woman censured for becoming soured and morose, by those who only looked in now and then, when I knew that there were daily and hourly falling upon her heart, cold, bitter words, which she alone heard, and which were enough to chill the warmest life blood in the veins.

Children do not speak of their parents faults. God and nature teach them that this is sin; and parents seem to think because children cannot and do not reprove them, that they do not think and feel. But there is no cause from which children suffer more, than from the alienation and dissensions of their parents. "Better is a dinner of herbs where love is, than a stalled ox with contention," is not too sentimental a doctrine for the Bible to teach on almost every page; but though the Bible is considered authority on almost all other points, on this it is deemed, practically, if not theoretically, a little too old fashioned.

It is the duty of parents to make for their children a cheerful and happy home. "To make a gloomy one is almost as wicked as to make an irreligious one," says a distinguished minister of the gospel.

In the country, children have many innocent sources of amusement, and lay up a store of delightful reminiscences connected with home, and are not so entirely dependent on a happy fire-side as children in the city. But there is a weary weight to carry through all the pilgrimage of life, if we cannot dwell with pleasure upon the domestic virtues of parents.

Children are great observers; and they begin very young to moralize and philosophize, to draw inferences and jump at conclusions.—Where they see tears and sadness in a mother, they are very quick to divine the cause; and though they would not dare to sympathise, or let their pity be observed, their little hearts do not the less certainly become thoroughly enlisted for the sufferer. It is neither foolish nor weak to indulge and to manifest affection. It is not more beautiful and commendable in the young than in the aged. If fathers, and husbands, and brothers, wish their daughters, and wives, and sisters to be keepers at home, and contented in woman's sphere, they must make them happy there; and it is a universal weakness of woman to depend for happiness on affection; and how can they know that affection exists, unless it is manifested?

Let children see bestowed upon their mother the little delicate attentions and caresses which betoken that she is still loved, and the father will only be the more respected, and will be in no danger of seeming unmanly. There is nothing like unhappiness to destroy a woman's beauty, and make her grow old before her time; and the beauty which a blithe spirit and joyous temper gives to the countenance no time can efface.

EPITAPH ON "CHARLEY,"

A Horse, who Died (universally lamented) Dec. 25, 1853,
Aet. 23 years.

HERE lies a faithful steed,
A staunch, uncompromising "Silver Gray,"
Who ran the race of life with sprightly speed,
Yet never ran—away.

Bright were his eyes, yet soft,
And "in the main" his tail was white and flowing,
And, though he never sketched a single draught,
He showed some taste for *drawing*!

His limbs were smooth and clean,
Fitted alike for buggy or for dray;
And, (like Napoleon the Great, I ween,)
He had a martial neigh!

No light nor trifling word,
Nor empty bombast from his lips would swell:
For, save some quiet horse-laugh, chuckling heard,
His tongue was *bridled* well!

Wild oats he never sowed,
Yet masticated tame ones with much zest;
Then, cheerful, bore each light allotted load—
As cheerfully took rest.

Full oft he lay secure,
Installed within his stall so warm and fair,
Slow-ruminating, dignified, demure,
With such a *stable* air!

With here and there a speck
Of roan, diversifying his white back,
And, martyr like, a halter round his neck,
Which bound him to the rack!

Mortal he was; at length
The hey-day of his life was damped by death,
So, mustering all his once load-moving strength,
He *drew*—his final breath!

"Doctor," said a snuff-taking old lady, "do you think snuff hurts the brains?"

"Oh no, madam," replied the doctor, "people with brains never take snuff."

AN INCIPIENT MILLIONAIRE.—The Eastern man is always noted for his shrewdness; of course he begins early to attain this. How young he takes lessons we are not able to say, but we must mention an instance. A boy about eight years old, went into a shop to buy a pen-knife; he selected one.

"How much," said the boy.

"Twelve cents," said the shopman.

"Well," said the boy laying down a shilling piece, "there is twelve and a half cents; I'll take the knife, and you may give me the half cent in fish hooks."

The shopkeeper accordingly gave the boy the knife, and one fish hook for the half cent, with the remark "that he would do."

SIZE OF OUR GREAT LAKES.

THE latest measurements of our fresh water seas are these:

The greatest length of Lake Superior is 335 miles; its greatest breadth is 160 miles; mean depth 988 feet; elevation 627 feet; area 32,000 square miles.

The greatest length of Lake Michigan is 360 miles; its greatest breadth 108 miles; mean depth 900 feet; elevation 587 feet; area 23,000 square miles.

The greatest length of Lake Huron is 200 miles; its greatest breadth is 160 miles; mean depth 900 feet; elevation 274 feet; area 20,000 square miles.

The greatest length of Lake Erie is 250 miles; its greatest breadth is 80 miles; its mean depth is 84 feet; elevation 555 feet; area 6,000 square miles.

The greatest length of Lake Ontario is 180 miles; greatest breadth 65 miles; its mean depth is 500 feet; elevation 262 feet; area 6,000 square miles.

The total length of all five is 1,585 miles, covering an area altogether upward of 90,000 square miles.

REMOVING A FISH-HOOK FROM THE THROAT.—John Greiner, a lad about ten years of age, residing in the 5th Ward, was playing on Monday last with a fish-hook by holding it in his mouth, when by some mishap he swallowed it. He tried to remove it by pulling at the string, but it had become firmly lodged in the lower and back part of the throat. The little fellow was not only frightened, but in great pain; attempts were made by the boy's parents to extract the hook, but they were unable to do it. The hook had become firmly imbedded in the throat. Dr. A. Walters was called, and, after many fruitless efforts, he at length hit upon this novel and ingenious plan to extract it. Having ascertained the probable size of the hook, a pistol bullet of suitable dimensions was procured, a hole was pierced in the middle of it, and it was placed upon the line of the fish-hook and allowed to slip down to the hook. The weight of the bullet, assisted by gentle pressure downwards with a pair of curved forceps, removed the hook from its situation. Thus liberated, the point of the hook sticking into the lead, and being protected by it, was safely removed.—*Pittsburg Journal*.

DECEPTION OF THE SENSES.—It is mentioned in the Museum of Art and Science that if two fingers of the same hand, being crossed, be placed upon a table and a marble or pea is rolled between them, the impression will be, if the eyes are closed, that two marbles or peas are touched. If the nose be pinched and cinnamon be tasted, it will taste like a common stick of deal. Many substances lose their flavor when the nostrils are stopped. Nurses, therefore, upon right and scientific principles, stop the noses of children when they give them doses of disagreeable medicine. If the eyes are blindfolded, and buttermilk and claret be alternately tasted, the person tasting them, after a few repetitions of one process, will be unable to distinguish the one from the other.

SOMETHING LEFT.—The *Hartford Times* seems disposed to take the recent *decomposition* of its party pretty complacently, though inclined to hold on to any small fragment of hope that may present itself. Speaking of present prospects, the *Times* says: "The Democrats may possibly carry four Senators—probably only three, however, possibly only two."

Did the editor ever hear of the blacksmith who undertook to make an axe and burnt down his iron till he concluded to make a hatchet—found only iron enough left to make a horse shoe nail, and not succeeding in saving material enough for that, then threw what he had left into the water trough—exclaiming, "I don't care, there is enough of you for a good siss!"—*New-London Chronicle*.

ANECDOTE OF A GATE.—A correspondent of the *Home Journal*, writing of gates, tells this anecdote:

I once passed through a door-yard gate which did, unintentionally, give an indication of the designer's character. The gate was a common one, shut by a chain and ball, but the post to which the inner end of the chain was attached was carved and painted in the likeness of a negro with one hand raised to his cocked hat, and the other extended to welcome you in. As you opened the gate toward you, in going in, the negro post-pointer bent toward you, by a joint in his back, fairly bowing you in. Upon letting the gate go, a spring in his legs "brought him up standing," again, ready for the next comer. This faithful fellow performed the amiable for his master for many years, without reward, except now and then a new coat—of paint; but finally died of a rheumatic back, contracted in his master's service.

A FAMILY PARTY.—A Persian merchant complaining heavily of some unjust sentence of the lower court, was told by the judge to go to the *cadi*.

"But the *cadi* is your uncle," urged the plaintiff.

"Then you can go to the grand vizier."

"But his secretary is your cousin."

"Then you may go to the sultan."

"But his favorite sultana is your niece."

"Well, then, go the d—l."

"Ah, there is still closer family connections," said the merchant, as he left the court in despair.

No—is a great word, though it looks so small in print. In certain circumstances it is the biggest word that can fill a man's mouth. It concentrates his whole personality in a single monosyllable. The young, when tempted, find it very difficult to say it. There is a critical year or two, as they are passing to maturity, when they need parental help to enable them to get out this resolute word, *No*! The moral machinery of the man is just starting, the steam is bubbling and effervescing, longing to work. A little help at the lever will turn it on judiciously and harmonious action will result. Alas for the youth who have no wise parents to help them to say *no* at this critical period! "My son, if sinners entice thee, consent thou not."—*Examiner*.

SMART.—"Why Mr. B.," said a tall youth to a little person in company with half a dozen huge men, "I protest you are so small I did not see you before." "Very likely," replied the little gentleman. "I am like a sixpence among six copper pennies, not readily perceived, but worth the whole of them."

A MOTHER admonishing her son, (a lad some seven years of age,) told him that he should never defer till to-morrow what he could do today. The little urchin replied, "then mother, let's eat the remainder of the plum-pudding to-night."

OVERWORK OF THE MIND—A MELANCHOLY TRUISM.—In these days half our diseases come from the neglect of our body in the overwork of the brain. In this railway age the wear and tear of labor and intellect go on without pause or self-pity. We live longer than our forefathers, but we suffer more from a thousand artificial anxieties and cares. They fatigued only the muscles; we exhaust the finer strength of the nerves; and when we send impatiently to the doctor, it is ten to one but what he finds the acute complaints, which is all that we perceive, connected with some chronic mental irritation, or some unwholesome inveteracy of habit.—*Sir Bulwer Lytton at Edinburgh.*

WHAT DEGRADES.—Places and professions are not of much account. To one who has self-respect, a theatre is as safe as a throne. It is the heart carried into a thing, not the thing itself that degrades. The heart, not the position is the assurance and safeguard of virtue. It is not the profession but the heart that degrades. The most despised calling may be made honorable by the honor of its professors; nor will any manner of work corrupt the nature which is intrinsically pure. The ballet-dancer may be as high-minded as the governess; the shop-worker as noble as the artist. It is the heart, the mind, the intention carried into the work, which degrades, or ennobs the character; for to the "pure all things are pure," and to the impure, all things are occasions of still further evil.—*Chambers's Journal.*

QUESTIONS WELL ANSWERED.—A sophist, wishing to puzzle Thales, the Melesian, one of the wise men of Greece, proposed to him in rapid succession the following difficult questions. The philosopher replied to them all without the least hesitation, and with how much propriety and precision, our readers can judge for themselves.

What is the oldest of all things? God—because he always existed.

What is the most beautiful? The world—because it is the work of God.

What is the greatest of all things? Space—because it contains all that is created.

What is the quickest of all things? Thought—because in a moment it can fly to the end of the universe.

What is the strongest? Necessity—because it makes men face all the dangers of life.

What is the most difficult? To know yourself.

What is the most constant of all things? Hope—because it still remains with man after he has lost every thing else.

SPECIAL NOTICE TO ALL SUBSCRIBERS.

We find that by using such good paper, our volume of 832 pages will be quite large to bind, and especially large for those who wish to stitch their paper together with an index, without being at the expense of binding. To obviate this, we have concluded to be at the expense and trouble of making out an extra index with No. 26, so as to form a complete volume of the first 26 numbers. The index for the next 26 numbers will be given at the end of the year, or with No. 52. This arrangement will make it convenient for all, as the 52 numbers can be stitched or bound in two volumes with an index for each, or in one volume with the double index at the close.

We hope all will preserve their numbers, for there are many single articles each of which will be worth the price of the volume, for future reference. When the paper arrives from the post-office, a good plan is to see that it is properly folded, and then pin or sew it through the middle and cut open the leaves. It is very easy to stitch 26 numbers together. To do this, arrange them in regular order, and with an awl punch

several holes about one-fourth of an inch from the back, and through these run a strong thread two or three times with a darning-needle, and the work is done. We have scores of volumes of papers, pamphlets, and addresses, thus prepared, which serve all the purposes of a bound volume, and occupy less room in storing and carrying. We would, however, prefer to see volumes of agricultural papers neatly bound and laid upon the book-shelves or tables of farmers. They are much better and more appropriate ornaments, than gilded volumes of trashy magazines or novels.

ONE WORD MORE.—We thank our friends for the liberal aid they have afforded us in extending the circulation of the *Agriculturist*. Our list has increased beyond our expectation, and we are daily encouraged to labor with the utmost diligence, to make our paper worthy of the confidence and admiration of our largely increasing list of readers. Our reliance for the continuance and increase of our list is upon those who are already readers. As stated above, we now divide the year so as to give either one or two complete volumes of the 52 numbers. Number 27 begins the second volume, or half of the year. We respectfully request all our present subscribers to make a little exertion at this time, and each send us on at least one new name. If you cannot get your neighbors to send on for a year, ask them to try the paper for six months, as in that time they will get a complete volume.

TO CORRESPONDENTS.—We have several communications on hand which we will look over as soon as we have time, and some of them will be published. It is no trifling labor to prepare for the printer many communications which we receive. Some are written so closely that there is not room to put in corrections, without re-writing the whole. We cheerfully prepare articles, unless there is manifest want of care on the part of the writer. If he does as well as he can, we make all needful changes and corrections.

As most writers doubtless wish to improve their own style, we suggest to them to keep an exact copy of their communications, and then compare this copy with the printed sheet. They may often learn something in this way.

We are not anxious to receive original poetry. We have little space for rhyme, and we have good selections enough to last us a year at least. Good poetry, however, will not be rejected; but we advise all who attempt to write in verse to remember, that good *rhyme* does not constitute *good poetry*; on the contrary, some of the best *poetry* we have ever seen does not "*rhyme*" at all, while some of the best *rhyme* contains not a single *poetic* sentiment.

Markets.

REMARKS.—Flour is 12½ to 25 cts. higher in most grades; Corn 3 cts. per bushel; Pork 31½ cts. per bbl.; Lard ¼ ct. per lb.; Beef unchanged.

Cotton has fluctuated somewhat the past week, but has settled down to-day at the same rates as per our last. Sugar and Tobacco the same.

The weather was very fine and hot up to Thursday, the 27th April. The thermometer ranged the preceding day as high as 75° at noon. On the evening of the 27th, it commenced raining, which it continued gently with strong easterly winds till Saturday morning the 29th, when it blew a gale, and during the succeeding twenty-four hours the rain poured down in torrents. We never witnessed a greater fall of water in the same space of time. Sunday, the 30th, was slightly showery, closing fine at night. The destruction by the flood is terrible,

and it will take a long time to repair the devastations committed throughout the country. The season still continues very backward. We find by our record, that many shrubs and trees leave and bloom from 10 to 13 days later than last year. In 1853 the peach trees began to bloom at our residence, 16 miles north of the Battery, on the 18th of April, this year the first blossoms at the same place did not appear till the 28th.

REVIEW OF THE BRITISH CORN TRADE.

We are in receipt of the *Mark Lane Express* of April 10th, and condense a few words, all that is important to our readers in its long article on the Corn Trade. It shows an importation of Wheat into the London Market, for the quarter ending April 1st, 1854, of 381,003 qrs., against 190,621 qrs. in the corresponding time of 1853; and from this it argues that the wants of England will be equally great for the succeeding quarter to be made up of the months of April, May, and June. It also says that the advices from the Upper Baltic repeat what has already been so frequently affirmed, viz., that the Wheat crop of 1853 has proved very short, and stocks having been reduced into a narrow compass by the large shipments during autumn and winter, the supplies likely to be derived from that quarter during the summer, will, it is stated, be comparatively small.

If all this be correct, Great Britain will look to the United States for her principal supply of wheat till the next harvest. The price, consequently cannot go down much this spring and the coming summer.

The weather continues very fine in England for putting in the spring crops. Money is unusually dear there, which greatly checks speculation in grain. Were it not for this, the demand would be greater than it now is.

PRODUCE MARKETS.

Wholesale prices of the more important Vegetables, Fruits, &c., at the principle New-York Markets.

In our weekly reports we give the prices which producers actually get, and not the prices at which produce is sold from the market.

Saturday, April 29, 1854.

Rain! Rain! Mud! Mud! and yet New-York must eat! does eat, and pay for—Meer potatoes, \$4 @ \$4 25 per bbl.; Carters, ditto; Early Junes, \$3 50 @ \$4; Common, \$3 @ \$3 25; yellow Onions, \$2; red, \$2 25; white, \$3 50; white Turnips, \$2 25 @ \$2 50; yellow, \$3; Spinach, \$2 50; Russet Apples, \$4; Greenings, \$4 50; Swaars, \$4 50; Spitzensburgs, \$4 50; Baldwins, \$5; Seeknotfurthers, \$5; Green Peas, \$6 @ \$8; Parsnips, \$2 50; Carrots, \$2 50; Beets, \$2 50; Lettuce, per doz. bunches, 37½ cts. @ \$1; Onions, 62½ cts.; Vegetable Oysters, \$1; Celery, \$1 50 @ \$2 25; Rhubarb, \$6; Rape Sprouts, \$1 75; Maple Sugar, 10 @ 12c. per lb.; Old Butter, 14 @ 18c.; New Butter, 23 @ 25c.; Eggs, per doz., 14 @ 16c.

NEW-YORK CATTLE MARKET.

Monday, May 1, 1854.

Owing to the unprecedented storm of last week, the number of cattle in market is much less than usual. The day is pleasant, though cool. This, and the limited number make prices high, considering the quality, which is uniformly common throughout the yards. But very few of the cattle show stable care. Feeders would do well to notice that their animals would bring them enough better prices, from their looks, to pay all trouble in stabling.

Prices range from 8½ @ 11c. per pound.

Washington Yards, Forty-fourth street.

A. M. ALLERTON, Proprietor.

C. M. S

VIRGINIA LAND FOR SALE.

A S COUNSEL AND AGENT FOR THE HEIRS OF DAVID ELLINGTON, dec'd, I offer for sale a tract of land containing about 1000 acres, lying in Prince Edward's Co., Va., on the Richmond and Danville R. R., about 4 miles above its junction with the South Side Railroad. Its location, with respect to the two Railroads, gives it every necessary market facility. The soil is naturally free, and is susceptible of a high state of improvement, but for the last 13 years it has been lying in a neglected state, during a controversy (now recently determined) in respect to the will of the former owner. The present owners reside in several of the Western States, and for this reason it will be sold at a great bargain. One or more skillful and enterprising farmers from some of the Northern States would find a profitable investment in this land. The quantity of timber land is amply sufficient for all the purposes of the farm. Besides the adaptation of soil to the cultivation of tobacco, and all the usual grain crops of the country, it is probable that the hay crop can be made easy and profitable, in consequence of the large quantity of branch flat. It is estimated that the aggregate length of the small streams which water the tract, is from ten to twelve miles! Further particulars will be given, when requested, by the undersigned whose address is "JEFFREY'S STORE P.O., NOTTOWAY CO., VA." Persons desirous of examining the land can easily do so as it is within two days' travel from the city of New-York.

April 6, 1854.

W. C. KNIGHT.

CRANBERRY VINES.—100,000 FINE BEARING PLANTS, of the Bell variety, which are commonly raised in New-England. On low ground, with a little care, they bear large crops. They can be forwarded at any time between this and the middle of May, to any part of the United States. A circular, with mode of culture, soil, and price, will be forwarded to all who may want information on the subject.

April 1st.

TROWBRIDGE & THOMPSON, [32-34] New-Haven, Ct.

PORTABLE FORGES AND BELLOWES.

constantly on hand. The above forge has been awarded three Silver Medals by the American Institute, New-York, and the highest premium (Diplomas and Bronze Medals) at all other Fairs wherever exhibited.

FREDERICK P. FLAGLER, Sole Manufacturer, 210 Water st., N.Y.

KETCHUM'S IMPROVED MOWING MACHINE WITH entire change of gear. The only successful mower now known.

Ketchum's Improved Machine, which we are building for the harvest of '54, was thoroughly tested last season, and the advantages gained by our change of gear are in all respects as we designed, viz: durability, convenience and ease of action. The shafts now have bearings at both ends, which overcomes all cramping and cutting away of boxes. A counter balance is attached to the crank shaft, which gives it a steady and uniform motion. Each Machine can be thrown out of gear; there is great convenience in getting at each and every nut, all of them being on upper side of the frame: oil cups are attached to all the bearings, which, by the use of a wad of cotton, will hold oil for a long time, as well as protect the bearings from dust, grit, &c.; the finger bar is lined with iron its full width, which protects it from wear.

These and various other additions for strength, durability, &c., makes them the most simple and perfect agricultural implement in use. They weigh about 750 lbs. each, and can easily be carried in a one-horse wagon.

They will cut ALL KINDS OF GRASS, and operate well on uneven or rolling lands, or where there are dead furrows. This Machine took the highest award, with SPECIAL APPROBATION, at the World's Fair, it also received, during last season, one silver and four gold medals, and various other flattering and substantial testimonials of approval. We have spared neither pains nor money to make them deserving of public favor, and hope to be able the coming season to supply the great and increasing demand.

We take this occasion to caution farmers against buying UNTRIED Mowers, if they do (as was the case with many last year) they incur loss, vexation and disappointment.

In all cases where Extras are wanted, be sure to give us THE NUMBER OF YOUR MACHINE.

(WARRANTY.) That said Machines are capable of cutting and spreading, with one span of horses and driver, from ten to fifteen acres per day of ANY KIND OF GRASS, and do it as well as is done with a scythe by the best of mowers.

All orders filled by the subscribers. Office and Shop, corner of Chicago street and Hamburg Canal, near the Eastern R. R. Depot, in Buffalo N. Y.

HOWARD & CO., Manufacturers and Proprietors.

For Sale by R. L. ALLEN, 189 Water street, N. Y.

The Mower is also manufactured by Ruggles, Nourse, Mason & Co., at Worcester, Mass. for the New-England States. By Seymour, Morgan & Co., Brockport, N. Y., for Illinois, Iowa and Michigan. By Warder & Brokaw, Springfield, O., for Ohio and Kentucky.

31-39

SALE OF STOCK.

PURE BRED STOCK AT PRIVATE SALE AT MOUNT Fordham, Westchester Co., New-York, Eleven Miles from City Hall, N. Y., by Harlem Railroad Cars.

Having met with more success than I anticipated the past year, with the Catalogue of male animals at Private sale, is the reason for offering this lot of animals, AND MY JUNE SALE BY AUCTION, WILL NOT TAKE PLACE. A full descriptive Catalogue with prices attached, will be published on the fifteenth of April, and I intend to be at home myself to see that my Catalogue, I will send, and a yearling sale, about 18

Short-Horns, 6 of which are young Bulls and Bull Calves. The Cows and Heifers old enough, will be in calf, to the Celebrated Imported Bull "BALCO," (9918) or Imported, "ROMEO," winner of the first Prize at Saratoga, in 1853; and also at American Institute the same year.

The young Bulls and Bull Calves, are some of them from imported Cows, and sired in England, and others are sired by Cows of my Importations, will also sell a lot of the first Prize at Saratoga, the past year, as a two year old.

Also, about 10 head of Devons, consisting of a yearling Bull, sired by MAJOR, and 5 Bull Calves, sired by my imported first Prize Bull, FRANK QUARTLY, and several of them from imported Cows and Heifers old enough, will be in calf to FRANK QUARTLY. Also 6 or 8 Suffolk Sows; and several young Suffolk and Essex Boars. Also, 2 South-down Rams, bred by me, from Jonas Webb, and 6 Yearling Rams, all bred by me, from Stock on both sides, imported from Jonas Webb. Catalogues will be forwarded by Mail if desired.

All Animals delivered on SHIPBOARD, or RAIL CAR in the City of New-York, free of expense to the purchaser. The Devons are at my Herdsdale Farm, 12 miles north, to which place I will take persons both to and from.

MY FRIEND MR. N. J. BECAR, who is interested in several of my Importations, will also sell a lot of 10 head of Short-Horns, consisting of 4 young Bulls, and 5 or 6 Females. His young Bulls are also several of them from imported Cows, and sired by the LORD OF ERYHOLMNE, (12205), and the celebrated first Prize Imported Bull ROMEO. Mr. Becar's Cows and Heifers are in calf to the imported Bull, MARQUIS OF CARABAS, (12789). Mr. Becar can be seen at his Store, No. 187 Broadway, New-York, at which place he will make arrangements to go to his Farm, at Smithton, Long Island. His animals will be entered in the same Catalogue with mine, which can be obtained by addressing him at his Store, or me at Mount Fordham. His animals will be delivered in the same manner as mine. Our Importations have been in almost all cases made at the same time, and are of equal merit, excepting that I have more in number.

MORRIS FEMALE INSTITUTE.

THIS INSTITUTION IS SITUATED AT MORRISTOWN, N. J., about an hour and a half's ride from the city of New-York, on the Morris and Essex railroad; the cars leaving New-York several times a day. It has been ably patronized for the last six years. There will be a vacancy for a few more pupils in April.

Faithful teachers are provided for English branches usually required; also Drawing and Painting, French, Latin, and Spanish under a native teacher.

Vocal and instrumental music by an accomplished player, whose time and attention has been for years devoted exclusively to this object.

Further particulars, and circulars, may be obtained by applying to J. A. SEELEY, Principal, or at the book-store of Messrs. C. Shepard & Co., 152 Fulton street, near Broadway, or at this office.

Persons wishing to send their daughters from home, would do well to visit this Institution before deciding. 27-tf

MUSQUIT GRASS.

THE TRUE MUSQUIT GRASS, GROWN BY A CAREFUL Georgia Planter. This has proved the most sure and valuable grass for stock yet cultivated at the South, and is invaluable to the planter.

For sale by RICHARD PETERS, Atlanta, Ga., also by R. L. ALLEN, 189 and 191 Water St., N.Y. 27-tf

NO. 1 SUPERPHOSPHATE OF LIME.—THIS VALUABLE fertilizer has been used for several years in England and other parts of Europe, and, next to Guano, holds the highest rank in popularity, and the extent to which it is used among farmers. Its introduction in this country has been more recent; but the progress it has made in the estimation of the public has not been less marked or successful than abroad. It is now extensively used throughout the Northern States, after a full trial and investigation of its merits; and it is rapidly becoming, like its predecessor, Guano, a favorite manure at the South and West.

It is composed of refuse of ground bones, decomposed by the addition of about one fifth their weight of sulphuric acid, diluted with water, to which is added a due proportion of guano and sulphate of ammonia. The latter is the active and one of the most efficient agents in the best Peruvian Guano.

It is suited to any soil in which there is not already a full supply of the phosphates, which is seldom the case. All crops are benefited by its application.

For sale in large or small quantities, in bags of 150 lbs. each. No charge for packages. All bags will be branded "C. B. De Burge, No. 1 Superphosphate of Lime."

PERUVIAN GUANO of best quality. AGRICULTURAL AND HORTICULTURAL IMPLEMENTS of all kinds.

FIELD AND GARDEN SEEDS, of various sorts, fresh home grown and imported.

THE AMERICAN AGRICULTURIST—weekly, \$1 per volume—two volumes a year.

For sale at R. L. ALLEN'S Agricultural Warehouse and seed Store, 189 and 191 Water street, New-York. 25-tf

ATKINS' SELF-RAKING REAPER.—40 of these machines were used last harvest in grass or grain or both, with almost uniformly good success, in nine different States and Canada. TWENTY-SIX PREMIUMS, including two at the Crystal Palace, (silver and bronze medals,) were awarded it at the autumn exhibitions. I am building only 500, which are being rapidly ordered. Mr. Joseph Hall, Rochester, N. Y., will also build a few. Early orders necessary to insure a reaper.

Price at Chicago \$175-\$75 Cash with order, note for \$50, payable when reaper works successfully, and another for \$50, payable 1st December next with interest. Or \$160 cash in advance. Warranted to be a good Self-Raking Reaper.

Agents properly recommended and wanted throughout the country. Experienced agents preferred. It is important this year to have the machines widely scattered.

Descriptive circulars with cuts, and giving impartially the difficulties as well as successes of the reaper, mailed to post-paid applications. J. S. WRIGHT.

"Prairie Farmer" Warehouses, Chicago, Feb., 1854. 23-35

GARDENER FOR THE GREEN-HOUSE AND GRAPE-HOUSE.—Wanted a Gardener as above, who is experienced in the management of the Green and Grape-House in the United States. None need apply except fully qualified. 22-tf A. B. ALLEN, 189 Water st.

GARDEN IMPLEMENTS.

HEDGE, LONG-HANDLE, AND SLIDING PRUNING SHEARS; Budding and Edging Knives; Pruning Hatchets, saws and knives; pruning, vine and flower scissors; bill and Milton hooks; lawn and garden rakes; garden scuffers, hoes of great variety, shovels and spades; hand engines, which throw water of forty feet or more, syringes and water pots; grafting chisels, treecrappers, and caterpillar brushes; transplanting trowels, reels; hand plow and cultivator, very useful to work between rows of vegetables, together with a large assortment of other implements too numerous to mention. [21tf] R. L. ALLEN, 189 and 191 Water-st.

FOR SALE AT THE SOUTH NORWALK NURSERY, THE Great New Rochelle or Lawton Blackberry Plants; also plants of the White fruit Blackberry. For sale also a large stock of small plants of the new or North River Red Antwerp plants, at the low price of fifteen dollars per thousand. The above plants all warranted.

24-36

GEO. SEYMOUR & CO., South Norwalk Nursery, Conn.

POUDRETTE.

THE LODI MANUFACTURING COMPANY OFFER their Poudrette for sale in lots to suit purchasers, from a single barrel up to 4000 barrels, at their usual rates, \$1.50 per barrel for any quantity over seven barrels, delivered on board of vessel in the city of N. York, free of cartage or other charge. When 200 or 300 barrels are taken, a deduction will be made from the above price. That this article has stood the test of fourteen years trial is proof of its efficacy. It is the cheapest and best manure for corn ever produced, and it has the advantage of being useful in small quantities and harmless in large. It is a capital manure for peas, strawberries, &c., and all garden vegetables. Apply by letter or personally to the Lodi Manufacturing Company, 74 Cortlandt st., New-York. 22-34

AGRICULTURAL IMPLEMENTS.

AGRICULTURAL IMPLEMENTS.—THE SUBSCRIBER keeps constantly on hand, and offers for sale the following valuable implements:

Fan Mills of various kinds, for rice as well as wheat, rye, &c. Grain Drills, a machine which every large grain planter should possess. They are of the best patterns, embracing most valuable improvements.

Smut Machines, Pilkington's, the most approved for general use.

Hay and Cotton Presses—Bullock's progressive power-presses, combining improvements which make them by far the best in use.

Grain mills, corn and cob crushers, a very large assortment of the best and latest improved kinds.

Horse Powers of all kinds, guaranteed the best in the United States. These embrace—1st, The Chain Power, of my own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, and economy. They are universally approved wherever they have been tried. 2d, The Bogardus power, for one to four horses. These are compact, and wholly of iron, and adapted to all kinds of work. 3d, Eddy's Circular Wrought Iron Power, large cog-wheels, one to six horses, a new and favorite power. 4th, Trimble's Iron-Sweep Power, for one to four horses. 5th, Warren's Iron-Sweep Power, for one or two horses.

GRAIN MILLS, STEEL AND CAST IRON MILLS, AT \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES.—FOR MAKING DRAINING TILES OF all descriptions and sizes.

WATER RAMS, SUCTION, FORCE, AND ENDLESS-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL KINDS, MADE EXPRESSLY for the California and Oregon Markets.

DRAINING TILES OF ALL FORMS AND SIZES.

CLOVER AND TIMOTHY SEED HARVESTER.—A newly-patented machine, will harvest 10 or 12 acres per day with one horse.

HAY AND COTTON PRESSES.—BULLOCK'S PROGRESSIVE Power Presses, combining improvements which make them by far the best in use.

THRESHERS AND FANNING-MILLS COMBINED—OF Three Sizes and Prices, requiring from two to eight horses to drive them, with corresponding horse powers. These are the latest improved patterns in the United States.

SOUTHERN PLOWS—Nos. 10 1/4, 11 1/4, 12 1/2, 14, 15, 18, 18 1/2, 19, 19 1/2, 20, A 1, A 3, 50, 60, and all other sizes.

CORN-SHELLERS, HAY, STRAW, AND STALK-CUTTERS, Fanning-Mills, &c., of all sizes.

HAIR RESTORERS, &c.

BARKER'S CHEVEUXTONIQUE.—THIS IS AN ENTIRELY new article, concocted for the purpose of Preserving, Restoring, and Beautifying the Hair, and unlike most preparations designed for the same objects, it is free from all grease, so that its application cannot soil the most delicate fabric. As an eradicator of Dandruff, it is unequalled, while its infallibility in cases of headache, causing the most violent in a few moments, cannot fail to commend it to universal appreciation. The Cheveux-tonique is for sale by all the respectable druggists and fancy stores throughout the city. The depot for its sale, wholesale and retail, is at BARKER'S Ladies' Hair-dressing Establishment, No. 423 Broadway. 2-45

HORTICULTURAL.

FRUIT AND ORNAMENTAL TREES AND PLANTS.—Including every thing necessary to the Garden, Green-house, Nursery, and Orchard, with all the recent introductions, at very low rates. Descriptive price Catalogues gratis. Carriage paid to New-York. Ornamental and other planting done in any part of the country. The best season for transplanting is after Oct. 10. Address B. M. WATSON, Old Colony Nurseries, Plymouth, Mass. 8-59

WACHUSSETT GARDEN AND NURSERIES.

NEW-BEDFORD, MASS., ANTHONY & MCAFEE, PROPRIETORS Successors to Henry H. Crapo, would invite the attention of the public to their extensive stock of Fruit and Ornamental Trees, Flowering Shrubs, Rose Bushes, &c., Evergreens, Balsam Fir, American and Chinese Arbor Vitae, Cedrus Decidara, Cryptomeria Japonica, Norway Spruce, Yew Trees, Tree Box, &c., an extensive assortment of Apple, Pear, Plum, Cherry, Peach and Apricot Trees.

The stock of Pear Trees is very large, both on Pear and Portugal Quince Stocks, embracing every thing worthy of cultivation. All our Pear Trees are propagated and grown by ourselves, and

WARRANTED TRUE TO NAME.

The soil, climate, &c., of this locality being so favorable to the Pear, our trees are unrivalled for health, vigor of growth, &c., &c.

They are all free from that destructive malady

THE PEAR BLIGHT,

which has never existed in this locality. Prices low, and a liberal discount to the trade.

New-Bedford, Jan. 1st, 1854. 17-68

HOUSE-FURNISHING.

CHIMNEY TOPS, MADE BY THE GARNKIRK COMPANY. Encaustic Tiles for floors, Vases and Statuary for lawns and gardens, &c., for sale by

MILLER, COATES & YOUNG, 279 Pearl street. 2-32

IRON BEDSTADS VS. BEDBUGS!—500 IRON BEDSTADS, which fold to occupy the space of a chair, 500 Iron Sitters, proof against Yankee knives. Iron Chairs, Iron Hat Stands, and all kinds of Ornamental Iron Furniture, bronzed in a most beautiful manner. All kinds of Iron Fence and Verandah Work, made at very low rates. G. MAURER, Manufacturer, 178 William street, between Beekman and Spruce, N. Y. 2-56

LIVERY STABLES.

NORTHUP & POST'S DROVE AND SALE STABLES, corner of Third Avenue and Twenty-fourth street, New-York. The subscribers, formerly proprietors of the Rose Hill Stables, respectfully announce to their former patrons and the public generally, that they have taken the five new fire-proof brick stables, capable of holding 300 horses, directly opposite the Bull's Head Hotel, and, by their efforts to please, hope to receive a fair share of that patronage which they so strongly solicit.

New-York, April 1st, 1853. R. K. NORTHUP, N. POST.

N. B.—New wagons and harness for the accommodation of their customers. 1-34

CONCKLIN & HUGG, LIVERY STABLES, NOS. 63 & 65 Twenty-fourth street, between Lexington and Third Avenues, (Office on Twenty-fourth street,) New-York.—Coaches, Light Wagons, and Horses to let on most reasonable terms. Horses kept by the day, week, or month. 1-40

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master, and ask him to mark the envelope, *Registered by —, P. M.*

BACK NUMBERS are usually kept on hand, and when a subscription is sent without naming any date for commencing, the back numbers from the beginning of the current volume will be sent, unless as sometimes happens, an unusual rush of subscribers has exhausted the supply.

In writing, always give the Post-office (instead of the town) and the County and State. *Write these very plainly.*

Clubs may add to their number at the same rate per copy as was paid by the original members.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished with Harper's Magazine, one year for.....	\$4 00
" Putnam's do.....	4 00
" Knickerbocker do.....	4 00
" Eclectic do.....	6 00
" Little's Living Age do.....	6 50
" National Magazine do.....	3 50
" Dickens's Household Words.....	3 50

Address ALLEN & CO.,

J. A. GRAY, Printer, 95 and 97 Cliff street, N. Y.

PUBLISHERS' ANNOUNCEMENT!

Twelfth Volume of

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B. The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon its own merits; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammeled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDD, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers,	-	-	-	\$2.00 a year,	\$2.00
" Clubs of 3 do.	-	-	-	1.67	5.00
" do. 5 do.	-	-	-	1.60	8.00
" do. 10 do.	-	-	-	1.50	15.00
" do. 20 do.	-	-	-	1.25	25.00

The money always to accompany the names for which the paper is ordered.

The Post-Master, or other person sending a club of ten, will be entitled to one extra copy gratis. The Post-Master, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, *Weekly Tribune*, or *Weekly Times*, or any other paper or periodical in this city, not costing to exceed two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if enclosed and mailed in the presence of the Post-Master.

Communications for the paper should be addressed to the Editors; subscriptions, advertisements, and all matters relating to the business department, should be addressed to the Publishers,

AMERICAN AGRICULTURIST.

Designed to improve the Farmer, the Planter, and the Gardener.

AGRICULTURE IS THE MOST HEALTHY, THE MOST USEFUL, AND THE MOST NOBLE EMPLOYMENT OF MAN.—WASHINGTON.

PUBLISHED WEEKLY BY ALLEN & CO., 189 WATER ST.

VOL. XII.—NO. 9.]

NEW-YORK, WEDNESDAY, MAY 10, 1854.

[NEW SERIES.—NO. 35.]

FOR PROSPECTUS, TERMS, &c.,

SEE LAST PAGE.

AGRICULTURE IN MINNESOTA.

WE have received a visit from a resident of St. Anthony, in this new territory, and gleaned from him the following information concerning its climate, soil, and productions. St. Anthony's Falls have long been known to geographers as upon the upper waters of the Mississippi, far beyond the outskirts of civilization. It was dream-land to us when a school-boy, a quarter of a century ago, and we never expected to see a citizen of a village of thousands of inhabitants, located within the roar of its waters. Already the water is partially appropriated, and is driving saw-mills and grist-mills, turning out lumber, and meal, and flour for the inhabitants of a rising State. It was not till 1849 that this territory was organized, and yet it has already a large population, principally from New-England, who are planting there the Puritan institutions of the East. St. Anthony has six organized churches, and the university of the State has been located at this place. Congress appropriated twenty thousand acres of land for its support. A building has been erected by private subscription for school purposes, which it is expected will grow into a college.

The village is about in the latitude of northern Vermont, and the extremes of cold are as great as in New-England, but the atmosphere is more dry, and more favorable to health. Colds are not so prevalent, and the climate is favorable to all affections of the lungs. The thermometer one morning the last winter stood at thirty-five degrees below zero. In summer it goes up to over ninety.

The spring comes on very rapidly, and vegetation is more forward than in the same latitude in the east. The soil is a sandy loam, resting upon lime-rock. This rock underlies the whole region for hundreds of miles north and south, and may be found below the surface, from one, to one hundred feet. On the banks of the river, it crops out, presenting in some places a perpendicular face, in others, an alternation of rock and soil, the soil every where being covered with grass to the water's edge. Sand and vegetable matter enter largely into the composition of the soil, so that it immediately feels the influence of the sun, and brings forward vegetation very rapidly. The surface soil is from one to three feet deep. The river is full of islands, which are generally covered with wood. The prevailing timber upon the islands is cottonwood, elm, sugar-maple, bass-wood, and walnut. Back from the river the oak-openings are almost the only appearance of timber. These oaks are

scattered about upon the prairies, appearing more like an orchard than any feature in our landscape. A characteristic feature of Minnesota is its beautiful lakes. These are large and numerous, perfectly clear, apparently fed with living springs, and abounding with fish. The white fish and lake trout are among them.

The emigrants coming from the East, follow the habits in which they have been educated, and put in a crop of corn and potatoes when they first break up the soil. Wheat-growing, to which both soil and climate are admirably adapted, follows later. Large quantities are now raised of the usual farm crop, but so great is the tide of immigration pouring into the territory, that they do not supply the wants of the population. Large quantities of grain and meat are brought up the river. Besides salt provisions, large numbers of beef cattle are brought up for slaughtering. At all the landings upon the river, farm products bear a high price, so that the farmer can oftentimes pay for his farm in a single season.

The immigrants are principally men of small means, with their fortunes invested in their persons. The first effort of the new citizen is to get him a home. If he has any capital, he buys his quarter section of 160 acres or more, and pays for it. If destitute of capital, he takes from the land office a preëmption right for a quarter of a section, which secures him possession for one year. Even if he does not pay for his land the first year, the government is very lenient toward the first settler upon the soil, and he is seldom disturbed without an equivalent for all his improvements. The best lands are often all bought up by speculators in large quantities, and this is a great disadvantage to the actual settler. It gives him the second choice of the lands, and often prevents him from having neighbors. Those who arrive after him will prefer to go further inland, and buy at government prices, rather than buy of the speculators.

When the settler has possession of his land, he puts up a log house, the best his means afford. The logs are hewn upon two sides, and the crevices are stopped with sticks and mud. The chimney is made of stone, if that article is convenient, if not, the mud plaster supplies its place. Glass can be had in the villages, and a very few windows generally satisfy the settler for the first season.

Barns are very scarce. Hovels take their place, and as the prairie grass is very abundant, and to be had for the cutting; it is piled upon and around the hovels so as to make a very comfortable shelter for the stock. The first winter is usually spent in getting out rails and fencing stuff, to enclose the ground he purposes

to cultivate the next season. It is several years, usually, before the whole farm gets enclosed. The soil yields abundantly without manure. Three hundred bushels of potatoes are often raised to the acre, and as yet the rot has not troubled them. Pink-eyes, Irish greys, and the Chewangos are common varieties. Wheat, corn, and oats yield abundantly.

The unenclosed prairie is the pasture ground for all the stock of the settlement. As all the calves are raised, it is an easy matter to call the cows home to their stalls, by keeping the calves in the hovels through the first season. Many of the cows are furnished with bells so that they are easily reclaimed by their owners. The young stock wander off, and are often not seen by their owners for months. The sight of these large herds, feeding upon the luxuriant prairie, is one of the richest in Nature. It carries one back to the patriarchal age, when men numbered their flocks and herds by hundreds and thousands.

Some attention is already paid to fruit growing, and a nursery agent has established himself near St. Anthony. He is furnished with his stock from nurseries in Iowa, and sells at prices not very much in advance of the East. Young trees are set out, but not many of them are in bearing condition.

Wild fruits are abundant, especially upon the islands in the river.

A plum resembling the Damson is very common; grapes, crab apples, thimble berries, and raspberries are found in many localities. The crab apples are large, but are not improved in quality by their size. The wild grapes are not of better quality than those found with us.

To the New-Englander, Minnesota presents an inviting home, if he must leave his native soil. He will find there a more healthy climate than he leaves behind him, and a virgin soil yielding abundant crops. But it will be many years before he can surround himself with the many social comforts and privileges of the East. Of what avail is it that he gains a superfluity of the raw materials of comfort for his body, if he must live years in a log house, and be deprived of the school and meeting-house—those land marks of New-England? Why seek a richer soil when the wealth of his own soil, amid the institutions dearest to his heart, is not yet half developed? The industrious man, with a good house and a few acres around him, may support himself and family in comfort where he now is, ordinarily, with more ease than to seek a new home in the West. But the Yankee must move. Necessity is laid upon him to push off into the wilderness, and if he will leave us, we can only say to him, "Minnesota is a goodly land. Go up and possess it."

ON FEEDING POULTRY.

WE take the following article on feeding from the *Poultry Chronicle*. What the writer says in respect to Indian corn and rice, may answer for England, but long experience in this country proves them to be among the best kinds of feed we can give to our poultry.

In August, one year, we shut up a lot of hens to fat, in a roomy stable with a plank floor. We gave them nothing but Indian corn for their food, and as much of it as they pleased to eat. We also gave them clean, fresh water in abundance daily, and fresh gravel. In three weeks we killed the lot, and saving that they were a little too fat, we never eat better poultry. The hens were full of eggs. Had they been kept one week longer, we think they would have laid abundantly; still, for fattening and laying, we would prefer to let the hens run at large. The meat is leaner, more juicy and tender for it. Indian corn is better cracked than fed whole; and it is very well to mix oats, barley, buckwheat, and sunflower seed with it. Rye, wheat, and rice are very good, but generally more expensive with us than the other kinds of grain mentioned. We like the idea as suggested by the writer of scattering the grain well over the ground, so that it will take some time for the fowls to pick it up, and they cannot then gorge themselves to their injury.

If you go to a physician to consult him for a disordered stomach, he inquires your habits, and particularly your diet, and manner of eating. From defects in these, he finds the origin of your disease, and for its cure he inculcates a new and better system. When men lived in a state of nature, ailments were less numerous; and so it is with poultry. In a natural state, they have few diseases; with us they have many, because we have forced them into an unnatural state of life. We would then trace them to bad feeding, and would also, by plain suggestions, point out a cure.

Pheasants, wild fowl, and poultry, where they are wild, as in India, are always healthy, and the scars and seams, well known to all those who are in the habit of plucking them, testify to the condition that enables them to recover from the most serious wounds. Our feeding, then, should most resemble that of wild bird, if we would seek the same result both in condition and feather. We should also seek to give the same food as the bird would find if left to its own resources.

The faults of modern feeding are, giving meat—feeding out of vessels of any description—throwing down large heaps of food, irregularly—and too often the substitution of any thing that is cheap for that which is wholesome.

Meat is an unnatural food for poultry. It was extensively given during the Cochon mania, in order to make weight; and many are the buyers who have paid from ten to twenty pounds each for very heavy hens, so unnaturally fattened by this process, that they could never lay a perfect egg, and numbers died in the attempt. A fowl is not provided with digestive organs for meat.

In a state of nature, fowls run over a great extent of ground before they get a crop-full. They pick up food grain by grain, and with it small pieces of dirt, blades of grass, and other things, that all help digestion. What, then, can be said of the various feeders in use? Placed before the fowls filled with barley, the birds do in five minutes that which should be the work of two hours; they eat a greedy fill, and suffering from unnatural repletion, they have recourse to drink. The corn swells in the crop, and the sufferers, instead of walking cheerfully about, hide in corners, and squat about to the detriment of their health. This applies to the

equally bad practice of throwing down the food in heaps.

Irregularity.—In a natural state at break of day, all birds are in search of food, and they find it. What an evil it is, then, for them to be fed one day at seven, next day at nine, and sometimes not till mid-day. A still greater evil is, to endeavor to make up for previous neglect by an extra quantity.

Among the improper food given to fowls we include two rather popular articles, viz., Indian corn and rice. We can only add, we have tried both; the former makes fowls extremely fat, but it makes no flesh. We consider the latter worthless, as we have tried it to our cost; and we have no hesitation in saying, no good is ever done either in condition or feather, when the birds are fed with it.

Having disposed of our complaints, we will now endeavor to point out a better plan for general feeding, not with a view to fattening or extra condition, but to keep a yard in really good plight.

They must be out at daybreak, and should be fed directly with oatmeal slaked, and thrown down to them. Let it be so mixed, that when cast down, it will crumble. As soon as they cease to run after it, leave off feeding. At mid-day, give some whole corn, wheat is best, but throw it as far, and scatter it as much as you can—throw it among the grass; you will see the fowls spreading about in a natural way, and seeking the stray grains. In the afternoon, feed again as in the morning. Our system then is, regular feeding three times per day, and no food, save what they can find, at any other time. It will cost no more than the systems we have blamed, and the condition of the fowls will amply compensate for the little extra trouble.

H. R.

NITRATE OF SODA.

THE following remarks on this fertilizer, are extracted from an address by Dr. ANDERSON, before the Highland Agricultural Society.

I presume all my audience are aware that by the use of no more than 42 lbs. per acre, Mr. Pusey obtained an increase of 7 bushels of barley, or more than four times the value of the manure. I need scarcely say that the experience of many farmers in this neighborhood has clearly established the value of nitrate of soda as a top-dressing for grass lands; in general, however, it has been employed in larger quantity, (1½ to 2 cwt. per acre), and the application of two-thirds cwt. by Mr. Main is, so far as I know, the smallest recorded except Mr. Pusey's. In a subsequent paper, on the natural law by which cubic nitre acts as a manure, Mr. Pusey enters on more difficult ground. In regard to it, I may observe in the first place, that a very curious misapprehension seems to have existed as to the views entertained by chemists regarding the source of the value of nitrate of soda, and it has been asserted that they still considered it uncertain whether that manure acted by virtue of its nitric acid or its soda. I think it right distinctly to contradict this statement. The strict retainers of the Giessen School of Chemistry may possibly still entertain such doubts, but I apprehend, that if Mr. Pusey had put the question to any agricultural chemist, he would have received for reply that it was most unequivocally due to the nitric acid, and not to the soda. It has, however, always been considered doubtful whether the nitric acid is assimilated directly by the plant or is first converted into ammonia, which we know it very readily is; that, however, is an entirely different question on which experiment has not as yet thrown the slightest gleam of light, and which will probably continue long undecided. As far as the question of the constituent on which the value of nitrate of soda depends is concerned, it must be considered as having been entirely set at rest 10 years since, by the experiments of Kuhlman, who showed that nitrate of lime produced the same effects; and the ex-

periment paper, though sufficiently interesting in other respects, was quite unnecessary. As the result of the experiments contained in his papers, Mr. Pusey has deduced as a natural law, that "substances strengthen vegetation, mainly by their contents of nitrogen." But in this there is nothing new; it is exactly what chemists have over and over again asserted, except that they have not gone by any means so far; and while attributing a preëminence to nitrogen, have not failed to point out the importance of other substances. But when we come to consider the matter in all its details, there are other points not referred to by Mr. Pusey, which deserve attention. The experiments of Kuhlman were made for the purpose of contrasting the value of nitrogen in different forms, and the substances used were sulphate and muriate of ammonia, nitrate of soda, Peruvian guano, and the gelatine of bones. The result was, that for every 100 lbs. of nitrogen contained in the manure, there was obtained an increased produce in round numbers of 300 lbs. of hay with the salts of ammonia, of 500 lbs. with nitrate of soda, while with Peruvian guano there was in one case an increase of about \$500, and in another of no less than 16,000 lbs. of hay for the same quantity of nitrogen. The gelatine gave nearly the same increase as the ammonia salts. These results are still more striking when we observe the effect on the subsequent crops; for with the salts of ammonia and nitrate of soda, the effect was not only entirely exhausted on the first crops, but that immediately following was actually diminished, while with Peruvian guano and gelatine, the increase was spread over several years. Nor is there anything unintelligible in this result; guano gives to the soil much more than nitrogen, it supplies phosphoric acid and the alkalies, and hence, theoretically, ought to produce a higher effect. Such are the results of Kuhlman's experiments.

They support fully Mr. Pusey's opinion as to the value of nitrate of soda, but they are totally at variance with that law which Mr. Pusey tells us we may now adopt with unhesitating certainty, namely, that substances strengthen vegetation mainly by their contents of nitrogen; for we perceive that nitrate of soda surpasses sulphate of ammonia in the ratio of 5 to 3, while it their action was merely dependent on their nitrogen, they ought to produce the same effect. Further, a quantity of guano produces in one experiment three, and in another five times the effect of sulphate of ammonia, a difference which can only be attributed to the other constituents of the guano. I have mentioned these experiments, not with the view of throwing any doubts on the advantages derived from the use of nitrate of soda, for on that point there can be no question, but rather as a caution against the too hasty adoption of that law, which Mr. Pusey says we may now assume with unhesitating certainty, and to show that there are many points regarding its use on which we still require experimental evidence. So far from supporting Mr. Pusey's law, those experiments rather point towards a view which at a monthly meeting of the society, some two or three years since, I suggested as deserving experimental inquiry, but which, much to my regret, has not yet been taken up. I believe the facts at present known tend to show that, while nitrate of soda exerts a marked influence upon the growth of the great family of graminaceous plants, it is nearly or altogether without effect upon roots and clover, and I suggested that just as there are two classes of animals, carnivorous and herbivorous, so there might possibly be two classes of plants capable of deriving their nitrogenous constituents from different sources, one assimilating it chiefly or only from ammonia, the other possessing in addition the power of elaborating it from nitric acid. This view derives some support from the recent experiments of Wolff, which have shown that the nitrates which act powerfully upon barley are almost without effect upon tares. It must be understood, however, that I throw out this merely as

a suggestion, to be confirmed or refuted by experiment.

From the Mark Lane Express.

RESOURCES FOR BREEDING HORSES.

HAVING in a previous communication shown that our horses have not deteriorated in respect to blood and performances, I will now proceed to consider how their superiority may be continued, confining my observations to those subjects which apply to breeding hunters, roadsters, and carriage horses. For these purposes, but especially for the two former classes, recourse must be had to stallions which have been bred for the turf; and although it is not imperative, or in all cases advisable, that the mare should be thorough-bred, it is essential that the sire should be. Here, however, I must introduce the suggestion, that there can be no objection to a powerful short-legged thorough-bred mare with hunting action, if such an animal can be obtained at a reasonable price. Breeders of all kinds of animals are aware that when a cross of what may be termed plebeian blood is resorted to, the stain should be in the dam, and that the male should be of the higher class. The superiority of the progeny arising from this system was clearly demonstrated some years since. The stallions to be selected should be those with good legs and feet, sound constitutions, strong backs and loins, with prominent hips, muscular thighs, and perfectly defined hocks; the shoulders being so intimately connected with the action of the fore-legs, demand the most positive scrutiny, and temper is an attribute not to be disregarded. Color may also be a consideration—not forgetting to ascertain what may have prevailed among the ancestors. A horse that has signalized himself by winning his races when the ground has been deep, is greatly to be preferred, for the purpose now under consideration, to one which could only run when the course was dry, although the former may not have won more than two or three races during his career, and the latter twenty. This circumstance will generally influence the breeders of racing stock, who selecting the one which has won the most races, and beaten the most superior competitors, leaves the other at the service of those who confine their breeding to less aristocratic pretensions. Perhaps it may be observed that there are very few stallions in which are combined all the good qualities I have enumerated; but there are some; they should be extensively patronized, and that would be the best security against their being sent abroad. It is too frequently the parsimonious saving of breeders which leads to that event. While in every department of a breeding establishment it is necessary to practise economy in the true acceptance of the term, it is equally important to avoid penurious extremes, which must eventually lead to disappointment and loss. Every man should determine upon giving a fair price for a fair commodity; and as every man who breeds hunters expects to realize a good price for a good horse, he should not be niggardly of the sum which he pays for the services of that animal which is to be the progenitor of his future hope. Rather than expend three sovereigns for the services of a superior stallion, many persons will put their mares to any wretch, if the owner will accommodate them for a mere nominal remuneration. This is the frequent cause of useful horses being sent out of the country. It cannot be expected that the owner of a valuable animal will refuse the offer of a high price from a foreigner, unless he can fairly calculate upon realizing an equivalent sum by keeping his horse at home.

To secure stallions of repute, farmers would find it advantageous if they would unite, and signify their determination to patronise those of character. An extra sovereign or two is of no importance to an individual, more especially when he reasonably anticipates a return of his money; but when a number of persons contribute their one or two sovereigns, it becomes an object of

great importance to the recipient. The introduction of Arabian blood has been recommended, as calculated to correct the evils which are alleged against the horses of the present day. The argument held is, that in "the early days of racing the large importations of good Arabs—followed as they were by a careful and continuous selection, not for one good quality, but for a fine union of qualities—succeeded for many years in producing, both for the turf and all useful and pleasurable purposes, the best saddle-horses in the world." I have clearly shown that the horses of the present day are far superior to those of the time referred to. Going back to Arabian blood would be like putting a child back to his alphabet after he had gained proficiency in spelling. The advocate of the Arabian states that "most of the Arab horses which have of late years come to this country have not been of the first class;" and also that "they can only run at their full stretch for about half a mile." There is no doubt that the horses that have been imported have been the best that could be procured; and the fact of their not being able to run more than half a mile is an admission that our race-horses are far superior to them in running distances. Apart from racing, for hunting purposes a cross from the Arab is worthless, which I have seen in several instances. Animals bred in that manner are proverbially soft, and of delicate constitutions. For breeding hacks, if they are only to be required for parade, selecting very handsome Galloway mares about fourteen hands high, the services of a clever Arabian may be admitted, but for no other kind of horse.

If it is desired to breed large powerful carriage horses, a very active short-legged Cleveland horse may be most suitable; but he should be one of extraordinary perfection.

Unfortunately, many persons who enter into the speculation of breeding are not sufficiently good judges of the points and merits of horses, and thus they are often led into the error of putting their mares to unsuitable stallions at a low price. Not being able to distinguish the difference of blood, constitution, shape, and action between the one whose covering price is three sovereigns and the other whose price is one sovereign, they only regard the saving of their money, without reference to future prospects. It is to be hoped the Royal Agricultural Society will take the subject into consideration; they have it in their power to advance the interests of breeds of horses very materially; and I doubt whether it can be done more effectually than by offering liberal prizes for the produce of certain stallions which, having been exhibited, shall be approved by the judges. It would be a means of assisting inexperienced breeders in their selections. They would naturally send their mares to those stallions, in the hope of gaining the prizes for their produce; but it should be a condition that the stallion so chosen should be restricted to covering mares not thorough-bred for a certain sum, I think not exceeding three sovereigns. Comparing the value of the prizes offered by the Royal Agricultural Society—when the meeting took place at Gloucester—for other kinds of farming stock with those for horses, especially of the roadster class, it would appear that such animals are considered unworthy of encouragement. For three different breeds of bulls £40 each were given; but for the best roadster stallion only £15. Young bulls, cows, and heifers in milk or in calf, and yearlings heifers of the three kinds, were liberally rewarded with prizes, and likewise old and young stallions, fillies, and brood mares and foals for agricultural purposes; but there was not one prize for young stallions, fillies, or brood mares of the roadster class, which, if judiciously managed, is the most profitable stock a farmer can raise.

The next consideration—and that is a most essential one—is the method of keeping foals after weaning them; it is a rock upon which so many breeders have foundered. Having weaned their foals, they consider nothing more is neces-

sary for them but grass, and that at a time of year when it is sour and contains very little nutriment. On the importance of this subject, I make an extract from a letter by a friend, who heard that I had very recently visited a breeding establishment which some years since was in very high repute. To give additional weight to the remark, I must state that my friend is a member of the Veterinary College, and for thirty-seven years had the superintendence of the first stud in England. He writes—"From ignorance in forming the plan, the grass is now so rank and sour that there are complaints of worms, &c., instead of praising, as was formerly the case, the keep of the paddocks." Much of the success or disappointment attendant on breeding horses turns upon the choice of appropriate food, which requires occasionally to be varied. The growth of animals, the development of muscles, and the texture of bones and sinews, depend greatly upon the food with which they are supplied. I am not about to recommend such nutriment as may be conducive to the production of fat, but such as will supply the blood with the elements of muscle, bone, and sinew; for these are the substances which render the horse valuable. To this purpose a moderate allowance of corn and hay is imperative. First-rate hunters and hacks cannot be reared without it. The proportions may vary, as the constitutions of all animals are not alike, and circumstances will sometimes produce unexpected changes. It is in the judicious observance of these matters that the talent of the breeder is exemplified, and his success will to a great extent depend upon his discrimination. When a horse appears too fat, it is a certain indication that the food which he receives abounds in particles having the property of forming that substance; in which case it should be changed, and the quantity diminished.

In some cases it will happen that a horse does not generate a sufficiency of fat, for a certain portion is as necessary to health as an overabundance is prejudicial. This may arise from indigestion, the bad quality of the food, or its not being suitable to the constitution. If indigestion be the cause, the nature of the complaint should be ascertained, and suitable remedies administered. Should it be decided that the quality of the food is bad, the alternative is obvious. Relaxation of the bowels will cause horses to lose their flesh; and so will the opposite condition—constipation. These complaints will frequently have their origin from the food not being suitable to the constitution, and therefore a change is necessary. These may be considered trifles; but when it is observed that relaxation of the bowels, and also constipation, in foals and young horses, if neglected, often becomes constitutional, that impression must cease. In the management of thorough-bred stock, every effort is exerted by giving them good food to bring them forward, so that they may run at two years old. It would be out of character, on this occasion, to enter into any arguments for or against the practice of running them at such an early age; but I may remark that every farmer is aware of the profit and advantages of making his oxen and his sheep ready for the butcher at the earliest period possible; and that is accomplished by selecting those breeds which are celebrated for the purpose, and supplying them at an early age with suitable food. By judicious treatment the horse may likewise be brought forward in his stamina and condition, by which means a four-years-old will be as forward as a five-years-old that has been neglected, and this may be termed the economy of breeding. To explain myself more clearly, we will suppose two colts are taken from their dams in October; one shall have two feeds of corn per diem, a bran mash once a week, and occasionally a few swedes, according to the state of the bowels, four or five pounds of hay, a small paddock or yard to run into, with a hovel for shelter at night and when the weather is unfavorable; the other to be turned into a meadow where the grass is up

to his knees, but which is necessarily sour, containing very little nourishment, and which will probably engender worms. When frost and snow commence, he will be accommodated with an asylum in the farm-yard, where he will be driven about by the cows, perchance gored by their horns when picking a mouthful of barley straw or indifferent hay from the cribs which the jealous cows aforesaid wisely consider their just and exclusive prerogative. In March or April this colt is probably allowed the range of some meadow or pasture land, when, by meeting the young grass as it springs, he occasions damage to the future crop, and the succulent herbage relaxes his bowels. In May he appears a poor, weakly, mis-shapen, dejected object, pot-bellied, and looking as if he had been starved, which, in point of fact, is nearly true, although he has eaten or destroyed keep which might have been more profitably consumed in other ways. Now let us consider the one which has been properly treated; he will be found to look kind and healthy; having been sheltered from the elements he will be robust, and exhibit a fair proportion of muscle, and he will be playful and full of spirits. But, then, the opponents to this course will exclaim, he has cost so much more to keep him. Let us therefore ascertain to what extent. From October the 15th to May the 13th is thirty weeks. Two feeds of corn per diem, or a bushel per week, at three shillings, amount to £4 10s., at which price they may be bought, although when consuming the produce off the land on the farm, it ought only to be estimated at the cost of growing it. Half-a-hundred weight of hay per week, at £3 per ton, £2 5s. Bran mashes and swedes, 5s.; in all, £7. The valuable manure that will be made is equivalent to the extra attendance. The half-starved animal will consume or waste more hay; but we will estimate at the same amount—£2. The injury that he will do to the spring grass by meeting the keep and poaching the land cannot be valued at less than 10s.; total, £2 10s., making a difference of £4 10s. But what would be the relative value of the two animals if offered for sale? much more than the difference in the keep. To sell at this early age, however, is not the object; it has therefore to be considered which will make the most valuable horse at four or five years old—one which has had every opportunity for establishing a healthy, vigorous constitution, or one which having been badly kept in its youth will grow up to be a puny, badly-shaped, infirm animal. It is the latter mode or rearing them which produces so many horses of little value, and which has led to the impression, that the breed of saddle horses has deteriorated. We have plenty of good material to work upon, if that material is properly manufactured. A superficial observer comes to the conclusion, when he visits a large fair, that there are very few good horses to be met with, because all the rubbish is taken to that market; but those which have been more judiciously managed by breeders who have acquired fame, are eagerly sought for by dealers and others, who go to the farms where they are bred, and there make their purchases. Those horses are never seen at the public fairs at all.

There are so many little items connected with rearing horses which may appear trivial in detail, yet are collectively important, that it becomes necessary to mention some of the most essential. When a foal is taken from its dam, the loss it sustains from being deprived of its mother's milk is considerable; that must be met by offering nourishing food, consisting of oats, which should be bruized, occasionally bran mashes; the addition of a little boiled linseed in the water is highly beneficial. As it is used on many farms for feeding fat stock and other cattle, there cannot be much trouble or expense in supplying the small portion requisite to the young foals. Shelter is of great consequence at all seasons, especially during the fall of rain. The texture of the coats of young horses is of that nature, that when it

once becomes wet it is a long time getting dry again, more especially in the winter season. During the process of drying, the evaporation which takes place very materially reduces the quantity of nutriment contained in the blood destined to form fat and muscle on the growing frame, and thus much of the benefit to be expected from the food which the animal consumes is wasted. Colds taken at an early age are calculated to injure the constitutions of young horses to a considerable extent. Some persons urge that horses should be brought up without attention to such matters, in order to render them hardy; but a moment's reflection will decide which of the two is most likely to constitute an animal which, having arrived at maturity, is required to be in possession of his physical powers in the utmost state of development—one which has enjoyed uninterrupted health, or one which has been constantly in a state bordering upon disease. Although colds may be slight, when frequently repeated they become constitutional. Settling upon the lungs, they are often the origin of cutaneous disorders, swelled legs, blindness, and general debility. That organ being the medium through which the vital principle of the air is conveyed to the blood, its pure and healthy state, and consequently the general vigor of the animal, must be affected more or less by the condition of the lungs. When the trachea or windpipe is attacked by colds, and the membrane with which it is lined becomes inflamed, roaring is a frequent result; but it is a mistaken notion to suppose that malady ever proceeds from the lungs. Strangles, and the epidemic called "influenza," often occasion roaring, but more especially when the membrane lining the windpipe has become the seat of chronic inflammation produced by colds.

As I would urgently recommend that all horses should be sheltered from the inclemency of the elements, so would I as earnestly recommend that they should be allowed the free enjoyment of pure air when the weather permits; but for this purpose they should not be turned into wet foggy meadows, where the grass is rank and luxuriant. Small paddocks or yards are the most suitable during winter, or a dry upland pasture that has been eaten close by sheep; but the existing conveniences must in some measure regulate this event.

CULTIVATION OF FLAX FOR 1854.

THE following are directions for the cultivation and preparation of flax, which has been issued this spring to the Irish farmers, by Messrs. Leadbetter & Co., of Belfast:

Choice of Soil and Rotation—By attention and careful cultivation, good flax may be grown on various soils; but some are much better adapted for it than others. The best is a sound, dry, deep loam, with a clay sub-soil, or a light soil with clay sub-soil. It is very desirable that the land should be properly drained and sub-soiled, as, when it is saturated with either underground or surface water, good flax cannot be expected.

Without method there cannot be success; different soils require a difference of rotation. In the best soils of Flanders, flax is grown in the third year of a seven-course rotation, or the fifth year of a ten-course rotation. In Belgium it follows a crop of oats. It is a very general error among farmers to consider it necessary that flax should follow a potato crop. Except on very poor soils, a better crop will be produced after grain, and the double profit of the grain and flax secured. If old lea be broken up, and potatoes planted, followed by a grain crop, a very fine crop of flax may be obtained in the ensuing year.

Preparation of the Soil—One of the points of the greatest importance in the culture of flax, is by thorough draining, and by careful and repeated cleansing of the land from weeds, to place it in the finest, deepest, and cleanest state.

This will make room for the roots to penetrate, which they will often do, to a depth equal to one-half the length of the stem above ground.

After wheat, one plowing may be sufficient, on light, friable loam, but two are better; and, on stiff soils, three are advisable—one immediately after harvest, across the ridges, and two in spring, so as to be ready for sowing in the first or second week of April. Much will, of course, depend on the nature of the soil, and the knowledge and experience of the farmer. The land should be so drained and sub-soiled, that it can be sown in flats, which will give more even and much better crops. Sub-soiling should not be done at a less interval than two years prior to the flax crop. This gives the land time to consolidate. But until the system of thorough draining be general, it will be necessary, after oats, to plow early in autumn, to the depth of six or eight inches. Throw the land into ridges, that it may receive the frost and air; and make surface drains to carry off the rains of winter. If weeds make their appearance, cross-plow in spring, about a month before sowing, but only two or three inches deep, so as to preserve the winter surface for the roots of flax. Following the last harrowing, it is necessary to roll, to give an even surface and consolidate the land, breaking up this again with a short-toothed or seed harrow, before sowing, which should be up and down, not across the ridges, or anglewise.

Sowing—The seed best adapted for the generality of soils is Riga, although Dutch has been used, in many districts of the country, for a series of years, with perfect success. American seed does not generally suit well, as it is apt to produce a coarse branchy stem. If used, it should be on deep loamy soils. Dutch seed has been used frequently of late, and produced excellent crops. In buying seed, select it plump, shining, and heavy, and of the best brands. Sift it clear of all the seeds of weeds, which will save a great deal of after trouble, when the crop is growing. This may be done by fanners, and through a wire sieve, twelve bars to the inch. The proportion of seed for sowing may be stated at three and a half imperial bushels to the Irish or plantation acre. (This is about 2 bushels to the imperial acre, the same as the U. S.) It is better to sow too thick than to thin; as with thick sowing, the stem grows tall and straight, gets only one or two seed capsules at the top; and the fiber is found greatly superior, in fineness and length, to that produced from thin-sown flax, which grows coarse, and branches out, producing much seed, but a very inferior quality of fiber. The ground being pulverized and well cleaned, roll and sow. If it has been laid off without ridges, it should be marked off in divisions, eight to ten feet broad, in order give an equable supply of seed. After sowing, cover it with a seed-harrow, going twice over it—once up and down, and once across or anglewise; as this makes it more equally spread, and divides the small drills made by the teeth of the harrow. Finish with the roller, which will leave the seed covered about an inch—the proper depth. The ridge should be very little raised in the center, when the ground is ready for the seed, otherwise the crop will not ripen evenly; and, when land is properly drained, there should be no ridges. The sowing of clover and grass seeds along with the flax is not advised when it can be conveniently avoided, as the plants injure the root-ends of the flax. But carrots may be sown, in suitable soils, in drills, so that the person pulling the flax may step over the rows, which may be afterwards hoed and cleaned, and should have some liquid manure. A stollen crop of rape or winter vetches, or of turnips of the stone or Norfolk globe varieties may be taken, after the flax is pulled. Rolling the ground after sowing is very advisable, care being taken not to roll when the ground is so wet that the earth adheres to the roller.

Manure—Well-rotted stable manure is as good as can be applied.

Weeding—If care has been paid to cleaning the seed and the soil, few weeds will appear; but if there be any, they must be carefully pulled. It is done in Belgium by women and children, who, with coarse cloth on their knees, creep along on all-fours. This injures the young plants less than walking over it. They should work, also, facing the wind, so that the plants laid flat by the pressure may be blown up again, or thus be assisted to gain their upright position. The tender plant, pressed one way soon recovers; but, if twisted or flattened by careless weeders, it seldom rises again.

Pulling—When any of the crop is lying, and suffering from wet, it should be pulled as soon as possible, and kept by itself. So long as the ground is undrained, and imperfectly levelled before sowing, the flax will be found of different lengths. In such cases, pull each length separately. When there is much second growth, the flax should be caught by the puller just underneath the bolls, which will leave the short stalks behind. If the latter be few, it is best not to pull them at all. It is most essential to take time and care to keep the flax even, like a brush, at the root ends.

Saving the Flax—This requires to be very carefully done, as inattention will reduce the value of the straw, and yield inferior fiber. When made up, for drying in large sheaves, the straw is much injured, the outside stalks being much discolored by the heat of the sun, before the inside of the sheaf is dry, and the weight of the straw is reduced. The flax stems should be put together in bunches about one-half larger than a man can grasp in one hand, spread a little, and laid on the ground in rows after each puller; the branches laid with tops and roots alternately, which prevents the seed bolls from sticking to each other in lifting. It should be stooked as soon after pulling as possible, and never allowed to remain over night unstooked, except in settled weather. The stooking should go on at the same time as the pulling, as, if flax is allowed to get rain while on the ground, its color is injured. A well-trained stooker will put up the produce of a statute acre or more, in good order, in a day with two boys or girls to hand him the bunches. The flax should be handed with the tops to the stooker. The hand-fuls, as pulled, are set up without being tied, resting against each other—the root-end spread well out, and the tops joining like the letter A. The stooks are made eight to ten feet long, and a short strap keeps the ends firm. The stooks should be very narrow at the top, and thinly put up, so they may get the full benefit of the weather. In six or eight days, at most, after being pulled, the flax should be ready for tying up in sheaves of the size of corn sheaves. It is then ricked, and allowed to stand in the field until the seed is dry enough for stacking. To build the rick, lay two poles parallel on the ground, about a foot asunder, (a very few poles will do an acre.) The flax is then built upon these, the length of a sheaf in thickness or breadth. The poles should be laid north and south, so that the sun shall get at both sides of the rick during the day. In building, the sheaves should be laid tops and roots alternately, built seven to eight feet high, and finished on the top by laying a single row of sheaves lengthwise, or across the others, and then another row as before, but, with the tops all the same way, which gives a slope to throw off rain, and finished by putting on the top a little straw, tied down with straw ropes, fixed to each end of the poles upon which the rick is built. In this way the bolls will be fully ripened for keeping in a stack, without the straw receiving injury by long exposure to the weather. If the straw is discolored, it is very much reduced in value. To preserve a fine yellow-colored straw should be the object.

How to WALK—In walking, always turn your toes out and your thoughts inward. The former will prevent your falling into cellars, the latter from falling into iniquity.

CORN AND THE WIRE-WORM.

I WISH to give a few hints on the subject of Corn Planting and the Wire-worm. Having heard a number of complaints about the destructiveness of the wire-worm in corn, I thought, as the season of planting approached, it would be a fit time to give the result of my experience. At the time of planting I put two or three pieces of corn cobs in the hill, and in a few days, if there are any wire-worms in the soil, they will be found in the pith of the cob. They will remain there without interfering in the least with the corn. I have also become satisfied that the cobs answer in a measure as a fertilizer, as they will soon become saturated, and retain the moisture through the season. These worms are also destructive in wheat. Some years since, in the State of New-York, I plowed for summer fallow an old timothy meadow, which was of a mucky loam, and sowed it to wheat, which they totally destroyed. The next year I planted the same lot with the same result; they did not leave me the seed. My neighbor who had about the same luck that I had, tried the cob as an experiment. A few days after planting he invited me into his lot, where I found, on opening the hill, from one to a dozen worms in one cob.

The result was he had a full crop of corn. I followed the example the next year with entire success, on the same lot where my crop had been destroyed the year before.

Since then, I and the wire-worm have dissolved partnership on the corn dicker. If the remedy may prove as successful to others who may be troubled with the intruders, as it has to me, I shall feel amply rewarded for my scribbling.

JOHN WORMLEY.

[This remedy for the wire-worm is an excellent one, which we also found useful in a corn field that had been broken up the fall previous to planting. In addition to what Mr. Wormley says, the suggestion is thrown out, of the propriety of letting one of the boys gather the cobs at hoeing time, and then burn them, so as to destroy the worms. If left in the cob, they will wax fat and increase there just as rapidly as they would if left alone altogether.—*Ed. Mich. Farmer.*]

CHEAP WHOLE FLOUR BREAD.

THE present high price of provisions is felt by no class more severely than by the laboring agricultural population; and I observe that the diffusion among them of modes whereby they may husband their resources of food, is one of the topics of the day. I shall endeavor to give some aid in this by stating the result of an economical system of bread-making followed in my family for some months. The tailings of wheat are sent to the mill, ground into flour, and returned with the loss of only about 6 per cent. in weight, being moisture evaporated in the milling process. This flour is made into dough with buttermilk instead of water. A dessert-spoonful of carbonate of soda is mixed with a portion of the milk, and a little yeast added, with salt to taste. This leavens the lump in a few minutes; it is at once shaped out into loaves, and put into the kitchen oven, from which it is taken in rather less than an hour, in the form of wholesome brown bread, pleasing to the palate and easy of digestion. The cost stands thus: A bushel of tailings, weighing 57 lbs., gave a return of 54 lbs. of flour; value of wheat, 7s. 6d., (English currency;) milling and cartage, 6d.—8s. A baking of 6 lbs. flour at this rate costs 10½d.; half gallon buttermilk, 3d.; yeast, carbonate of soda, and salt, 1½d.; total, 1s. 3d. From this is produced 10½ lbs. bread, which cost 1½d. per lb., say 5d. for the 4 lb. loaf! The labor of making is scarcely worth reckoning, being an act of pleasing housewifery to one of the family. The oven of the cooking stove is, ordinarily, hot enough to fire the bread put into it. Thus there is no expense for the item of firing. It is true that an ordinary cot-

tager seldom has an oven; but he certainly ought to have one even for the daily purposes of cookery, and its cost would be made up by the savings on a very few weeks' loaves made as above. But, it may be said, all cannot have tailings. True; but even in the event of using full weight wheat at 10s. 6d. per bushel, we should add but 1d. per loaf to the cost above stated; for a bushel of 63 lbs. wheat, costing, including milling, 11s., gives 60 lbs. flour; i. e., 1s. 1d. instead of 10½d. as above for the 6 lbs. flour required to make two and a half 4 lb. loaves. Thus, by following the simple process I have described, every one, from the Queen to cottager, may, even in the present dear times, command a quarter loaf for 6d.! I will not promise that it shall be so nutritious as my 5d. loaf; for chemistry, by one of its latest and best expounders, teaches us that "the tail corn which the farmer separates before bringing his grain to market, and usually grinds for his own use, is richer in gluten than the plump full-grown grain, and is therefore more nutritious." By the way, this is another proof that we farmers don't enough prize our blessings; for here we learn that what we were wont to consider a grievance, the consuming at home of our inferior grains, has really been one of the causes of the goodly development of thews and sinews which marks the tenant farmer class.—*Agricultural Gazette.*

PRACTICAL HINTS ABOUT THE DAIRY.

WE are now approaching a time when those who have a dairy, either large or small, should pride themselves in the production of the best butter and cheese that can be made. The first thing the farmer ought to attend is the food for the cows, otherwise the labors of the most careful dairy-maid will be of little use. Many are tempted to produce quantity rather than quality; but those who are renowned for manufacturing a superior article are sure to find the best customers and the best price in the market. Next to food for the cows comes cleanliness in the dairy. It is no uncommon thing to find that the possessors of large dairies are by no means celebrated for the best flavored butter; we frequently see them beaten by those with only two or three cows, where their produce is solely managed by the farmer's wife. Such persons are usually found to be scrupulously clean in every thing belonging to it. Once let it be known, and every one of the neighborhood will be a customer, if they want a good article; to such the price is no object. It soon gets abroad that she rises early, and sees that no unwashed hands are permitted to milk unwashed udders—that the pans and pails are well scalded and exposed to the air—that the churn is clean and sweet, and the butter washed in clean water and made by her own clean hands. What a recommendation is this to those whose stomachs are not prepared to take any thing and every thing that comes in their way, without regard to the mode of producing it! In large establishments the case is frequently very different. A certain number of lads or maids have to milk a certain number of cows, and, so long as they bring in a fair quantity of milk, few questions are asked. In such places from one to two or more young dairymaids are kept at low wages. Their appearance in person and dress should be the perfection of neatness and cleanliness, but too often the reverse is the case; and in this, as many other instances in the preparation of what we eat and drink, if we did but reflect on such things, we should feel but little pleasure in eating and drinking. Cleanliness in the dairy itself is of the highest importance. It should be used for nothing else—nothing calculated to taint the atmosphere should enter or be near it; yet how common it is to see it used as a larder, because it is cool! Any thing that is wanted to be kept as long as possible is thrust into the dairy. In many cases the scullery for washing up the utensils, with a heated copper of water, joins the dairy, and oftentimes the door between

left open, admitting the steam from sour vessels. Most dairies have windows to admit air; and so long as they are open, it suffices, without regard to the out-of-door temperature, or whether the wind blows from one quarter or another. Perhaps the window nearest the yard or piggery, tainted by the animals or sour wash or grains, is left open when the wind blows in that direction, and carries with it all it can gather, to taint the dairy. No wonder that, under such circumstances, the produce is not good. Having had some experience in these matters, we do not hesitate to say that such things have a very bad influence on the quality of the butter and cheese. Remove these evils, and let it be known; then raise your price, and your returns will be greater.—*Gardeners' Chronicle*.

SLEEPING SEEDS.

THE germination of seeds is a thing which many are interested in, and any method to insure their pushing into growth more speedily than usual, would doubtless be received by many with delight. I have found the following plan of steeping them to be of service in my own case. When about to sow seeds, such as peas, broad beans, French beans, &c., I collect some sheep-droppings beforehand, and put them into a vessel with water, enough to moisten them. Into this I put my seeds, but of course into something by means of which they may be conveniently withdrawn when required. Thus situated I let them remain till well soaked, when they will be in a fit state for sowing. I have found that for beans about 36 hours are required, and for peas about 24 hours. Steeping, however, does not apply to the above-mentioned seeds alone; it may be practised with advantage on many others, and doubtless many flower seeds might be safely treated in this way as well, and with success. This will, however, very much depend upon whether the plants intended to be raised are gross feeders or not; and also whether the soil contains much organic matter or not; for of course the more it contains the less time in proportion will the seed require to soak before being sown. This practice will be found (on poor soils especially) to be of very great service to gardeners in general; for it will not only hasten their crops, but will make them as strong and vigorous as need be; and those who have never tried it would be quite surprised to see the difference it makes; an instance of which I will now give. In 1852 I made a trial with French beans—a small quantity was placed in the soil, and at the same time a small quantity in sheep-droppings, as described, where they remained about 44 hours; they were then taken up and put in soil near the former; and the result was surprising; but at the time the former were about 8 inches high, the latter were, to the best of my recollection, nearly double that height, and their foliage testified as to the state of health the plants were in. I have since practised steeping with good results, and others who may be induced to give it a trial will no doubt be similarly rewarded.—*Joseph Divers, Maidstone*. [Would they not have grown just as well, if you had steeped them in clear rain water?—*Gardeners' Chronicle*.

ON THE MEANS OF MULTIPLYING THE SMALLER BIRDS AROUND OUR DWELLINGS.

ON this subject, the last number of *Hovey's Magazine* contains an excellent article from the pen of Wilson Flagg. We can, in brief, give his points. Few realize how much birds, as companions of our residences, add to our happiness. To those pent up in the city, a walk one of these bright mornings to where the merry birds are laughing in the fulness of their joy is ecstasy; and as all pleasant impressions go toward forming our character and life, the more numerous we can make them the better. Birds, like the flowers, green fields and singing brooks, are part of the poetry of the

world—banish them, and how gladness would give place to gloom, and music to mourning. Birds, too, apart from the happiness they give us, are real *friends* to the farmer; they rid him of thousands of insects that would destroy his crops.

Mr. Flagg gives two plain methods of preserving birds:—"The first consists in omitting to destroy them; the second in promoting the growth of certain trees, and other plants on which they depend for shelter and subsistence.

The birds, considered in relation to trees and shrubbery, may be divided into two classes. First, the familiar birds that live in our orchards and gardens, and increase in numbers in proportion as the woods are cleared, and the lands devoted to tillage. To this class belong several of our sparrows, the wren, the blue-bird, the American robin, the bobolink, the linnet, the yellow-bird, and some others. The second are the less familiar birds that frequent the woods and wild pastures, and which would probably be exterminated by reducing the whole forest to park or tillage. Among these may be named the little wood-sparrow, one of the sweetest of American songsters, nearly all the thrushes, the towhee finch, and many of the *sylvias*, and wood-peckers.

To preserve the first of these species little is necessary to be done except to avoid destroying them; but to insure the multiplication of the second, we must study their haunts, the substances provided by nature for their food, the plants that afford them shelter, and to a certain extent labor to preserve all these for their use. The little brown sparrow is never heard in the heart of our villages, unless they are closely surrounded by woods. Yet this bird does not live in the woods. He frequents the pastures which are overgrown with wild shrubs, and their undergrowth of vines, mosses, and ferns that unite imperceptibly with the green sward by which they are surrounded. He is always found in the whortleberry pastures, and probably makes his repast on these simple fruits in their season.

He builds his nest on the ground, on a mossy knoll, under the protection of a thicket. Every bird is more or less attached to a particular character of grounds and shrubbery; and if we destroy this character, we drive this particular species from our neighborhood, to seek in other places its natural habitats. Hence we may account for the comparative silence that pervades the grounds of some of our most admired country seats, for with respect to the wants of our most familiar birds, it is possible that cultivation may be carried too far."

In all well-cultivated farms and country residences the familiar birds will be plenty; but the others will frequent those places only, where wild shrubbery, thickets, &c., abound. Every one by watching the habits of birds can tell what is necessary to induce them to be friendly. By removing all underbrush, you as effectually banish the cat-bird, red thrush, &c., as you would exterminate the squirrel by destroying all nut-bearing trees.

A fence-row near the house grown up with all sorts of wild plants, will become an aviary of many singing birds. Study the habits of the blue-bird, martin and swallow, and you may have them about you by thousands.

From the earliest period of our history, it has been customary among our people to encourage the multiplication of swallows, by the erection of bird-houses in their gardens and enclosures. This custom was probably derived from the aborigines, who were in the habit of furnishing a hospitable retreat for the purple martin, by fixing hollow gourds or calabashes upon the branches of trees near their cabins. It is generally believed that these little birds serve, by their unceasing annoyances, to drive away the hawks and crows from their vicinity, performing thereby an essential service to the farmer. This pleasing and useful custom has of late years grown unaccountably into disuse. The chattering of swallows is one of the de-

lightful accompaniments of a vernal morning; and that of the martin, in particular, is the most enlivening of all sounds from animated nature. As the birds of the swallow tribe subsist upon insects that inhabit the atmosphere, it is not in our power to increase their means of subsistence. Hence the only means we can use for increasing their numbers is to supply them with a shelter and retreat. By such appliances it would be easy to keep their numbers up to a level with the quantities of insects that constitute their prey.

The wren and the blue-bird are encouraged by similar accommodations. But these birds are not social in their habits, a separate box must be supplied for each pair of birds. The wren is an indefatigable destroyer of insects, and one of the most interesting of our familiar songsters, singing like the riser, during the heat of the day, when most other birds are silent. The blue-bird, which is hardly less familiar, delights in the hollow branch of an old tree in the orchard, but would be equally satisfied with an artificial imitation of the rude convenience supplied him by nature.

If we observe all these requirements, when employed in tilling a farm or laying out a country seat, we do but avoid the destruction of those beautiful relations which nature has established throughout the earth. The plow and the scythe may do their work for man, without interfering with the wants of those creatures whom nature has appointed as the enliveners of his toil. Every estate might be made to represent the whole country, in its fields and cultivated lawn, with their proper admixture of forest, thicket and primitive herbage. Then, while sitting at our windows, the eye would be delighted by the sight of little coppices of wild shrubbery, with their undergrowth of mosses, ferns, and Christmas evergreens, rising in the midst of the smooth lawn, and charming opposition to the flower-beds, that are distributed in other parts of the ground. In these miniature wilds the small birds would find a shelter suited to all their wants and instincts, and in return for our hospitality, would act as the sentinels of our orchards and gardens, and the musicians to attend in our daily labor and recreations.

CLAIMS OF AGRICULTURAL PATENTS FOR THE WEEK ENDING APRIL 25, 1854.

DITCHING PLOW.—J. C. Tiffany, of Coxsackie, N. Y.: I claim, first, one or more adjustable coulters or cutters, in combination with a permanent coulters, with one or more adjustable elevators, with a mold board or mold boards attached, as described.

I do not claim any of the parts or devices enumerated, separately or alone, but in combination, and in combination only.

Second, I claim the flexible adjustable spreader for moving the earth from or returning it to the ditch as required, as described.

Third, I claim the flexible adjustable spreader in combination with the plow, as set forth.

Fourth, I claim the devices, substantially as described, or their equivalents, for changing the position of the rear end of the beam, in combination with the angular slot, and curved plate, as described.

FIELD FENCE.—D. R. Prindle, of East Bethany, N. Y.: I claim the method described, or its equivalents of fastening together the adjacent posts or standards of a field fence, that is, by passing a piece of metal having a head on one end through two adjacent posts, and securing the same by a wedge or its equivalent at the other end, the standards or posts being so beveled as to cause any desired angle to be made by any two adjacent panels.

GUARD FINGERS FOR HARVESTERS.—W. F. Ketchum, (Assignor to Rufus S. Howard,) of Buffalo, N. Y.: I claim moulding and casting the blank for the tooth in the open form described, (without a chill,) then mallefying, dressing up, and bending them into the proper shape as required.

Horticultural Department.

To HORTICULTURISTS. — Our weekly issue of so large a journal, gives us ample room to devote to the different departments of cultivation, and we have commenced with this volume, to allot a separate space to Horticulture. We have secured additional efficient aid in its conduction, and we invite horticulturists generally, to send in their contributions on all subjects interesting and instructive to those engaged in similar pursuits with themselves. We are receiving the leading foreign and domestic horticultural journals, and shall be abundantly able to bring promptly before our readers all that transpires, which may be new and useful.

CELERY.

A CORRESPONDENT from Trenton, N.J., inquires the best method for cultivating celery, the soil adapted to it, and the best time of setting the young plants. As we have cultivated this delicious vegetable for seven years, with very good success, we give him the results of our experience. It requires more attention than most other vegetables, and the growing of good celery is a much more difficult matter than its preservation. The chief difficulty about it is to attend to its wants often and seasonably.

If you wish early celery, you must sow your seed in March, in a hot-bed, and put out your plants in the trench in June, or early in July. If you only care for it late, sow in May, in the open ground. Select a moist, rich spot for your seed bed, thoroughly prepared. The finer the tilth of the mold, the better your seed will germinate. An old mat, thrown over the bed, or any light covering of grass or weeds, will aid the sprouting. The covering should be removed as soon as the plants are well up. As soon as the plants are up an inch high, they should be pricked out, in a bed of rich mold, thoroughly prepared. A compost of muck and night-soil, or muck and hen-dung, is a very good manure for the bed. The plants should be set in drills, six inches apart, and four inches in the drill. You cannot have good strong plants without pricking out. They should be kept free from weeds, and the soil should be stirred once a week, until August.

The selection of a suitable spot for the trenches, is a matter of considerable importance. As celery needs a good deal of water, select a spot as near the watering-place as possible. Your soil should be two feet deep, and if there is not that depth of black loam, you must prepare it in the trenches for the occasion. You may prepare your trenches for growing two or four rows, as suits your convenience. If for two rows, the trenches should be 18 inches wide and 18 inches deep.

We have tried various kinds of manure, feathers, hair, night-soil, &c. We have obtained the best results from night-soil, well mixed with loam or charcoal dust, but we attributed this to the fact that it was used in larger quantities, rather than to any superiority in the manure. The hog's hair, though used in small quantities, gave satisfactory results. But almost any manure will do, if it be thoroughly incorporated with the soil in the bottom of the

trenches. If you use stable dung, the trenches should be filled at least six inches with it, and thoroughly worked into the soil with a fork.

JUNIAS SMITH, in the Patent Office Report, gives the following directions for setting out the plants in the trench. "The plants should be trimmed about the crown, just at the top of the root; all the young suckers taken off, leaving the plant trim and neat, with all its main stalks. With a dibble, which should be as large as the handle of a spade, as the roots will now be of considerable size, begin at one end of the trench, with your face toward the other, and set out a single row of plants in the middle of the trench, and not less than six inches asunder; water them well. No teetotaller loves water better than celery. It cannot have too much. The roots of this plant require more room than is generally allowed them, as any one may see when they are taken up for the table.

"Earthing up the plants should be delayed until they have attained a good size; and then it requires care, especially the first time. I always get into the trench myself, and holding the plant with all its stalks in my left hand firmly, with a short-handled small hoe draw the earth up around the plant, without allowing it to come in between the stalks. When this is done, and the plants thus protected, you may, with a spade, strike off the edges of the trench, and partially fill it. As the plant grows, continue to earth up, and by the first of November, the plants will be two feet above the level of the earth, and of the size of a man's arm."

Celery is sometimes attacked by a small fly, but this enemy is best avoided by watering freely. We have never noticed a diseased plant in our garden, and we attribute this to the watering more than to any thing else. Our celery trenches stand close by a ditch in which salt water flows, and we have found that watering with the brine once a week gave them great luxuriance. We have grown plants a yard long. Wherever a garden is near the shore, it will be worth while to try the experiment of salt watering. It is a marine plant, and must have salt in some shape, in order to attain perfection. It is a good plan to put salt into the compost for the trenches. Either of the following composts will be found effective in the trenches.

1st. Well decomposed stable manure, with ten gallons of strong brine, to each half cord.

2d. One cord of peat turf, meadow muck, and wood's earth, which has been decomposed by the salt and lime mixture, (three bushels of lime slacked in water saturated with salt,) with one hundred pounds of Peruvian guano, thoroughly mixed ten days before using.

Celery is a delicious vegetable, and makes an agreeable variety upon the table during winter and even into spring. Its use is chiefly confined to cities, because it requires some little skill to grow it, and gardeners in the suburbs can make it a paying crop. It might be cultivated with advantage in every garden.

As to the preservation of celery—if you live near a market, it is best to leave it with the market-man, buying only as you use it. We have tried various methods of keeping it in a cellar, but have never succeeded well. Some recommend banking it in moist sand, and this will probably succeed as well as any thing. If you grow the article yourself, you can keep it best in the trenches, taking out a supply for two

or three weeks as you wish it. The trench you design to use first, before the ground freezes solid for the winter, will be sufficiently protected by a covering of sea weed, or refuse straw, a foot thick. That which you wish to preserve till January, and later, should have a little house made over it. If your earthing up is not too high, two wide boards set upon their edges, on each side of the plants, and then inclined until they meet at the top, like a letter A, will answer very well. We have fine celery preserved in this way, at this date, May 1st. The tops are somewhat shortened by the frost, but the core is perfectly sound.

BROOKLYN HORTICULTURAL SOCIETY.

THE SEMI-ANNUAL EXHIBITION of this large and flourishing Society takes place at the Athenaeum, (corner of Atlantic and Clinton streets,) on Wednesday, Thursday, and Friday of this week. The exhibition will be first opened to the public, at 8 o'clock, P. M., on Wednesday, and continue open on the following two days, from 7 A. M. to 10 P. M. We unhesitatingly recommend every lover of good vegetables, fine plants, and rare and beautiful flowers to visit this exhibition.

This Society, though young, already numbers four or five hundred members; and they have thus far shown a spirit and enterprise worthy of commendation, and of imitation by other societies. From what we can learn, we judge that this exhibition will equal, if not far exceed, any similar exhibition yet held in this section of the country.

BONES IN THE GARDEN.

WE are, every season, discovering fresh evidence of the great value of bones as a fertilizer. We have to-day, been removing some pic plant, seedling of the Victoria, that were set out with bones under them last spring. The roots had, in many instances, completely penetrated the bones, so that they were lifted with the roots. They help the formation of small fibrous roots, and make the growth of the plants very vigorous. In removing a grape vine last season, we noticed the same fact. We now consider bones, or their equivalent, as indispensable in the garden. We put from a half to a whole bushel in every hole in which we set a fruit tree. The season of tree planting is not yet over; and we would say to our friends, make your holes broad and deep, and use bones liberally, if you would have a quick growth and fine fruit.

AN IMPERIAL BOUQUET.—A bouquet to be offered by the Horticultural Society of Toulouse to the Empress of the French, was exhibited there on Sunday, at the capitol in the Salle du Trone, where a vast crowd went to see it. Not less than 10,000 violets and 300 camellias have been employed in this gigantic bouquet, which is 2½ feet in diameter by 3 feet high. It is composed of a dome of violets surrounded by a circle of camellias, garlands of these last running down the dome, on which are to be seen the initials of her Majesty in orange flowers. A blue riband, also having the cipher of her Majesty, ties the stem of the bouquet. This beautiful object left Toulouse on Monday, and was to be presented to her Majesty on Wednesday, by M. Duplan, member of the Legislative Body, President of the Horticultural Society of the Haute Garonne.

American Agriculturist.

New-York, Wednesday, May 10, 1854.

BOUND VOLUMES.—We have a few sets (26 numbers) of volume eleventh, bound and unbound. The price, at the office, of the unbound volumes is \$1.00. The bound volumes are neatly put up in cloth covers, gilt backs, at \$1.50.

We can also furnish the covers separately, gilt and all ready for putting in the paper, for twenty-five cents each. With the covers thus prepared, any bookbinder can complete the binding for twenty-five cents. Volumes sent to the office will be bound complete for fifty cents.

We are having printed a new edition of the first ten annual volumes of the monthly *Agriculturist*, which can be supplied for \$1.25 per volume or \$10 for the set of ten volumes.

BACK NUMBERS.—We have taken the precaution to print each week a large number of extra copies, so that we can still supply new subscribers with full sets from the beginning of this volume, (March 15.) Any copies accidentally lost by a subscriber, will be freely supplied. Specimen copies sent to any person, whose address is furnished post-paid.

BREEDING TURKEYS.

EVERY turkey breeder is not aware of it, but it is a fact, that of either sex, one old turkey is worth two yearlings for rearing young ones. A turkey does not arrive at its full growth and maturity till the next fall after two years old, and of consequence, to its full strength and vigor for breeding in the best possible manner. The continual repetition of keeping young gobblers and pullets for breeding, as some people do, reduces the size of their young until they arrive at scarcely half the weight they should do. Besides this, the young of these immature birds are exceedingly tender, and much more difficult to raise than those of old birds. We have tried this thing thoroughly, and are convinced of the difference.

Were we to choose our birds for the very best breeding, both cocks and hens should not be less than three years old, and then the cock should be from a different stock from the hens. We think turkeys bear breeding from close affinities less successfully than any other fowl—at least we have found it so—and we would never breed a cock to hens which were closely related, if it could be helped.

Another thing, we prefer to let every hen set upon her own eggs, and with the first laying of the season. She hatches them better than a barn-door hen, and is the most natural and satisfactory mother. We have repeatedly set the first laying of eggs under the common hen, and turned the turkey out for a second clutch of eggs, on which she sat herself. But these second chicks are apt to be weaker than the first, and so late as not to obtain a fair growth before cold weather sets in—in fact, not worth half price. The turkey is a *natural* bird in all its habits, domesticated from a wild state, and yet retaining the constitutional propensities of its original race. Therefore the young should be reared in their *proper* season, when the varieties

of food they are partial to are the most abundant. Every young turkey should be out of the shell by the middle of June, at the latest, which gives them full time to get up to good size by "Thanksgiving," and fat and juicy by Christmas.

In corroboration of our remarks, there were turkeys exhibited at the late Poultry Show at the American Museum, in this city, which weighed 30½ pounds the cock, and 18 pounds the hen. These were extraordinary birds, to be sure, but they were well bred, and of full age and growth—and not wild turkeys, either. Mr. JOHN GILES, of Woodstock, Ct., sent us a cock turkey a few weeks ago, which weighs 33 pounds,—a giant of a fellow,—and he walks the poultry-yard with the measured tread of an emperor. We shall see whether we cannot increase the size and excellence of our turkeys by choice breeding. At the English shows they have got turkeys up to 40 pounds weight; and it will be a poor story, if, in the native country of the bird, with our fine, dry climate, and abundance of food, we cannot get him up to the standard of a climate less favorable to his development.

Many people suppose that the wild turkey is larger than the tame one. This is not so. Extraordinary exceptions have been found, when, in the height of the nutting season, with the wild bird at its fattest, a veteran gobbler has been shot that weighed 30 pounds or more. But well bred, at the same age, and in like condition, the tame turkey is the larger bird. We would, however, for a fresh cross, and to give the domestic turkeys additional stamina, prefer a dash of wild blood among them. It is wonderful to see the invigorating influences of the wild blood upon the tame in the first progeny. The style of the bird, in figure, plumage, action—all are changed. A degree of self-reliance is added to the young things as they creep and dodge among the leaves, "shirking for themselves." One single cross is sufficient—that is—half blood. More than that, is apt to give them shy and rambling habits, as it takes several generations of domestication to make the wild turkey thoroughly tame.

The wild turkey is truly a noble bird. Standing erect upon the ground, surrounded by his harem of females; proud, defiant, confiding in his own strength and prowess; his gorgeous, metallic plumage glistening in the sun, no living bird is equal to him. Even the Peacock, in all its attributes of beauty, will not rank with him. No wonder that AUDUBON grew eloquent, grand, and enthusiastic over his description.

As to color—the natural—that of the wild is the most to our taste. We have tried all colors. Light colored birds are apt to be less hardy than dark, and flesh less rich in appearance. Still, color is not essential, when the bird is, in all else, satisfactory.

AN INLAND GRAIN FLEET.—On the 26th of April a fleet of nineteen vessels, (three barks, six brigs, and ten schooners,) all freighted with grain, sailed from Chicago, Ill., for Buffalo, and for Oswego, via. Welland Canal. They were loaded with more than a quarter of a million bushels of grain, including 208,000 bushels of corn, and 33,000 bushels of wheat. More than four-fifths of this grain went to Buffalo.

THE FIRST FAIR OF THE CONNECTICUT STATE AGRICULTURAL SOCIETY.

A State Society is at length organized in this good old State, and the fair is to be held at New-Haven next fall. Twenty-five hundred dollars have been raised by the city to meet its expenses. The name of the Hon. EDWARD EVERETT has been mentioned in connection with the address on the occasion. No pains will be spared to make the fair worthy of the State. It is proposed to have a Board of Agriculture for the State, and a secretary to give all his time to the work of agricultural improvement. The cause as much needs such an agent, as education needs a commissioner of schools; and it is hoped that the farming interest will soon have such an advocate as the school interest has found in the Hon. HENRY BARNARD. Not less than twenty-five hundred dollars will be needed to support such an office, which it is proposed to raise, and we have little doubt that this will be done. Connecticut is not a State to overlook what will be so much to her pecuniary advantage.

WEBSTER'S DICTIONARY.

If we were asked by one just beginning to collect a library, what books should first be selected, we should unhesitatingly answer, let the *first* book be the Bible, and the *second* Webster's Dictionary—not a small pocket edition, but the best and most complete edition yet published, viz., the one issued by the Messrs. G. & C. MERRIAM, of Springfield, Mass.

The ordinary term *Dictionary* conveys a very imperfect idea of the work referred to. Encyclopedia would be a better word. There is hardly a word or term used in the whole circle of our language which is not here elucidated. To give the spelling and simple definition of a word is but a small part of the scope of this book. Almost every scientific term or phrase in use, is so fully and plainly described, as to bring it to the comprehension of the humblest scholar or reader. We have frequently turned over the leaves of one book of reference after another, in a vain search for the meaning of some scientific term which was new to us, and then have found all we desired in reference to it plainly stated in this dictionary.

We think the Messrs. MERRIAM deserve the thanks of the country for the manner in which they have brought out this work. It contains 1400 large pages, in good substantial binding, and yet the highest retail price asked for it is only six dollars. Twenty-five dollars could in no other way be expended to gather so much general information. Let every farmer, and every other person who can do so, have a copy of this book upon his table; and let it not be laid away in the parlor to be admired by an occasional visitor, but let it be kept in the most convenient place of access, where it may be daily referred to and studied. When a newspaper or book presents a word not entirely understood, let this dictionary be opened, and it will pretty surely make all plain.

Several States have furnished their public schools with a copy of this work, and we sincerely hope every other State will follow the example. In several instances where this book has not been furnished by the usual school funds, we have taken a subscription paper, and

in a few hours collected from small sums, enough to purchase the work and place it upon the teacher's desk.

A TIMELY MAP.—MESSRS. ENSIGN, BRIDGEMAN, & FANNING have just issued a very convenient map of Europe, which shows on a large scale, the location and relative position of the various countries likely to be affected by the present war. We have examined a copy, and find it just the thing to refer to on the arrival of news from over the Atlantic. If children now studying geography, can have such a map for constant reference, it will materially assist them in fixing their knowledge of this important division of the earth's surface. For price, &c., see advertisement.

CRYSTAL PALACE RE-OPENING.

This interesting ceremony took place on Thursday of last week. The exercises consisted of speeches by several distinguished men, and delightful music discoursed by various celebrated musical societies and bands, and individual singers and musicians. The attendance was very large—we have not seen a statement of the numbers present, but think that from thirty to forty thousand persons visited the Palace between 8 A. M. and 10 P. M. We were pleased to find that in the re-opening exercises, the rightful claims of labor were duly recognized. The artists and mechanics were treated as the real designers, artificers, and patrons of the World's Industrial Exhibition, and due honor was awarded to them.

We missed a few curious and interesting objects that were on exhibition last autumn, but we also noticed many new additions, and on the whole the general value of the Exhibition is not materially lessened, while there is a promise of a constant influx of the productions of art and labor. We expect to be well repaid for making a good many visits yet, and we advise all who can do so, to plan an excursion to this really grand collection. No one should come expecting to be satisfied with one or two half-day visits. The first day may well be devoted to a general survey of the building and the aggregate mass of objects, while future visits may be occupied with more particular examinations of the different departments. We shall at another time enumerate some of the more interesting objects.

WHITE FLAX SEED.

In reference to the White or Canary colored flax seed alluded to last week, we have seen a letter addressed to MESSRS. ABRAHAM BELL & SON, of this city, from which we make the following extract:

The grower of this seed asserts that he obtained 15 to 18 bushels of the white flax seed, where the same soil and space of land yielded only 7 or 8 bushels of the common kind of seed; and he claims that the lint produced from the fiber is worth double the price of the ordinary production, from its delicate and silken properties. I cannot positively vouch for the facts, as alleged, but believe you can safely reiterate them. Of one thing, however, I am certain, that the oil expressed from it is of as light color as if it had been bleached, and it is a good thing if half that is told about it be true.

MESSRS. BELL & SON expect to have a supply of this seed next spring. In the meantime as

we have received a small parcel, we shall be happy to send an ounce or so to a few of our friends, who may desire to test the truth of the above statements.

For the American Agriculturist.

THE ASPARAGUS PEA—COW PEA.

ENCLOSED is a sample of the Asparagus Pea in the pod, also seeds of the same. They require a trellis or brush a few feet high to run on. The pods have been grown here to measure three feet long. To cook, snap them into pieces of suitable length, and boil the same as asparagus, then serve up on toast with pepper, &c.

I likewise enclose a variety of the Cow Pea, which is the earliest to mature with us. Perhaps you may succeed in ripening them, and thus acclimating this very valuable food for man and beast. It is not as delicate for the table as other and later varieties. The origin of the Cow Pea is not known with certainty. This variety is called the "Goose Crow," from the fact that it was originally found in the crop of a wild goose shot here. An endless variety of the Cow Pea is cultivated at the south; and but for their ameliorating properties, our land would ere this have become barren. *It is the clover of the south.*

JAMES G. ROWE.

Aikin, N. C.

The above seeds are at our office, and we shall be pleased to distribute them among those desirous of experimenting with them. Mr. ROWE informs us that we mistook him in saying, in a late number of the *Agriculturist*, that the Orange Melon originated in the mountains of North Carolina, it was there *he first saw it*. The origin he does not know.

POTATO ROT.

A FEW days since we spent some time in conversation with the writer of the letter given below. Mr. COREY has evidently given considerable attention to the potato disease, and feels quite confident that he has discovered the true cause and at least a partial remedy. He wishes to pursue his investigations during the present season, and to have a few others also test his theories before they are given to the public. We have had no great faith in any remedy proposed for eradicating this disease, but we will do Mr. COREY the justice to say that his reasonings appeared plausible. We shall endeavor to experiment somewhat this season. This letter contains some good suggestions aside from its connection with what Mr. COREY deems a new and valuable discovery.

For the American Agriculturist.

FACTS WORTH KNOWING.

The potato rot may be propagated by means of diseased seedlings. Hence, much care should be exercised in the selection of potatoes for planting. There are but very few potatoes found in the market entirely free from this disease. The dry scab on the surface ordinarily indicates it as certainly as do the dark putrid spots within. Frequently the two show a diseased connection. For planting purposes, select those potatoes whose surfaces are the most free from all blemishes. Examine them attentively around the stem, eyes, &c., seeing also that there is no internal affection. If resort must be had to those which show signs of disease, cut out deeply all affected parts. It is far better to cut out and plant simply the potato eyes, including a reasonable quantity of the potato, than to plant whole potatoes which are in the least affected. Here an ounce of prevention is better than a pound of cure. Elevated lands

with a loose soil are better as respects this blight, than low lands naturally wet and heavy. New clearings recently burnt over, planted with healthy seedlings, are, other things being equal, least liable to said disease. Ground that has been well stirred and aired, and kept clean as in thorough cultivation of corn, for one or two prior seasons, is better than sod or stubble ground. Stable manure purified by filtration, with a mixture of salt, lime, and water, liberally applied to each hill at the time of planting, will tend to increase the crop and to counteract the disease. Plaster, lime, or ashes applied to the vines during their growing process, will have the same tendencies.

The potato rot, judging from its nature, is probably destined to always remain in all countries where it now exists; and, under the ordinary mode of cultivating the potato, is likely in warm wet seasons to increase. Much of the evil, however, arising from this disease, may be prevented on perfectly scientific principles at a moderate expense, when its true nature shall have become generally known and heeded.

The above remarks, all which are respectfully submitted, are based on known facts, gathered from investigations and experiments made during several consecutive years. C. COREY.

Lima, Ind., April 15th, 1854.

For the American Agriculturist.

A SUBSCRIBER'S OPINION OF THE AMERICAN AGRICULTURIST.

CROPS IN PENNSYLVANIA AND DELAWARE.

WE have received hundreds of flattering notices from our cotemporaries and from subscribers, which are a source of encouragement to us in our efforts to furnish a reliable and instructive paper. We do not think it just to our readers to occupy space to publish these, however much it might gratify our vanity. We will, however, depart from our usual custom, and insert the following letter, as it more particularly interests some of our correspondents than ourselves. We see the writer is "marriageable," and we publicly hand him over "to those interested." Here is his letter:

McDONOUGH, Del., April 25, 1854.

GENTLEMEN:—I subscribed to your paper for six months to try it, and although that time is scarcely half out, I send you the dollar needed to finish the year, while I think of it, for I say in all candor that it would be a great disappointment to miss it for only one week. In the first place, I think its pages are filled with matter just suited to the taste, wants, and comprehension of the farmer, and it does not depart from its legitimate sphere for the purpose of "filling up," which is so general among our agricultural journals. The articles are so seasonable too, every number containing the very information needed and wished for at the time of its arrival.

Not least interesting, are the articles written by your fair correspondents. I like them, and take great pleasure in looking them up, and reading them too—and that frequently more than once. I think the portion of your paper occupied by them, affords to the whole the savor of an exceedingly well-relished spice, and such as is found in very few of its kind, if in any, in so acceptable a form. I hope they will be continued, and increased in number, rather than otherwise. It strikes me very forcibly that they would make capital farmers' wives, (if they are not already.) Now, I am a young farmer, and some say I need, and I know I want a wife—and one that has a heart as good as some of your correspondents' articles indicate them to possess, if that is not aiming to high for me. The fact is, the ladies here take so little interest in farming, that it does me good to even hear of one who loves the occupation well enough to induce her to contribute to the happiness of its

followers only with her pen; and I believe the best stimulus to arouse to action the many who need it, would be to read the beautiful and instructive articles of their sisters. These have at least contributed their full share in making me, on so short an acquaintance, so strong a friend of the *American Agriculturist*.

But it is a lamentable fact that the ladies are not alone to blame, for even those who, as a class, are immediately engaged in agriculture, read far too little, particularly on such subjects as concern their own business. Many cry out as soon as an agricultural paper is mentioned, "I don't believe in book-farming." I have, as yet, never heard that expression from one to whom the language of "Minnie Myrtle" would not be applicable, namely, "A little book knowledge, practically applied," would be of considerable advantage. In truth, I consider the man who ridicules the idea that reading is beneficial to the farmer, a parallel case, as regards ignorance, with an Irishman employed on a farm not far from here, who, to tilt a cart, tried hard, it is said, to make the oxen stand on their hind feet. I should like all my friends to enjoy the same treat, and to share the same pleasure it gives me to peruse the pages of the *Agriculturist*. I hope they soon will, if they do not, I cannot help them further than to inform them of its existence. But I am saying too much for a social talk to one I never saw. I ask your pardon. I feel in some respects like your "Boy from Down East," who did not know how to stop.

For the last few days the farm operations have been partially suspended, owing to the four days' storm, which has made the ground, in many places, too wet to work. In Chester County, Pa., near the Lancaster line, I found that sleighing, and the other usual pleasant and unpleasant accompaniments of "second edition of winter," had been there in abundance. By the way, I think there are some ladies in that county, who practically exhibit such industry, generosity, gentleness, and intelligence, as should characterize that noble and lovely class of persons, the "Farmers' Daughters."

But spring is again here, the weather is now pleasant, the oats and grass begin to show very prettily; the wheat, far and near, at least in Chester County, Pa., and New-Castle County, Del., promises to yield most abundantly, and the corn, though it will be a week or more later than was anticipated, will be now speedily planted, and in good time. On the whole, it is thought the storm has done the farmers no great injury, and we now commence the season once more, "full of glee, and take its labor cheerily." J. H.

ABSORBING POWER OF SOILS.

It has been long known to chemists that clay possesses, to a small extent, the power of absorbing and fixing ammonia; but Mr. Way has shown that all fertile soils are capable of absorbing not only that substance, but the alkalies and magnesia. Thus, if a soil be shaken up with water containing a small quantity of ammonia or any of its salts in solution, and then left to deposit, the clear fluid drawn from the surface is found to be entirely free of ammonia. This absorption, however, is confined to the ammonia, none of the acid with which it is combined being retained by the soil. Thus, if sulphate of ammonia be employed, the whole of the sulphuric acid is found in the fluid combined with lime. A true chemical decomposition has here occurred, lime derived from the soil having replaced the ammonia in its compound. The extent to which the absorption of these substances takes place is small, and has, as yet, been accurately ascertained only with regard to ammonia and potash. It differs greatly according to the nature of the soil, and whether the substance is employed in the pure state or combined with acids. Thus, a loamy soil from Dorsetshire absorbed 0.3921 per cent. of ammonia; a lighter soil from Berkshire took up

0.1570, and a sub-soil clay from Somerset only 0.0818. In regard to potash, the experiments published by Mr. Way refer only to a sort of pottery clay, which takes up 0.4366, per cent. from the nitrate and 1.05 from a solution of pure caustic potash. Direct experiment has shown that this absorptive power is not due to sand; and as it is found to exist in pure potter's clay, brought up from a considerable depth, Mr. Way infers that it does not depend on organic matters, but is entirely due to the clay. In a later paper he has extended his investigations, and starting from the obvious fact that the absorption could not be due to the clay as a whole, but rather to some particular substance existing in it, and possessing a high degree of absorptive power, he has inquired into the subject in this point of view, and arrived at results of much practical and scientific interest. As it was manifestly impossible to extract from the clay the supposed substances to which its absorptive power was attributed, he adopted a different mode of investigation. He first proved that felspar, albite, and the other minerals from which the clay of our soils is produced, have no absorbent effect, and then proceeded to try what could be done by the artificial formation of substances of similar nature. When silicate of soda is added to a solution of alum, a white powder is formed which is a compound of silicate of alumina and silicate of soda, and this, when treated with a salt of lime, gives a similar compound, containing lime in place of soda. When this substance is macerated with a salt of potash or ammonia, it is decomposed, and there are formed double compounds containing these substances, and nearly insoluble in water. The potash compound so formed contains 24 per cent. of potash, and that of ammonia contains about 5 per cent. These substances are so little soluble in water, that a gallon extracts from them only 2.27 grains of potash, and little more than 1 grain of ammonia. The practical inference from these facts is sufficiently obvious; suppose the soil to contain the silicate of lime and alumina, and a quantity of sulphate of ammonia to be employed as a manure, we should necessarily have produced the absorptive effect actually observed in practice; sulphate of lime would be formed, and the ammonia would pass into the sparingly soluble double silicate of alumina and ammonia, which would thus become a magazine from which that important element of our crops would be slowly liberated to the extent of a grain for every gallon of water, so as to fulfil the requirements of the plant. The solubility of these compounds is however so small, that in some instances a sufficient quantity of potash and ammonia might not be obtained by the plant, were it not that their solubility is remarkably increased by carbonic acid and common salt. Mr. Way found that a gallon of water saturated with carbonic acid gas dissolved 2.5 grains of ammonia from its compound, and a solution containing 1.97 per cent. of common salt dissolved out ammonia at the rate of 23 grains per gallon. We have thus another function which carbonic acid may possess, and in addition to that of acting as a food for the plant, it may serve as the agent by means of which an additional supply of other substances is presented to it. The fact just mentioned may also explain the effect produced by common salt, which has always been a difficulty, especially since we have seen reason to believe soda is of little importance as a food of plants. We have already alluded to the absorption of phosphoric acid, which is in no degree dependent upon these double silicates, but solely on the presence of lime in the soil, with which it forms an insoluble compound. It cannot be doubted that these observations are of much importance, and have a very important bearing on the practice of agriculture. I cannot help thinking, however, that Mr. Way carries his views too far, when he denies any absorbent influence to the organic matters of the soil, and attributes it exclusively to these double silicates. It has been distinctly proved that humus absorbs and re-

tains ammonia and its carbonate; and though I do not know that the experiment has been tried, the humate of lime (which certainly exists in the soil) ought on chemical grounds to decompose the salts of ammonia, and form the humus of ammonia, which retains its base with great obstinacy. It must also be remembered that it has not been proved that these double silicates actually do exist in the soil, but only inferred, that because when artificially produced they absorb ammonia, they may be the cause of the same effect in the soil. Difficulties even exist in explaining how they should be formed there; but, with all this, it is manifest that the inquiry is an important contribution to our knowledge of the chemistry of the soil. But we must beware lest we carry too far the inferences to be deduced from those experiments, and I think there is rather a tendency to do so. The absorptive power of soils is a convenient phrase which I have sometimes heard used, as if sufficiently explaining facts otherwise unintelligible, although a very little consideration might have shown that they could not possibly have any connection with it.—Dr. Anderson's Address before the Highland Agricultural Society.

Boys' Corner.

PERSEVERANCE—ITS VALUE.

ABOUT ten years ago, there was a little news-boy—very little for his age, which was fourteen years—who sold papers at the corner now occupied by the Tribune buildings and its adjuncts. This boy, owing to his cheerful countenance, his proverbial integrity and industry—in brief, his good qualities generally, (and very good qualities are rarely found among the peripatetic vendors of the dailies and weeklies,) manufactured friends for himself every where, especially among the publishers. He did very good business as a news-boy, but his position did not suit him, as he once confidentially informed us, and he was determined to abandon it.

"That you can easily do," said we, "go into a store."

"I can neither read nor write," responded he mournfully.

"Apprentice yourself to some trade;" was then our advice.

"I think I will," he exclaimed with a brightening eye and a flushed cheek, "I think I will," and off he bounded.

We lost sight of him a short time after this conference was held, and finally forgot that such a being had existed.

About a week ago, an athletic, well-dressed man, with a ferocious—a regular brigandish—pair of whiskers, and a brace of merry, twinkling optics, that betokened a good heart and the best of health, stopped us in the street, and extending his hand, called us by name.

Not recognizing him we had recourse to the phrase of "Really, sir, you have the advantage of me."

"Not know —, the little news-boy?" he cried, as if astonished.

Truly it was our little news-boy. He had taken our advice and apprenticed himself to a machinist.

"Where are you working?" we inquired of him.

"Oh, I don't work now," was his proud answer: "I own, a sawmill on Long Island, and am doing business for myself. I have been my own boss for a year now. I bought out my concern with the savings of eight years, have a wife and two children, and my own cottage house and garden for them to live and delve in, and am as happy as the day is long. I can read and write, too," he continued smiling with an air of triumph.

That man will be *somebody* besides a boss yet. If we dared tell his name, hundreds would at once hail with rapture the good fortune of

their little friend who once supplied them with the *Sun* and *Herald* every morning.

Perseverance.—It is the grand lever by which the most astounding results may be accomplished. George Barrow, the author of *Lavengro* says, "Perseverance and a dogged determination to conquer all difficulties, will invariably make a man of the veriest dolt."

Do you hear that boys? No matter how poor or ignorant you may be, perseverance, conjoined with virtue, will gain you both wealth and education.

•••••
CAPITAL FOR THE YOUNG.—It is a consolation for all right-minded young men in this country, that though they might not be able to command as much pecuniary capital as they would wish to commence business themselves, yet there is a moral capital which they can have, that will weigh as much as money with those people whose opinion is worth having. And it does not take a great while to accumulate a respectable amount of this capital. It consists in truth, honesty, and integrity; to which may be added, decision, courage and perseverance. With these qualities there are few obstacles which cannot be overcome. Friends spring up and surround such a young man as if by magic. Confidence flows out to him, and business accumulates on his hands faster than he can ask it. And in a few short years such a young man is far in advance of many, who started with him, having equal talents, and larger pecuniary means; ere long our young friend stands foremost, the honored, trusted and loved. Would that we could induce every youthful reader to commence life on the principle that moral capital is the thing after all.—*Token*.

•••••
A CUTE BOY.—A little boy had a colt and a dog, and his generosity was often tried by visitors asking him—"just to see what he would say"—to give them one or both of his pets. One day he told a gentleman present he might have his colt—reserving the dog, much to the surprise of his mother, who asked:

"Why, Jacky, why didn't you give him the dog?"

"Say nothin', say nothin', mother, when he goes to get the colt, I'll set the dog on him!"

•••••
A GOOD BOY.—A touching incident occurred recently at a steamboat sinking in the Missouri river. Among the persons swept overboard was a woman and a boy 12 years of age. A man upon the steamboat, seeing the boy buffeting the waters just beyond the boat, threw him a rope, and called to the little fellow to take hold of it. He replied—"never mind me, I can swim—save mamma." The little fellow, with his dear mamma, was saved.

•••••
ENERGY.—See how that fellow works! no obstacle is too great for him to surmount, no ocean too wide for him to leap, no mountain too high for him to scale. He will make a stir in the world and no mistake.

Such are the men who build our railroads, dig up the mountains in California and enrich the world. There is nothing gained by idleness and sloth. This is the world of action, and to make money, gain a reputation, and exert a happy influence, men must be active, persevering, and energetic. They must not quail at shadows, run from lions, or attempt to dodge the lightning. Go forward zealously in whatever you undertake, and we will risk you, any where, and through life.

•••••
THE PURE BREED.—"Are these pure canaries?" asked a gentleman of a bird-dealer, with whom he was negotiating for a "gift for his fair."

"Yes sir," said the dealer, confidently, "I raised them 'ere birds from canary seed."

Miscellaneous.

HOW BOYS AND GIRLS ARE REARED.

TO PARENTS.

An article by Dr. Dixon, published in *The Scalpel* some time ago, is just now attracting some attention in the English papers. It is on the early decay of American women.

We give (says the doctor) the girl two years the start of the boy, to make her condition equal to his at the outset. Both have endured the torture of bandaging, pinning, and tight dress at birth; both have been rocked, jounced upon the knee; papa'd, laudanum'd, paregoric'd, castor oil'd, and suffocated with a blanket over the head, sweltered with a cap and feathers, roasted at a fire of anthracite, and poisoned with the foul air of an unventilated chamber, according to the universal formula of some superannuated doctor or inexperienced nurse; probably both, for these people usually hunt in couples, and are very gracious to each other. We give the girl enough start to make up for the benefit the boy has derived from chasing the cat, and an occasional tumble in the hall or the yard, and the torture she has endured from her sampler and being compelled to "sit up straight," and not to be a "hoyden."

Our little couple start to school with such a minimum of lungs as the unnatural life they have led will allow, and a stomach that is yet fresh enough to endure bad bread, plum-cake, candies, and diseased milk. The reader will remember that Nature is beneficent, and will endure much abuse before she succumbs. Well they are off for school; observe how circumspectly my little miss walks. Soon she chides her brother for being "rude." He, nothing daunted, starts, full tilt after a stray dog or pig; and though he often tumbles in the mud, and his clothes are spoiled, the result is soon visible in increase of lungs and ruddy cheeks. He cannot run without more breath; he cannot continue to run without increased dimension and power of lungs; he cannot have large lungs without good digestion; he will feel well and thrive apace.

They are now at school, seated on a bench without a back, and often with their legs hanging down, so that the poor back-bone has no earthly support. Thus sits the wretched child with book in hand, from nine till twelve o'clock and sometimes until three. The boy, with the aid of sticking a pin now and then in his neighbor, and occasionally falling from his bench from pure nervous exhaustion, to the great relief of his half-stagnant blood vessels and torpid nerves, endures it until another merciful pig or dog-chase makes him feel that he is alive.

But our unfortunate little miss is in a distressed condition. She is charged to walk "straight home," where she is allowed to select her dinner from those articles that afford the least nutrition, such as pastry, cake, rich puddings, and apples. This, by the way, is her second meal of the same character, having taken one either at breakfast or lunch.

After dinner, she either sits down at her sampler or piano, and in all probability finishes the day's feeding with tea and preserves. She is then posted off to a feather-bed in an unventilated room, with the door shut for fear the little darling will take cold. A Nott's stove or furnace keeps the upper chambers from 85 deg. to 100 deg., the feather bed and blankets retain all the heat of the body, and sweltering the wretched little creature lies till morning. What wonder she gets spinal curvature, or that there are actual deposits of tubercles in the body of her vertebræ or lungs.

•••••
"My son," said an old lady, "how must Jonah have felt when the whale swallowed him?"

"Down in the mouth," was the hopeful's reply.

I CAN DRINK OR LET IT ALONE.

"I CAN drink or let it alone," is a pass-word by which many young men have entered and become initiated into the lodge of intemperance, and have ultimately taken all the degrees, from the first social glass with a friend, when the bloom of health was on his cheek, the eye sparkling and bright, the step firm and elastic, the head clear, and prospects for the future bright and flattering; from a time when a father looked with feelings of pride upon his son, and felt that the money he had expended in his training and education had been well invested, and his name would be handed with honor to posterity—from the time, when a mother, who had watched over her darling boy so many anxious hours, and sleepless nights, and felt so much solicitude lest some lack of attention on her part, should cause sorrow or pain on his, was never doubly paid, as she looked upon him a man, feeling she had a staff to lean upon in her declining years—from the time when a sister, with feelings of pride introduced to her friends and acquaintances, "*My Brother,*"—*down! down!* to the time when that father's grey hairs have been brought in sorrow to the grave—to the time when that mother had wept oceans of scalding tears over her wayward boy, and had only been borne up by the hope that she might yet reclaim him ere he was laid in a "drunkard's grave,"—to the time when the sister had given up all her entreaties as fruitless, and shuddered when she heard the name of "brother"—and, perchance, to the time when a wife, whom he had, but a few years previously sworn to the altar to love, cherish and protect, and who had clung to him through every step of his downward career with a wife's devotion, looked upon her husband and felt that she was *more* than *widowed*, and her children *worse* than *orphans*. With the excuse, I say, (that heads this article) of "I can drink or let it alone," more men have passed through all the degrees of intemperance, I have so poorly pictured, until they are laid in the churchyard, and have left in the minds of the community in which they lived the knowledge, (if not inscribed on their tombstones) that they were *suicides*, than any other excuse that was ever offered in extenuation of the use of alcoholic drinks. Young man! I know from observation and experience, that you *cannot* "*drink or let it alone.*" If you drink at all, *you will drink as occasion offers*, and the occasional "social glass with a friend," as you accidentally meet, will result in seeking a friend to drink with, and end in drinking as often as it can be obtained.

The only safe course is, *not* to "*drink or let it alone,*" but to "*let it alone.*" For one I shall do so, and the following are among my reasons:

1st. I know it is injurious to my health, from this simple fact, if I had no other proofs, viz.: no person in a healthy condition can drink a glass of alcoholic liquor for the first time without feeling an effect upon the brain and nervous system—in fact, without becoming to a certain extent drunk. Consequently any thing that throws the system out of its natural healthy action, *must be injurious*. 2d. I know that it is injurious to my character, because no respectable man can be in the constant use of it without being sometimes thrown into the company of those far beneath him in morals and standing in society. "A man is known by the company he keeps," and the natural tendency is to lower yourself down until the scales are evenly balanced with those who had been far beneath. I know it is injurious to success in business pursuits, because not an individual can be found who would employ a person in any important business transactions who is in the habit of using strong drinks; and on the other hand, the best recommendation is to be known as a "temperance man." I know that it is injurious in a *pecuniary point*, because a *moderate drinker* who only takes his "*eye-opener*" in the morning, his "*eleven o'clock*" in the forenoon, his "*four o'clock*" in the afternoon, and his "*night cap*,"

expends in one year, *ninety-one dollars and twenty-five cents*, and ten years *thirteen hundred and six dollars and forty cents*. Those who drink two and three times as often may add for themselves. I know it is injurious to communities, because in those where it is most used, *there is the most poverty*. I know it is injurious to human happiness, because it has caused more murders, more suicides, tenanted more prisons and alms-houses, and caused more sighs and tears, and made more widows and orphans than all other evils combined.—*Salem Observer*.

SHEEP-SHEARING FESTIVAL IN WISCONSIN.—The Wisconsin State Agricultural Society, with a view to promoting the interests of sheep husbandry in that State, have instituted an annual "sheep-shearing festival." The first of these festivals is to be held at Whitewater on the 31st inst.

CATTLE FOR CALIFORNIA.—The Osceola (Iowa) *Independent* of last week says:

The number of cattle crossing the river at this place within the last month, from the different counties in the southwest, *en route* for California, is variously estimated at from five to six thousand.

WHEAT IN MICHIGAN.—The editor of *The Lapeer Democrat* says:

"While other portions of the State are complaining of the sad appearance of the wheat crop, owing to its being winter-killed, the farmers of Lapeer County have reason to congratulate themselves that they have a prospect of a fair crop.

This is the case generally in the north part of the State, but the south part complains of great loss.

FLUSHING, L. I., April 15.

THE WEATHER AND CROPS.—A large part of the peach buds are said to be winter-killed in this neighborhood. A good crop is not looked for.

WARREN Co., O., April 12.

There is a good deal of complaint here of winter-killed wheat. It is pretty certain it will not be as good as last year, but I hope not as bad as the croakers would have you believe. Our prospect for fruit is pretty good. It is certain that all the peach buds have not been killed by the cold.

SANDUSKY, April, 11.

As the spring advances the wheat crop is more promising. It is my opinion we shall have an average crop.

JERSEY Co., ILL., April 9.

The prospect of a wheat crop has not been better for years. The fields are carpeted with green, and the weather is promising.

GREAT FALL OF RAIN.—The fall of rain from Wednesday to Saturday of last week, according to the New-York Hospital gauge, was five inches and ten-hundredths; and according to the Flatbush rain gauge, five inches and ninety-four hundredths this is not so heavy a fall of rain as was recorded at Flatbush in 1843, for on the 50th, 21st and 22d of August of that year, nine inches and seventy-hundredths of an inch fell.

The fall of rain in Philadelphia, from Thursday afternoon until noon, was nearly $3\frac{1}{2}$ inches.

AN OLD ROCK.—An old bachelor geologist was boasting that every rock was as familiar to him as the alphabet. A lady who was present, declared that she knew of a rock of which he was wholly ignorant. "Name it, madam!" cried Cælebs, in a rage. "It is *rock the cradle*, sir," replied the lady.

In the choice of a wife, take the obedient daughter of a good mother.

MAN versus HORSE.—Last week, a trial of strength came off at Burscough Bridge, under the following circumstances. It appears that a wager of a quarter cask of ale had been made between a well-known wheelwright of the neighborhood, and a brewer from near Ormskirk, that ten men could not draw a load of stone up Burscough Bridge, which a pair of horses had previously done. The wheelwright backed the men, and the brewer the horses. On the day appointed, the horses brought from the quarry, for the use of the Wigan and Southport Railway, a load of stone of about 50 cwts., weighing, with the cart, upwards of three and a half tons. This load they took to the top of the bridge and down again. The worthy wheelwright now marshalled the force, consisting of nine stalwart young men belonging to the neighborhood. A cross piece of wood was firmly fixed to the shafts, supported by as many of the men as could attach themselves to it, the rest either dragging or pushing, and in this manner, cheered on by the acclamations of an immense crowd, they dragged the ponderous load up the bridge with the greatest ease, the knight of the wheel thus winning the wager with one man less than his stipulated number.

WE MUST ADVANCE.—Perhaps there is no higher proof of the excellency of man than this—that to a mind properly cultivated, whatever is bounded is little. The mind is continually laboring to advance, step by step, through successive gradations of excellence, towards perfection, which is dimly seen, at a great, though not hopeless distance, and which we must always follow because we never can attain; but the pursuit rewards itself; one truth teaches another, and our store is always increasing, though nature can never be exhausted.—*Sir Joshua Reynolds*.

DOMESTIC HAPPINESS.—If a happy marriage has given and insures to man peace at home, let there be no dread of the caprices of chance; his happiness is sheltered from the strokes of fortune. A wife gentle and affectionate, sensible and virtuous, will fill his whole heart and leave no room for sadness. What will he care for the loss of property when he possesses this treasure? Is not his house sufficiently magnificent as long as she commands respect to it—splendid enough, as long as her presence adorns it? A cottage where virtue dwells, is far superior to a palace; it becomes a temple.

AN ANSWER.—Mr. Whiteside, the barrister, cross-examining a witness in Dublin somewhat rudely, asked him if he had never been before a police court? "Yes," said he, "I was fined for an assault. A barrister so annoyed me by cross-examination that I knocked him down when he came out of court."

"I WONDER what makes my eyes so weak?" said a loafer to a gentleman.

"Why, they are in a weak place," returned the latter.

RHYME IS NOT ALWAYS POETRY.—The *N. O. Delta* says: "Mrs. Mary White, last Tuesday night, became extremely tight, and engaged in a fight, by punching the gourd of her too-loving lord with a piece of board. The neighbors all round were disturbed by the sound, and could not think of sleeping a wink, until the police came, and the turbulent dame was taken to jail, and not giving bail, poor Mrs. White was locked up for the night. She acknowledged the corn of taking a horn, and asked his honor to take pity upon her, and she solemnly swore, she'd do so no more. The Recorder heard her tale, and told her not to fail, to go immediately home, and in all time to come to leave off drinking rum, and conduct herself good, as all women should.

SURGEONS are the angels of this world—they are constantly redressing injuries.

SPECIAL NOTICE TO ALL SUBSCRIBERS.

WE find that by using such good paper, our volume of 832 pages will be quite large to bind, and especially large for those who wish to stitch their paper together with an index, without being at the expense of binding. To obviate this, we have concluded to be at the expense and trouble of making out an extra index with No. 26, so as to form a complete volume of the first 26 numbers. The index for the next 26 numbers will be given at the end of the year, or with No. 52. This arrangement will make it convenient for all, as the 52 numbers can be stitched or bound in two volumes with an index for each, or in one volume with the double index at the close.

We hope all will preserve their numbers, for there are many single articles each of which will be worth the price of the volume, for future reference. When the paper arrives from the post-office, a good plan is to see that it is properly folded, and then pin or sew it through the middle and cut open the leaves. It is very easy to stitch 26 numbers together. To do this, arrange them in regular order, and with an awl punch several holes about one-fourth of an inch from the back, and through these run a strong thread two or three times with a darning-needle, and the work is done. We have scores of volumes of papers, pamphlets, and addresses, thus prepared, which serve all the purposes of a bound volume, and occupy less room in storing and carrying. We would, however, prefer to see volumes of agricultural papers neatly bound and laid upon the book-shelves or tables of farmers. They are much better and more appropriate ornaments, than gilded volumes of trashy magazines or novels.

ONE WORD MORE.—We thank our friends for the liberal aid they have afforded us in extending the circulation of the *Agriculturist*. Our list has increased beyond our expectation, and we are daily encouraged to labor with the utmost diligence, to make our paper worthy of the confidence and admiration of our largely increasing list of readers. Our reliance for the continuance and increase of our list is upon those who are already readers. As stated above, we now divide the year so as to give either one or two complete volumes of the 52 numbers. Number 27 begins the second volume, or half of the year. We respectfully request all our present subscribers to make a little exertion at this time, and each send us on at least one new name. If you cannot get your neighbors to send on for a year, ask them to try the paper for six months, as in that time they will get a complete volume.

TO CORRESPONDENTS.—We have several communications on hand which we will look over as soon as we have time, and some of them will be published. It is no trifling labor to prepare for the printer many communications which we receive. Some are written so closely that there is not room to put in corrections, without re-writing the whole. We cheerfully prepare articles, unless there is manifest want of care on the part of the writer. If he does as well as he can, we make all needful changes and corrections.

As most writers doubtless wish to improve their own style, we suggest to them to keep an exact copy of their communications, and then compare this copy with the printed sheet. They may often learn something in this way.

We are not anxious to receive original poetry. We have little space for rhyme, and we have good selections enough to last us a year at least. Good poetry, however, will not be rejected; but we advise all who attempt to write in verse to remember, that good *rhyme* does not constitute good *poetry*; on the contrary, some of the best *poetry* we have ever seen does not "rhyme" at all, while some of the best *rhyme* contains not a single poetic sentiment.

Markets.

REMARKS.—Flour has advanced the past week full 50 cents per bbl. on the average. Corn 6 cents per bushel. Provisions a trifle less.

Cotton has fallen the past week from $\frac{1}{2}$ to $\frac{1}{4}$ of a cent per lb., notwithstanding the fact of a deficiency of 400,000 bales compared with the previous year's crop. This depression in the market is due to the war in Europe. Rice is firmer. Sugar and Tobacco no change.

The weather continued rainy till the 4th inst., when it cleared off cold for the season. To-day (8th) it is warmer, but the ground is still very wet and cold, and the drier soils only fit for planting.

Money continues as dear as ever, and as difficult to be obtained.

PRODUCE MARKETS.

Wholesale prices of the more important Vegetables, Fruits, &c., at the principle New-York Markets. In our weekly reports we give the prices which producers actually get, and not the prices at which produce is sold from the market.

Saturday, May 6, 1854.

The price of Vegetables is about the same as last week's report, but must fall off before long, for Potatoes especially. The heavy rains of last week prevented large quantities of produce from getting to market. Probably before this paper reaches our subscribers, the prices will be lower than we have to report them this week, as large quantities are expected by way of canal. There is but very little fruit in market at present, and of no extra quality.

VEGETABLES.—Potatoes, Mercers, \$4 @ \$4.25 per bbl.; Carters, ditto; Early Junes, \$3.50 @ \$4; Common, \$3 @ \$3.25; Onions white, per bbl., \$3.50; red, \$2.25; yellow, \$2.50; Turnips, yellow, per bbl., \$3; white, \$2.50; Beets, per bbl., \$3; Parsneps, per bbl., \$3; Carrots, \$3; Spinach, per bbl., \$2; Rape Sprouts, per bbl., \$1.50; Asparagus, per doz. bunches, \$3 and \$4; Lettuce, per doz., 25c @ 75c; Leeks, per doz., 75c; Cheroot Onions, per doz., 50c; Bermuda Potatoes, new, per bbl., \$6.

FRUITS.—Apples, Russets, per bbl., \$4.50 @ \$5. Some very few Red apples are worth \$6 per bbl.

Maple Sugar, per lb., 10 @ 11c.; Bermuda Tomatoes, per box, \$1.25.

New Butter, per lb., 23 @ 26c.; Old, 14 @ 15c.; Fresh Eggs, per doz., 17c.; Ohio Eggs, 16 @ 16½c.

NEW-YORK CATTLE MARKET.

Monday, May 8, 1854.

THE numbers in market to-day were considerably above last week's report. The day was very pleasant, and the sales rather slow. Many of the butchers were determined not to pay the prices that cattle were held at, which was about the same as last week. The majority of the cattle in the yards were very good. There was one lot of 10 from Kentucky, owned by ALEXANDER ROWAN; 5 of them were raised by HENRY CLAY, and were very nice indeed. They were held at 14c. per lb., and the owner not being able to obtain that price, they were put back in the stable.

Prices ranged from 9 @ 12c. per pound.

Washington Yards, Forty-fourth street.

A CARD.—The subscriber wishes to inform his friends that his connection with the "Horticulturist" has ceased, according to mutual agreement with the publisher. My name having been announced in the March number, my discontinuance should have also been announced, as requested, in the May issue. R. ROBINSON SCOTT, Rosedale Nurseries, Philad., Pa., May 1st, 1851. 35*

SHETLAND PONIES.—WANTED A GOOD FINE PAIR OF Shetland Ponies—One a stallion, the other a mare. Inquire at 189 Water street. 35-37

WILD TURKEYS.—TWO FIRST-RATE TURKEY COCKS of this breed. [35-36] Apply at 191 Water street.

WILD MEXICAN POTATOES.—These are raised from seed brought from Mexico three years ago. They boil dry and mealy, and are highly lauded for the table by those who have used them. They are as early as the Kidney, and the rot has not yet appeared among them. R. L. ALLEN, 35-37 189 and 191 Water st.

THE WAR IN EUROPE! A MAP FOR THE TIMES!—WE have just issued a Map of the countries now, or likely to be, involved in the European War. It has been very favorably noticed by the Press, and truly is the desideratum of the present day.

On receipt of FIFTY CENTS, we will send, free of postage, a copy in pocket form, enclosed in muslin cover.

May 1st, 1854. ENSIGN, BRIDGMAN & FANNING, Map Publishers and Mounters, 156 William st., New-York City. 34-35*

MONEY FOUND.—A SUM OF MONEY FOUND IN THE seed store, No. 187 Water street, which will be paid to any claimant who can prove the property and date of its loss. R. L. ALLEN. 34-35*

KETCHUM'S IMPROVED MOWING MACHINE WITH entire change of gear. The only successful mower now known.

Ketchum's Improved Machine, which we are building for the harvest of '54, was thoroughly tested last season, and the advantages gained by our change of gear are in all respects as we designed, viz: durability, convenience and ease of action. The shafts now have bearings at both ends, which overcomes all cramping and cutting away of boxes. A counter balance is attached to the crank shaft, which gives it a steady and uniform motion. Each Machine can be thrown out of gear; there is great convenience in getting at each and every nut, all of them being on UPPER SIDE OF THE FRAME; oil cups are attached to all the bearings, which, by the use of a wad of cotton, will hold oil for a long time, as well as protect the bearings from dust, grit, &c.; the finger bar is lined with iron its full width, which protects it from wear.

These and various other additions for strength, durability, &c., makes them the most simple and perfect agricultural implement in use. They weigh about 750 lbs. each, and can easily be carried in a one-horse wagon.

They will cut ALL KINDS OF GRASS, and operate well on uneven or rolling lands, or where there are dead furrows. This Machine took the highest award, with SPECIAL APPROBATION, at the World's Fair, it also received, during last season, one silver and four gold medals, and various other flattering and substantial testimonials of approval. We have spared neither pains nor money to make them deserving of public favor, and hope to be able the coming season to supply the great and increasing demand.

We take this occasion to caution farmers against buying RUSTY MOWERS, if they do, it was the case with many last year, they incur loss, vexation and disappointment.

In all cases where Extras are wanted, be sure to give us the NUMBER OF YOUR MACHINE.

(WARRANTY.) That said Machines are capable of cutting and spreading, with one span of horses and driver, from ten to fifteen acres per day of ANY KIND OF GRASS, and do it as well as is done with a scythe by the best of mowers. All orders filled by the subscribers. Office and Shop, corner of Chicago street and Hamburg Canal, near the Eastern R. R. Depot, in Buffalo N. Y. HOWARD & CO., Manufacturers and Proprietors.

For Sale by R. L. ALLEN, 189 Water street, N. Y.

The Mower is also manufactured by Ruggles, Nourse, Mason & Co., at Worcester, Mass. for the New-England States; By Seymour, Morgan & Co., Brockport, N. Y., for Illinois, Iowa and Michigan; By Warder & Brokaw, Springfield, O., for Ohio and Kentucky. 31-39

BERKSHIRE, LINCOLNSHIRE, AND SUFFOLK SWINE.

FOR SALE—THE ENTIRE STOCK OF SWINE NOW owned by SAMUEL LOVE, consisting of Berkshire, Lincolnshire, and Suffolk breeds of all sizes. This stock is worthy the attention of Farmers and others, who wish to procure the above breeds. The above swine have a good reputation, and have received the principal prizes at the exhibitions of the American Institute.

Gentlemen living at a distance can have them boxed and shipped from New-York.

Refer to A. B. ALLEN, editor of this paper, or to the Managers of the American Institute.

Letters addressed to A. B. Allen, will meet with immediate attention. SAMUEL LOVE, 33-40 Corner of 53d Street and 6th Avenue, New-York.

POUDRETTE.

THE LODI MANUFACTURING COMPANY OFFER their Poudrette for sale in lots to suit purchasers, from a single barrel up to 4000 barrels, at their usual rates, \$1 50 per barrel for any quantity over seven barrels, delivered on board of vessel in the city of N. York, free of cartage or other charge. When 200 or 300 barrels are taken, a deduction will be made from the above price. That this article has stood the test of fourteen years trial is proof of its efficacy. It is the cheapest and best manure for corn ever produced, and it has the advantage of being useful in small quantities and harmless in large. It is a capital manure for peas, strawberries, &c., and all garden vegetables. Apply by letter or personally to the Lodi Manufacturing Company. 32-33 74 Cortlandt st., New-York.

BERKSHIRE SWINE.

WANTED—TWO FEMALES, SIX TO EIGHT MONTHS old. They must be of good size, fine and pure bred. Please state lowest price. A. B. ALLEN, 189 Water st. 33-35.

SEACOR MAMMOTH BLACKBERRY. (BY SOME CALLED THE LAWTON BLACKBERRY.)—Lewis A. Seacor, the first discoverer and propagator of this rare and valuable fruit, respectfully informs the public, that although having *thus far* lost the honor of giving *name* to his fruit, yet he has on hand about one hundred bushels of the original stock, from which others have chiefly been derived. These plants be will warrant of superior quality, and will sell them at \$5 per dozen, (which is half the price asked by those who procured their original plants of him at a low price.) 32-33* LEWIS A. SEACOR, New-Rochell, N.Y.

SCARIFIERS FOR OLD MEADOWS.—AN INVALUABLE machine for ousting moss and the old fog from hide-bound meadows and renovating their grasses. To be drawn by one or more horses. [31-41] R. L. ALLEN, 191 Water street.

PORTABLE FORGES AND BELLows.

QUEEN'S PATENT.) THE BEST Forge in the market for Blacksmith's work, Boiler Makers, Mining, Quarrying, Shipping, Plantations, Contractors on Railroads and Public Works, Coppermiths, &c., &c. Also an improved PORTABLE MELTING FURNACE for Jewellers, Dentists, Chemists, &c., both of which are constructed with sliding doors to protect the fire from wind and rain when used out of doors, and for perfect safety and free escape of smoke indoors. They are compact for shipping. Circulars, with particulars and prices, will be forwarded upon application. Cast Iron Columns for buildings constantly on hand. The above forge has been awarded three Silver Medals by the American Institute, New-York, and the highest premium (Diplomas and Bronze Medals) at all other Fairs wherever exhibited. FREDERICK P. FLAGLER, 31-37 Sole Manufacturer, 210 Water st., N.Y.

GENUINE SUPER-PHOSPHATE OF LIME.

THE SUBSCRIBER HAS NOW ON HAND, AND IS CON-stantly manufacturing at his works in MIDDLETOWN, CONN., SUPER-PHOSPHATE OF LIME, which he warrants free from any adulteration, and equal in quality and value to any in the market. It is made of bones, prepared in the most approved manner, put up in substantial bags for transportation, and is furnished promptly to order, or at the works.

He also manufactures and has constantly on hand for the market, BONE DUST of a superior quality.

These fertilizers have been thoroughly tested by careful and experienced agriculturists in this vicinity, and have given general satisfaction. ANDREW COLE, March 13, 1854. [29-40] Middletown, Ct.

SALE OF STOCK.

PURE BRED STOCK AT PRIVATE SALE AT MOUNT FORDHAM, Westchester Co., New-York, Eleven Miles from City Hall, N. Y., By Harlem Railroad Car.
Having met with more success than I anticipated the past year, with the Catalogue of male animals at Private sale, is the reason for offering this lot of animals. AND MY JUNE SALE BY AUCTION, WILL NOT TAKE PLACE. A full descriptive Catalogue with prices attached, will be published on the fifteenth of April, and I intend to be at home myself to see any who may call. I will sell at private sale, about 18 Short-Horns, 6 of which are young Bulls and Bull Calves. The Cows and Heifers old enough, will be in Calf, to the Celebrated Imported Bull "BALCO," (9918) or Imported, "ROMEO," winner of the first Prize at Saratoga, in 1853; and also at American Institute the same year.
The young Bulls and Bull Calves, are some of them from Imported Cows, and sired in England; and others are sired by the Impure of Carabao (1739), winner of the first Prize at Saratoga, the past year, as a two year old.
Also, about 10 head of Devons, consisting of a yearling Bull, sired by MAJOR, and 5 Bull Calves, sired by my imported first Prize Bull, FRANK QUARTLY, and several of them from imported Cows and Heifers old enough, will be in Calf to FRANK QUARTLY. Also 6 or 8 Suffolk Sows; and several young Suffolk and Essex Boars. Also, 2 South-down Rams, imported direct from Jonas Webb; and 6 Yearling Rams, all bred by me, from Stock on both sides, imported from Jonas Webb. Catalogues will be forwarded by Mail if desired.
All Animals delivered on SHIPBOARD, or RAIL CAR in the City of New-York, free of expense to the purchaser. The Devons are in my Herdsdale Farm, 12 miles north, to which place I will take persons both to and from.
MY FRIEND MR. N. J. BECAR, who is interested in several of my importations, will also sell about 10 head of Short-Horns, consisting of 4 young Bulls, and 5 or 6 Females. His young Bulls are also several of them from imported Cows, and sired by the LORD OF ERYHOLMNE, (12305), and the celebrated first Prize Imported Bull ROMEO. Mr. Becar's Cows and Heifers are in Calf to the imported Bull, MARQUIS OF CARABAS, (2798). Mr. Becar can be seen at his Store, No. 187 Broadway, New-York, at which place he will make arrangements to go to his Farm, at Smithtown, Long Island. His animals will be entered in the same Catalogue with mine, which can be obtained by addressing him at his Store, or me at Mount Fordham. His animals will be delivered in the same manner as mine. Our importations have been in almost all cases made at the same time, and are of equal merit, excepting that I have more in number. L. G. MORRIS.
[23-47] Terms, Cash on delivery.
March 16th, 1854. 29-37

DIRECTIONS FOR THE USE OF GUANO.—A full and minute description of the different crops and soils to which Peruvian Guano is adapted, with full directions for its application, a pamphlet for 96 pages, and can be sent through the mail. Price 25 cents.
12-tf. R. L. ALLEN, 187 and 191 Water st.

GARDEN IMPLEMENTS.

HEDGE, LONG-HANDLE, AND SLIDING PRUNING SHEARS; Budding and Edging Knives; Pruning Hatchets, saws and knives; pruning, vine and flower scissors; bill and Milton hooks; lawn and garden rakes; garden scufflers, hoes of great variety, shovels and spades; hand engines, which throw water forty feet or more, syringes and water pots; grafting chisels, tree scrapers, and caterpillar brushes; transplanting trowels, reels; hand plow and cultivator, very useful to work between rows of vegetables, together with a large assortment of other implements too numerous to mention. [21-tf] R. L. ALLEN, 187 and 191 Water-st.

MORRIS FEMALE INSTITUTE.

THIS INSTITUTION IS SITUATED AT MORRISTOWN, N. J., about an hour and a half's ride from the city of New-York, on the Morris and Essex railroad; the cars leaving New-York several times a day. It has been ably patronized for the last six years. There will be a vacancy for a few more pupils in April.

Faithful teachers are provided for English branches usually required; also Drawing and Painting. French, Latin, and Spanish under a native teacher.

Vocal and instrumental music by an accomplished player, whose time and attention has been for years devoted exclusively to this object.

Further particulars, and circulars, may be obtained by applying to J. A. SEELEY, Principal, or at the book-store of Messrs. C. S. Shepard & Co., 152 Fulton street, near Broadway, or at this office.

Persons wishing to send their daughters from home, would do well to visit this Institution before deciding. 27-tf

NO. 1 SUPERPHOSPHATE OF LIME.—THIS VALUABLE fertilizer has been used for several years in England and other parts of Europe, and, next to Guano, holds the highest rank in popularity, and the extent to which it is used among farmers. Its introduction in this country has been among the most recent, but the progress it has made in the estimation of the public has not been less marked, or successful than abroad. It is now extensively used throughout the Northern States, after a full trial and investigation of its merits; and it is rapidly becoming, like its predecessor, Guano, a favorite manure at the South and West.

It is composed of crushed or ground bones, decomposed by the addition of about one fifth their weight of sulphuric acid, diluted with water, to which is added a due proportion of guano and sulphate of ammonia. The latter is the active and one of the most efficient agents in the best Peruvian Guano.

It is suited to any soil in which there is not already a full supply of the phosphates, which is seldom the case. All crops are benefited by its application.

It is sold in large or small quantities, in bags of 150 lbs. each. No charge for packages. All bags will be branded "C. B. De Burg, No. 1 Superphosphate of Lime."

PERUVIAN GUANO of best quality.
AGRICULTURAL AND HORTICULTURAL IMPLEMENTS of all kinds.

FIELD AND GARDEN SEEDS, of various sorts, fresh home grown and imported.

THE AMERICAN AGRICULTURIST—weekly, \$1 per volume—two volumes a year.

For sale at R. L. ALLEN'S Agricultural Warehouse and seed Store, 189 and 191 Water street, New-York. 25-tf

MUSQUIT GRASS.

THE TRUE MUSQUIT GRASS, GROWN BY A CAREFUL Georgia Planter. This has proved the most sure and valuable grass for stock yet cultivated at the South, and is invaluable to the planter. For sale by
RICHARD PETERS, Atlanta, Ga.,
R. L. ALLEN, 189 and 191 Water St., N.Y.
also by 27-tf

WILLARD FELT, NO. 191 PEARL STREET, (NEAR Maiden Lane), Manufacturer of Blank Books, and Importer and Dealer in Paper and Stationery of every description. Particular attention paid to orders 26-77

ATKINS' SELF-RAKING REAPER.—40 of these machines were used last harvest in grass or grain or both, with almost uniformly good success, in nine different States and Canada. TWENTY-SIX PREMIUMS, including two at the Crystal Palace, (silver and bronze medals,) were awarded it at the autumn exhibitions. I am building only 300, which are being rapidly ordered. Mr. Joseph Hall, Rochester, N. Y., will also build a few. Early orders necessary to insure a reaper.

Price at Chicago \$175—\$75 Cash with order, note for \$50, payable when reaper works successfully, and another for \$50, payable 1st December next with interest. Or \$160 cash in advance. Warranted to be a good Self-Raking Reaper. Agents properly recommended, wanted throughout the country. Experienced agents preferred. It is important this year to have the machines widely scattered.

Descriptive circulars with cuts, and giving impartially the difficulties as well as successes of the reaper, mailed to post-paid applications. J. S. WRIGHT.
"Prairie Farmer" Warehouses, Chicago, Feb., 1854. 23-35

GARDENER FOR THE GREEN-HOUSE AND GRAPE-HOUSE.—Wanted a Gardener as above, who is experienced in the management of the Green and Grape-House in the United States. None need apply except fully qualified. 22-tf A. B. ALLEN, 189 Water st.

FOR SALE AT THE SOUTH NORWALK NURSERY, THE Great New Rochelle or Lawton Blackberry Plants; also plants of the White fruited Blackberry. For sale also a large stock of small plants of the new or North River Red Antwerp plants, at the low price of fifteen dollars per thousand. The above plants all warranted. GEO. SEYMOUR & CO., South Norwalk Nursery, Conn. 24-36

AGRICULTURAL IMPLEMENTS.

AGRICULTURAL IMPLEMENTS.—THE SUBSCRIBER keeps constantly on hand, and offers for sale the following valuable implements:

Fan Mills of various kinds, for rice as well as wheat, rye, &c. Grain Drills, a machine which every large grain planter should possess. They are of the best patterns, embracing most valuable improvements.

Smut Machines, Pilkington's, the most approved for general use. Hay and Cotton Presses—Bullock's progressive power-presses, combining improvements which make them by far the best in use.

Grain mills, corn and cob crushers, a very large assortment of the best and latest improved kinds.

Horse Powers of all kinds, guaranteed the best in the United States. These embrace, 1st. The Chain Power, of my own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, and economy. They are universally approved wherever they have been tried. 2d. The Bogardus power, for one to four horses. These are compact, and wholly of iron, and adapted to all kinds of work. 3d. Eddy's Circular Wrought Iron Power, large cog-wheels, one to six horses, a new and favorite power. 4th. Trimble's Iron-Sweep Power, for one to four horses. 5th. Warren's Iron-Sweep Power, for one or two horses.

GRAIN MILLS, STEEL AND CAST IRON MILLS, At \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES.—FOR MAKING DRAINING TILES of all descriptions and sizes.

WATER RAMS, SUCTION, FORCE, AND ENDLESS-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL KINDS, MADE EXPRESSLY for the California and Oregon Markets.

DRAINING TILES OF ALL FORMS AND SIZES.

CLOVER AND TIMOTHY SEED HARVESTER.—A newly patented machine, will harvest 10 or 12 acres per day with one horse.

HAY AND COTTON PRESSES.—BULLOCK'S PROGRESSIVE Power Presses, combining improvements which make them by far the best in use.

THRESHERS AND FANNING-MILLS COMBINED.—OF Three Sizes and Prices, requiring from two to eight horses to drive them, with corresponding horse powers.—These are the latest improved patterns in the United States.

SOUTHERN PLOWS—Nos. 10 1/4, 11 1/4, 12 1/4, 14, 15, 18, 18 1/2, 19, 19 1/2, 20, A 1, A 2, 50, 60, and all other sizes.

CORN-SHELLERS, HAY, STRAW, AND STALK-CUTTERS, Fanning-Mills, &c., of all sizes.
1-tf R. L. ALLEN, 189 and 191 Water street.

FERTILIZERS.

R. L. ALLEN, 189 and 191 Water st., N.Y.

SUPERPHOSPHATE OF LIME, OR CHEMICAL MANURE.—100 tons Paterson's Improved, skillfully made of the best materials, and for sale at lowest rates, by HASKELL, MERRICK & BULL, Importers of Artificial Manures, Wholesale Agents for the Manufacturer, No. 10 Gold street. 1-31

HAIR RESTORERS, &c.

BARKER'S CHEVEUX TONIQUE.—THIS IS AN ENTIRELY new article, concocted for the purpose of Preserving, Restoring, and Beautifying the Hair, and, unlike most preparations designed for the same objects, it is free from all grease, so that its application cannot soil the most delicate fabric. As an eradicator of Dandruff, it is unequalled, while its infallibility in cases of headache, easing the most violent in a few moments, cannot fail to commend it to universal appreciation. The Cheveux Tonique is for sale by all the respectable druggists and fancy stores throughout the city. The depot for its sale, wholesale and retail, is at BARKER'S Ladies' Hair-dressing Establishment, No. 439 Broadway. 2-49

HORTICULTURAL.

FRUIT AND ORNAMENTAL TREES AND PLANTS.—Including every thing necessary to the Garden, Green-house, Nursery, and Orchard, with all the recent introductions, at very low rates. Descriptive price Catalogues gratis. Carriage paid to New-York. Ornamental and other planting done in any part of the country. The best season for transplanting is after Oct. 10. Address B. M. WATSON, Old Colony Nurseries, Plymouth, Mass. 8-59

R. L. ALLEN, 189 and 191 Water street.

STOCK.

IMPROVED STOCK OF ALL KINDS.—HAVING HAD great experience in breeding and rearing fine stock for the past twenty years, I offer my services to my friends to procure it of the best and most reliable kinds. As much notice as convenient is at all times desirable previous to purchasing, as it takes time to make good selections. Early in August or September is the best time to purchase for the South.

Short Horn or Durham cattle, Devons, Herefords, Alderney or Jersey and Ayrshire, Long-wool Sheep—the Cotswold, Oxford, Leicester, Bakewell, and Lincoln. Mutton Sheep—the Southdown, Fine-wooled Sheep—such as the Saxon, Spanish, and French Merino.

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, which are spurious.
1-tf A. B. ALLEN, Nos. 189 and 191 Water street.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master, and ask him to mark the envelope, *Registered by—, P. M.*

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

BACK NUMBERS are usually kept on hand, and when a subscription is sent without naming any date for commencing, the back numbers from the beginning of the current volume will be sent, unless as sometimes happens, an unusual rush of subscribers has exhausted the supply.

In writing, always give the Post-office (instead of the town) and the County and State. *Write these very plainly.*

Clubs may add to their number at the same rate per copy as was paid by the original members.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished	
with Harper's Magazine, one year for	\$4 00
" Putnam's do	4 00
" Knickerbocker do	4 00
" Eclectic do	6 00
" Little's Living Age do	6 50
" National Magazine do	3 50
" Dickens's Household Words	3 50

Address ALLEN & CO.,
189 Water street, New-York.

J. A. GRAY, Printer, 95 and 97 Cliff street, N. Y.

PUBLISHERS' ANNOUNCEMENT!

Twelfth Volume of

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B. The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon its own merits; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammelled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDD, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFF, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers,	-	-	\$2.00 a year, \$2.00
" Clubs of 3 do.	-	-	1.67 " 5.00
" do. 5 do.	-	-	1.60 " 8.00
" do. 10 do.	-	-	1.50 " 15.00
" do. 20 do.	-	-	1.25 " 25.00

The money always to accompany the names for which the paper is ordered.

The Post-Master, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Post-Master, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, *Weekly Tribune*, or *Weekly Times*, or any other paper or periodical in this city, not costing to exceed two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if enclosed and mailed in the presence of the Post-Master.

Communications for the paper should be addressed to the Editors; subscriptions, advertisements, and all matters relating to the business department, should be addressed to the Publishers,

SEE LAST PAGE.

WILL THERE BE A GREAT DROUTH THE COMING SUMMER?

WE do not pretend to be weather-wise, but those who do, say that animals, birds, and some other things in their late movements, prognosticate a dry summer. This is likely to be the case, and the only reason we can give for it is, that one extreme usually follows another. The Spring thus far has been very *cold* and *wet*—the summer consequently may be very *hot* and *dry*. This would prove highly calamitous to the laboring classes; for drained as the country already is of its products by the great demands for Europe the past six months, a long continued drouth would add considerably to the present prices, which are already very exorbitant.

The corn at the South has suffered materially by late frosts, and in many instances has already been planted the second and third time. This looks bad for that quarter, which of late years has become a large grower of corn. A short crop in that region would materially affect prices throughout the country.

Yet whether we have a great drouth the coming summer or not, the farmers ought to be well prepared for it. Let them remember the dry summer of 1852, and the great loss to them in half-starved animals that ensued. Hundreds of thousands of cattle were sacrificed to the butcher and otherwise the following winter, merely for want of fodder to carry them through till spring.

The best and most reliable substitute for grass and hay, which we can cultivate, is Indian corn grown in drills, and cut just as the grain gets fit for roasting ears or boiling for the table. Five to seven tons of dried fodder may be easily produced from an acre. Every farmer ought to raise at least a three months' supply for his stock, of Indian corn fodder, and a four months' supply would be still safer. It is best to get it in now as soon as possible. The stalks of the sweet varieties are much the most nutritious and palatable, although they do not produce so great a growth as some others—yet they are enough better to pay for this difference of production.

Next to Indian corn, we would recommend growing oats, to be cut when the grain is in the milk, and fed unthreshed. We consider that either the corn or oats thus raised, and fed with their grain on the stalks, equal—ton for ton—to the best of hay. The stalks should be cut up fine by a machine previous to feeding. It is a matter of economy to use the straw and corn-stalk cutter, even when the oats and corn are

cut and fed green from the field in the summer.

Millet is somewhat cultivated south of us; though farmers generally at the North are unacquainted with it; but from the few experiments we have made with it as a substitute for hay, we should place it next after oats. It may be sown broadcast, and cultivated the same as oats, though to sow in drills six inches apart, is better. It will yield from 2 to 4 tons per acre.

The fourth best substitute for a short crop of grass and hay, is roots, such as the sugar beet, carrot, parsnip, and turnip, which we value in the order we have placed them. Potatoes, on account of the prevalence of the rot, are too uncertain to be calculated upon. Cabbage and pumpkins are very good for partial feed during the autumn months.

FARM OF MR. WATSON.

WE spent a few hours last week in looking over this beautiful farm. It lies upon the river Bronx, near its embouchure into the East River, in Westchester County, about twelve miles from the New-York City Hall. It comprises about 220 acres, and was purchased by Mr. WATSON six years ago, and was then in rather a low state. He has got it into such fine condition now, that it took the first premium of \$50 last year, offered by the American Institute, for the best cultivated farm which the Committee visited in Westchester County.

This farm is devoted principally to grass and hay, of which it is now a large producer of the best qualities. For the consumption of this, Mr. WATSON keeps improved stock of various kinds. He formerly had a large and superior flock of Long-wooled sheep, but the dogs have proved so destructive in his neighborhood, he has been reluctantly compelled to dispose of most of them. He has a few Ayrshire cows, which he imported. These are among the finest specimens of the breed we have ever seen in point of form; added to this desirable quality, they are great milkers. He also showed us some excellent grade Durhams, which are great milkers. One of these, of medium size, gives 30 quarts or more, per day during her highest flow of milk.

Mr. WATSON showed us four superior colts by the famous Trustee, sire of the late Mr. GIBBON'S Fashion out of Bonnets of Blue. These colts are respectively one, two, three, and four years old. They are out of a well-bred trotting mare, that has done her mile in 2.40. We think these colts will all prove fast ones. As a getter of runners and trotters, Trustee has proved one of the best horses imported into this country; and what adds greatly to the value of his stock is, they are docile and good tempered.

The thing, however, which Mr. WATSON apparently takes the most pride in, is his Shetland and Welsh ponies. Of these he has a large stock, imported and reared by himself. We could select from this stock about a dozen breeding mares and a couple of stallions, which it would be pretty difficult to surpass in this country. It is amusing to see these diminutive creatures, capering about in droves of various colors over the farm. Some, full-grown, are not much over three feet high, while others are full four feet or more. The former would be a good match for a buffalo calf in harness, or a stout Newfoundland dog under the saddle.

Considerable quantities of fruit were formerly produced on this farm, but part of the orcharding being near to a large village, it was robbed every season, and the grass and other crops beneath the trees destroyed. This compelled Mr. W., at length very reluctantly to cut down the trees, for so long as they stood he could realize nothing from his land.

The farm buildings and stock-yards are well arranged here, and very commodious. The fences are in excellent order, and the mansion and grounds around are ample and in good taste. The view from the house is varied and beautiful. It extends up and down the East River, over a part of Long Island, the lower valley of the Bronx, and the hills around in Westchester. It is a delightful country residence.

Mr. WATSON deserves much credit for his improvements on and about his farm, and we are glad to see him take so much interest in them. He generally devotes one day out of the week to his farm, although still actively engaged in mercantile pursuits in this city.

CULTIVATION OF FLAX.

IN our last number we gave a copy of directions for the cultivation and preparation of flax, issued by LEADBETTER & Co., of Belfast, (Ireland.)

We have just received the last Report of the "Royal Society for the Promotion and Improvement of the Growth of Flax in Ireland," and we find that those directions were compiled from a carefully prepared appendix to this report, and are the result of thirteen years' experience, during which time the Belgian and other systems have been examined and tested by the Society, which is located at Belfast.

We find some additional matter in this report in relation to the treatment of flax, which no doubt will be of interest to those of our readers who agree with us, that the cultivation of flax in the United States should receive more attention, especially as the Russian war is likely to cut off for the present a large part of the supply of seed, (Riga,) and enhance its price.

We would remark that the directions in our last under the section "Saving the Flax," has reference to the patent mode of steeping with hot water, or steam, known as SCHENCK'S method; for it must not be inferred that the flax straw thus saved is ready for the spinning-mill without such steeping process, previous to *scutching* or separating the bark from the fibre—this is not the case,—but we shall speak of this again.

The following are the portions of the report omitted in our last weeks article:

Pulling—The time when flax should be pulled is a point of much nicety to determine. The fibre is in the best state before the seed is quite ripe. If pulled too soon, although the fibre is fine, the great waste in scutching and hackling renders it unprofitable; and if pulled too late, the additional weight does not compensate for the coarseness of the fibre. It may be stated, that the best time for pulling is, when the seeds are beginning to change from a green to a pale brown color, and the stalk to become yellow, for about two-thirds of its height from the ground.

Rippling—Which should be carried on at the same time, and in the same field, with the pulling. If the only advantage to be derived from rippling was the comparative ease with which rippled flax is handled, the practice ought always to be adopted; but, besides this, the seed is a most valuable part of the crop, being worth, if sold for the oil mill, £3 per acre, and if used for feeding stock of all kinds, at least £1 per acre. The apparatus is very simple. The ripple consists of a row of iron teeth screwed into a block of wood. This can be procured in Belfast, or may be made by any handy blacksmith.* It is to be taken to the field, where the flax is being pulled, and screwed down to the center of a nine feet plank, resting on two stools. The rippers may either stand or sit astride at opposite ends. They should be at such a distance from the comb as to permit of their striking it properly and alternately. A winnowing sheet must be placed under them, to receive the bolls as they are rippled off; and then the rippers are ready to receive the flax just pulled, the handfuls being placed diagonally, and bound up in a sheaf. The sheaf is laid down at the right hand of the rippler, and untied. He takes a handful with one hand, about six inches from the root, and a little nearer the top with the other. He spreads the top of the handful like a fan, draws the one-half of it through the comb, and the other half past the side; and, by a half turn of the wrist, the same operation is repeated with the rest of the bunch. Some, however, prefer rippling without turning the hand, giving the flax one or two pulls through, according to the quantity of bolls. The flax can often be rippled without being passed more than once through the comb. He then lays the handfuls down at his left side, each handful crossing the other, when the sheaf should be carefully tied up and removed. The object of crossing the handfuls so carefully, after rippling when tying up the beets for the steep is, that they will part freely from each other when they are taken to spread out on the grass, and not interlock, and be put out of their even order, as would otherwise be the case. If the weather be dry, the bolls should be kept in the field, spread on winnowcloths, or other contrivance for drying; and, if turned from time to time, they will win. Passing the bolls first through a coarse riddle, and afterwards through fanners, to remove straws and leaves, will facilitate the drying. If the weather be moist, they should be taken in-doors, and spread out thinly and evenly on a barn floor, or on a loft, leaving windows and doors open, to allow a thorough current of air, and turned twice a day. When nearly dry,

they may be taken to a corn kiln, (taking care not to raise it above summer heat,) and carefully turned, until no moisture remains. By the above plan of *slow* drying, the seed has time to imbibe all the juices that remain in the husk, and to become perfectly ripe. If it be taken at once from the field, and dried *hurriedly* on the kiln, these juices will be burned up, and the seed will become shrivelled and parched, little nutritious matter remaining. In fine seasons, the bolls should always be dried in the open air, the seed threshed out, and the heaviest and plumpest used for sowing or crushing. The light seeds and chaff form most wholesome and nutritious feeding for cattle. Flax ought not to be allowed to stand in the field, if possible, even the second day; it should be rippled as soon as pulled, and carried to the water as soon as possible, that it may not harden.

Watering—This process requires the greatest care and attention. River water is the best. If spring water has to be used, let the pond be filled some weeks, or months, if possible, before the flax is put in, that the sun and air may soften the water. That containing iron or other mineral substances should never be used. If river water can be had, it need not be let into the pond sooner than the day before the flax is to be steeped. The best size of a steep pool is 12 to 18 feet broad, and 3½ to 4 feet deep. Place the flax loosely in the pool, in one layer, somewhat sloped, and in regular rows, with the root end underneath; the tie of each row of sheaves to reach the roots of the previous one; cover with moss sods, or tough old lea sods, cut thin, laid perfectly close, the sheer of each fitted to the other. Before putting on the sods, a layer of rushes or rag-weeds is recommended to be placed on the flax, especially in new ponds. As sods are not always at hand, a light covering of straw may do, with stones laid on it, so as to keep the flax just under the water; and as the fermentation proceeds, additional weight should be laid on—to be removed as soon as the fermentation ceases, so as not to sink the flax too much in the pool. Thus covered, it never sinks to the bottom, nor is affected by air or light. A small stream of water, allowed to run through a pool, has been found to improve its color. In this case, if the pools are in a line, the stream should be conducted along the one side, and run into each pool separately, and the water of each pool run off, along the opposite side, in a similar manner. It will be sufficiently steeped, in an average time, from eight to fourteen days, according to the heat of the weather and nature of the water. Every grower should learn to know when the flax has had enough of the water, as a few hours too much may injure it. It is, however, much more frequently *under-watered* than *over-watered*. The best test is the following: Try some stalks, of average thickness, by breaking the *shove*, or woody part, in two places, about six or eight inches apart, at the middle of the stalk; catch the broken bit of wood, and if it *will pull freely out, downwards, for that length, without breaking or tearing the fiber, and with none of the fiber adhering to it*, it is ready to take out. Make this trial every six hours, after fermentation subsides, for sometimes the change is rapid. Never lift the flax roughly from the pool, with forks or grapes, but have it carefully handed out of the flax-drain by men standing in the water. It is advantageous to let the flax drain twelve to twenty-four hours, after being taken from the pool, by placing the bundles on their root ends, close together, or on the flat, with the slope; but the heaps should not be too large, otherwise the flax will be injured by heating.

There are two new systems of steeping or retting flax, on a large scale, now in operation. The one is by hot water, or what is called Schenck's method; and the other by steam, or Watt's method. In both cases they are carried on, on a large scale, by persons who purchase the flax straw from the farmers, as pulled and dried on the Courtrai system described at page 133, under caption "Saving the Flax."

Spreading—Select, when possible, clean,

short, thick pasture ground for this operation; and mow down and remove any weeds that rise above the surface of the sward. Lay the flax evenly on the grass, and spread thin and very equally. If the directions under the head of rippling have been attended to, the handfuls will come readily asunder, without entangling. Turn it two or three times while on the grass (with a rod about eight feet in length, and an inch and a half in diameter,) that it may not become of different shades, by the unequal action of the sun, which is often the case, through inattention to this point. Turn it when there is a prospect of rain, that the flax may be beaten down a little, and thus prevented from being blown away.

Lifting—Six to eight days if the weather be showery, or ten to twelve if it be dry, should be sufficient on the grass. A good test of its being ready to lift is, to rub a few stalks from the top to the bottom; and, when the wood breaks easily, and separates from the fibre, leaving it sound, it has had enough of the grass. Also, when a large proportion of the stalks are perceived to form a *bow and string* from the fibre contracting and separating from the woody stalk. But, the most certain way is, to prove a small quantity with the hand-break or in a flax mill. In lifting, keep the lengths straight and the ends even, otherwise great loss will occur in the rolling and scutching. Let it be set up to dry for a few hours, and afterwards tie it up in small bundles; and, if not taken soon to be scutched, it will be much improved by being put up in small stacks loosely built, with stones or brambles in the bottom to keep it dry, and allow a free circulation of air. Stacks built on pillars would be the best.

Drying—By fire, is always most pernicious. If properly steeded and grassed no such drying is necessary; but, to make it ready for breaking and scutching, exposure to the sun is sufficient. In some districts it is put to dry on *kilns*, in a damp state, and is absolutely burned before it is dry, and the rich oily appearance of the flax is always greatly impaired. On this point the Society can scarcely speak too strongly, as the flax is either destroyed or rendered not worth one-half of what it would be if properly prepared.

Breaking and Scutching—If done by hand, should be on the Belgian system, which is less wasteful than that practised in Ireland. If by milling, the farmer will do well to select those mills in which the improved machinery has been introduced. The Society would also recommend that the farmer should endeavor to have his flax scutched by a mill-owner who pays his men by the day, and not by the stone, even if it should cost him higher in proportion; the system of paying the scutchers by the stone rendering them more anxious to do a large quantity in the day than to produce a good yield from the straw.

This mode of watering and drying is adopted by farmers in Ireland who grow flax in limited quantities, and are not within reach of what is now called the improved steeping process. (SCHENCK'S or WATT'S.)

In our next we purpose giving some hints as to the value of flax seeds for oil and for feed.

LUCKY YIELD FROM PLOWING.—A colored man, while plowing on the farm of Mr. S. Hulster, about a mile from Richmond, Va., struck an old iron pot containing a number of Mexican dollars, amounting, it is said, to \$150 or \$200. The deposit of this treasure was said to have been made by an old man named James Housen, a Creole, who was possessor of this farm for several years previous to 1816.

FLAX.—Great Britain has imported from Russia \$26,000,000, worth of flax every year, and as the ports of that nation are now closed by the war, the demand will be greater than it has previously been.

* The best ripples are made of half-inch square rods of iron, placed with the angles of iron teeth the rippers, 3-16ths of an inch asunder at the bottom, half an inch at the top, and 18 inches long, to allow a sufficient spring, and save much breaking of flax. The points should begin to taper 3 inches from the top.

For the American Agriculturist.

KENTUCKY CORRESPONDENCE.

FARMING AROUND LEXINGTON, &c.

I HAVE been stopping the last ten days in the "garden of Kentucky," the vicinity of Lexington, Fayette County, and have been able to see and learn much that has interested me, and which would also interest many of your readers, I presume, could they see the same. The readers of the *Agriculturist* in former years have been favored with some interesting accounts of this part of the State of Kentucky, and the fairs which have been held at Paris and Lexington, and your present readers might also be interested to hear something more of this county, its agricultural productions, stock, &c., &c.

The soil of this region is exceedingly fertile and inexhaustible. I repeat it is *inexhaustible*, else it had been long since ruined. It is of that variety of lime-stone which contains siliceous carbonate of lime in large quantities, yielding an abundance of food of the best kind for grazing, and for this purpose it is diligently improved. Stock of almost all kinds are here bred, probably in a greater abundance, and of a superior quality to any other State in the Union. No effort is left untried to procure the very best animals that can be found from which to breed, and when procured no pains is spared in keeping up and improving even upon these. I have had the pleasure of forming the acquaintance of the best stock breeders of the country, and of enjoying their hospitality, and can truly and cheerfully bear witness to their spirit of enterprise, their pride of character, and to that large amount of those characteristics which make up the true Kentucky gentlemen. Some of them are not unknown to the readers of the *Agriculturist*, nor to the most distinguished stock breeders throughout the country.

Great attention is given here to the breeding of jacks and mules, some of the finest in the country can here be found, and at the present time it is one of the most profitable branches of husbandry pursued. I have seen several sucking mules for which from \$80 to \$100 dollars each had been paid as soon as they stood upon their feet; this, of course, is an extraordinary price for extra colts, but ordinary ones are high—and so it is with all kinds of stock, such as cattle, horses, sheep, swine, &c., all of which kinds they have in abundance here, except perhaps sheep, which are more prized for the size of ear-case than for the quality of wool—and of course the larger varieties are bred.

The high prices which have been paid for imported stock by the farmers here, and also a which they hold animals which they have bred from them, would astonish many of our conservative farmers at the north, though but little thought of here.

This part of Kentucky, to one who has so long lived in the woods as has the writer, appears almost like a fairy land; exceedingly fair at least. Every acre is brought under tribute. The forests are all in grass, and for grazing. The appearance of the country now is truly pleasing; the trees have put forth their foliage; clover and other grasses, and the winter grain, of which latter but little is grown, cover the earth with their beautiful green. There is one thing, however, which rather surprised me, viz, the little attention given to the cultivation of good fruit. Most of the orchards that I have seen are very old and are nearly worthless. I have seen but few young orchards, and find but little interest felt in fruit culture. This climate is undoubtedly favorable for fruit, and it must be a want of enterprise in part, which causes this inattention to so important a branch of husbandry.

I have many more things to write about, and more in detail, and will endeavor to do so soon—at least, as I can do so authoritatively, and hope to give your readers something of more interest.

JOSEPHUS.

Lexington, April 28, 1854.

For the American Agriculturist.

WHAT ARE WE TO DO FOR FENCE TIMBER?

SINCE I have been a subscriber to the *Agriculturist*, I have derived much pleasure as well as instruction from the perusal of its pages. But there is one subject, second to none in importance, upon which but little has been said. I refer to the management of timber land. The question is often asked among farmers, what are we to do for fencing timber and fuel? Land is becoming so valuable, that farmers are clearing out their woodlands as bare as possible, for all surplus forest land is considered dead capital. As for fuel, the increased facilities for transportation will enable us, in a few years, to substitute coal for wood. But as yet there has been no material used for fencing, that seems likely to supersede the use of timber.

The usual practice is to cut out the dying or best matured trees, and under this process our forests are becoming thinner every year, as the stock ranging at large devour all the young sprouts, and prevent any new growth.

Some advocate cutting all the timber, both large and small, as you go, and allow it to sprout up again. But even if this were better economy, which appears to me doubtful, it would be necessary to keep the woodland fenced off by itself—a very expensive operation.

Some suggestions from you or your correspondents on this subject, would be both interesting and useful to a YOUNG FARMER.

A good subject for some of our correspondents. See first article in No. 24 of last volume.

A WOMAN ON THE "BONE QUESTION."

SEVERAL papers have recently been discussing the question, "Will ashes dissolve bones?" We gave our own opinion on page 9 of this volume, (No. 1.) The *Country Gentleman* recently published an elaborate article on the subject from the pen of Prof. NASH, which somewhat commends a process said to be practical. Miss SWISSHELM pitches into the article after this fashion:

The agricultural papers are positively discussing the question, "Will ashes dissolve bones?" Ay, and discussing it as gravely as if it were a profound mystery. One agricultural paper says ashes will dissolve bones, and another says they will not; which only proves that every agricultural paper should have one housekeeper in its editorial corps, to keep them from being ridiculous occasionally.

Any western farmer's wife or daughter could answer this mooted question on the instant, and would at once say, "that depends upon the ashes."

Any ashes that will make soap will dissolve bones, if you put enough on; but when so dissolved, they are rather an expensive manure. We should as much think of sending to the chandlers for a dozen boxes of soap, and putting a quarter of a pound on each hill of corn, as putting all the bones of one kitchen into hog-heads, dissolving them with ashes, and using the mixture as did the writer in the *Country Gentleman*.

His was rather an expensive economy. His manure was simply very strong, unrefined soap, which, with a very little difference in the manner of preparing, would have done all the washing and cleaning in the family, when, in the form of refuse suds, it should have been poured on a bed of loam or clay to make manure for the cornfield, or around the roots of the grape vines and fruit trees, as a liquid manure.

The only difference between the plans of making clean soap and the dirty mixture he did make, would be to empty the ashes into a hopper, put the water on them there, let it run off in the form of lye, pour this upon the bones, and either boil them in it or let them stand in the

sun. The bones would dissolve, the limey part settle to the bottom, and the animal, fatty, and glutinous matter unite with the lye to make the soap.

One hogshhead full of bones and good ashes, would make a full hogshhead of soap, leaving the leached ashes and phosphate of lime from the bones, into the bargain.

But quick lime used in this same manner will dissolve bones, until they are good food for plants, and this is cheaper than soap ashes.

VALUE OF NITRATE OF SODA AS A MANURE.

IN very many sections of our country, this article is now extensively used as a stimulant for soils, and especially for those cultivated in grain and grass. In our late agricultural journals of the better class, I have lately noticed some very interesting accounts, all going to confirm the fact that nitrate of soda is an economical and efficient fertilizer, particularly when applied to the above crops. In a Liverpool paper, the following has lately appeared, and I copy it, in hopes that some who may have hitherto questioned the utility of this and similar applications, may be induced to test its virtues for themselves, and thus be enabled to judge understandingly whether it is capable of being made an economical adjuvant in the great and important process of vegetable nutrition, or not.

"On the 6th of May last," says the writer, "six alternate ridges of wheat, measuring one acre, two roads, and five perches, were sowed with five cwt. of nitrate of soda. In a few days the difference between the ridges with the nitrate and the intervening ridges of the same size, could be discerned at a considerable distance from the field, which difference continued throughout the summer. The two sorts have been reaped, threshed, measured and weighed separately, and the following is a correct account of the produce:

"Nitrated wheat, 48 bushels, weight per bushel, 66 lbs. Of that portion of the field on which no nitrate was sowed, the produce was 23 bushels, weight per bushel 56 lbs. Straw of the same, one ton, five cwt., one qr., two lbs. The quality of both is represented as inferior.

"It will at once occur to every reader, that the quantity applied in this case, was excessive. Had the application been limited to one-half or two-thirds the quantity, its action, on the crop would, in all probability, have been more efficient."

So far as my own observations extend, and I have made some few experiments with this article, it appears to be a most valuable and efficient manure, and we have no doubt, that it will be so regarded by all who try it, *judiciously*, either on grain or grass.

One great and important advantage resulting to the farmer from the use of these concentrated manures, is the ease and cheapness with which they may be transported and applied. It costs but a mere trifle to dress soils with them, while the expense of manuring wholly with compost, or other manures, subtracts a large sum from the income of the most successful and lucrative crop. That a perfectly barren, or totally exhausted soil can be restored, and rendered productive in cereals, or even in the most valueless vegetables of the cultivated classes, without the joint and associated action of humus, no farmer whose experience, or whose knowledge of the practical sciences will gainsay. Its action even upon emasculated soils would no doubt be beneficial, yet it would not be sufficiently so, to insure the full development and perfect maturation of valuable grain. In conjunction with humus, or putrescent and rapidly-decomposing vegetable or animal organisms, it would tend powerfully to the protection of the great primal object of all agricultural enterprise—the wealthy development and perfection of the vegetable systems to which it is applied. As a top-dressing

for timothy, nitrate of soda is said by those who have used it, and contrasted its effects with those of other mineral and vegetable manures, to be superior to any article now known.—*B. in Germantown Telegraph.*

HOW TO DETERMINE THE HEIGHT A COLT WILL ATTAIN WHEN FULL GROWN.

MR. JAS. R. MARTIN, of Lexington, Kentucky, gives out the following upon this point:

I can tell you how any man may know within half an inch, the height a colt will attain to when full grown. The rule may not hold good in every instance, but nine out of ten it will. When the colt gets to be three weeks old, or as soon as it is perfectly straightened in its limbs, measure from the edge of the hair on the hoofs to the middle of the first joint, and for every inch, it will grow to the height of a hand of four inches when its growth is matured. Thus if this distance be found sixteen inches, it will make a horse sixteen hands high. By this means a man may know something what sort of a horse, with proper care, he is to expect from his colt. Three years ago I bought two very shabby looking colts for twenty dollars each, and sold them recently for three hundred dollars. So much for knowing how to guess properly at a colt.

Well, Mr. JAMES R. MARTIN has "his say" as above. We say, give us a decent breed to start with, and the future height will depend altogether upon what care and feed the animal receives. Another suggestion to be always kept in mind, is, that height is not the only essential good quality for a horse, though it may be for a Shanghai.

For the American Agriculturist.

TWO FARMERS CONTRASTED.

As you have so far broken the rule which barred you from publishing articles not *strictly agricultural* as to give place to occasional jottings, I thought perhaps your readers might be interested in a couple of incidents that fell under my notice the last year. Although small in themselves, they convey a lesson of much import, and as the best coloring could not give them the least beauty, I shall content myself by giving the facts just as they occurred, hoping that while the example of the one may be condemned, that the other may be properly appreciated.

Having business with the agricultural portion of the citizens of one of our Middle States last autumn, I had good opportunity to note many almost *curiosities* that came under my observation in various ways. I found some sections where the tillers represented so many different nations of the East, and so many different languages were spoken, that I sometimes required more than one interpreter to accompany me. In one of my business excursions I called on one of these tillers of the soil for a few moments, and having completed my business, was about leaving when a bright-eyed little boy came skipping along, holding in one of his hands a large, fair apple, which was partly red colored. The animated sparkle of his eye, and the intelligent appearance of his countenance completely captivated me, and I felt an interest in him from that moment. Said he:

"Pa, see what a pretty apple I have found, half red and half green, and it is sweet, and I want to know what makes this apple sweet?" "Cause it grew so," said the father gruffly. "Well, pa, all t'other apples that have red on them are sour, and why isn't this sour too?" "Cause didn't grow so," more gruffly than before. "Well, pa, do tell me what makes apples sweet?" "Cause they grow so *I tell you,*" (this was said sternly and in a very emphatic manner, accompanied with a menacing gesture;) "and if you don't stop asking your foolish questions I will *whip* you again—I should think that

I had whipped you enough to whip all the foolish questions out of you, but you don't know how to say any thing but ask questions. Now hold your tongue and be off." The little boy said as he turned to obey, "Pa, I'll try not ask more questions." This was in a subdued tone, and his face was suffused with tears, while the elasticity and ardor of his movements were visibly damped. I loitered a moment to see what might follow, when the father turned to me and said, "that boy is almost *spilt* by going over to my neighbor SMALL's, who has a couple boys about his age, and Mr. SMALL wants my John to come over sometimes and *larn* with his boys. He's *allers* telling them something when he's at work about felseophy as he calls it, and I wish he'd keep it to himself, for boys oughtn't to know too much, and if he don't quit telling my John so much stuff, I shall keep him at home, I shall."

As I had previously finished my business, and seeing but little chance to help little John, I resolved to learn what kind of a neighbor Mr. SMALL was. I soon after called and found him to be a farmer and true gentleman. Every thing showed that he was as near master of his profession as any in our country. Every tool had a place, and was in its place, too, and so arranged as to be come-at-able when wanted without any needless waste of time, while the general appearance of his farm showed that they had been used when needed. I soon had an opportunity to see the two boys that John's father had spoken of, as two active little lads joined us, and the father introduced them as his sons. There was none of that shyness we often see in country lads, nor of the waywardness that we sometimes observe in city lads, but a sort of manliness that makes one feel acquainted from the first sound of their voice. They were true types of their father. The elder held in his hand an ear of corn partly red, and when a pause in our conversation ensued he said to his father: "Pa, may I ask a question?" "Yes," said Mr. SMALL, "if it is not a long one." "Well, you see this ear of corn has some red kernals in it, and Bub and I cannot agree how it could come since there was none planted in our field that was red." I begged Mr. SMALL to let me hear what explanation his son would give, as he was about to speak. Mr. SMALL said that he doubted the ability of either to give the true cause, but that each should state his views since he had no recollection of ever explaining to them the reason for such occurrences; so turning to the elder he said: "Edwin, let me hear what you have to say, and then Bub shall have his turn at an explanation."

We had reached a beautiful eminence as Edwin commenced and said: "You remember, pa, to have told us that unless the pollen of the anthers (which grow on the upper end of the cornstalks) should fall or be carried by the wind to the *silks* or pistils of the ear-shoot, there would be no corn on the cob. Now if the pollen can be carried by the wind as well as by the hand, as you showed us, there is no reason why the wind should not blow the pollen from Mr. P.'s corn to ours, although it is near a half mile off, and the wind blowed from his corn-field toward ours, too, from the time it was *silked* until it was full in milk, and I told Bub that this was the most likely way that it came that we have red corn in ours this year." "Now, Bub, for your turn," said Mr. SMALL. "Well, pa," said he, "I have changed my mind some since brother has been talking, as it has put me in mind of what I read in the *Agriculturist*. The paper said that it was very difficult to raise pure seed of any kind, for there were so many bees and other winged insects that were all the while going from one flower to another, and carrying the pollen on their bodies, thus mixing melons, cucumbers, squashes, corn, as well as all other such plants and vegetables, so that it must be very difficult to raise any pure variety. I can only wonder now how we find them so pure as they are, but there is something else where I am more puzzled, and that is to find out how it is that so small a speck of a fine yellowish pow-

der can impart an influence to a yellow variety of corn that shall make red kernals grow on the same cob, when the juice that supports both the red and the yellow corn comes through the same source to the ear; can you explain father, for I find nothing in any book that tells me?"

"Well, my sons, you have between you spun out a long story, and have reasoned or quoted correctly, too; but how to answer the question Bub put, will take more time than I now have, but we must all study, and when we have time we will see whether there is any satisfactory reasons given in any of our books."

I heard much more such conversation, that was not only interesting, but instructive, so much so, that I determined to pay another visit. Should this prove acceptable, I will try to give you the history of the other call at some future time. J.

Morristown, N. J.

GERMAN AGRICULTURE--USEFUL HINTS.

EACH German has his house, his orchard, his road-side trees, so laden with fruit, that if he did not carefully prop up and tie together, and in many places hold the boughs together with wooden clamps, they would be torn asunder by their own weight. He has his plot for corn, man-gold wurtzel, for hay, for potatoes, for hemp, &c. He is his own master, and he, therefore, and every branch of his family, have the strongest motive for constant exertion. You see the effect of this in his industry and his economy.

In Germany nothing is lost. The produce of the trees and cows is carried to market; much fruit is dried for winter use. You see it lying in the sun to dry. You see strings of them hanging from their chamber windows in the sun. The cows are kept up for the greater part of the year, and every thing is collected for them. Every little nook, where the grass grows by roadside, and brook, is carefully cut with the sickle, and carried home on the heads of the women and children in baskets, or tied in large cloths. Nothing of any kind that can possibly be made of any use, is lost; weeds, nettles, nay, the very goose grass which covers waste places, is cut and taken for the cows. You see the little children standing in the streets of the villages, in the streams which generally run down them, busy washing these weeds before they are given to the cattle.

* They carefully collect the leaves of the marsh grass, carefully cut their potato tops for them, and even if other things fail, gather green leaves from the woodlands. One cannot help thinking continually of the enormous waste of such things with us—of the vast quantities of grass on banks, by roadsides, in the openings of plantations, in lanes, in church-yards, where grass from year to year springs and dies, but which, if carefully cut, would maintain many thousand cows for the poor.

To pursue still farther this subject of German economy. The very cuttings of the vines are dried and preserved for winter fodder. The tops and refuse of hemp serve as bedding for the cows; nay, even the rough stalks of the poppies, after the heads have been gathered for oil, are saved, and all these are converted into manure for the land. When these are not sufficient, the children are sent into the woods to gather moss, and all our readers familiar with Germany will remember to have seen them coming homeward with large bundles of this on their heads. In autumn, the fallen leaves are gathered and stacked for the same purpose. The fir cones, which with us lie and rot in the woods, are carefully collected and sold for lighting fires.

In short, the economy and care of the German peasants are an example to all Europe. They have for years, nay ages, been doing that, as it regards agricultural management, to which the British public is but just now opening its eyes. Time, also, is as carefully economized as every thing else. They are early risers, as may well be conceived, when the children, many of

whom come from a considerable distance, are at school at six in the morning. As they tend their cattle or their swine, the knitting never ceases, and hence the quantities of stocking and other household things which they accumulate are astonishing.—*Howitt.*

A CHLOROFORMED HORSE.

MESSRS. CHEESEMAN & DODGE have a valuable roadster who resolutely eschews all farriers, being determined to go as nature provideth, and as we often see certain poor bipeds of another genus go from necessity—*shoeless*. The horse had long contracted this habit, while every means had been tried, from the nose twitch, to that of casting and blinding with straps, &c., occupying the attention of some dozen men in a doubtful issue to set a shoe. This morning as I happened in, at the stable, preparations were in progress for a determined shoeing. The fine fellow had been kept without his feed for twenty-four hours, hoping that fasting—that terrible mollifier of mettle—might aid the operation. I determined to interfere in behalf of the noble fellow. I suggested chloroform, and procured a half pound bottle. A groom led the horse from his stall into the open space, and while he held him by the halter with one hand, applied a saturated sponge holding about two ounces of chloroform to his nostrils with the other. After a few inhalings, he became quite passive; and in 10 minutes, or less, was perfectly ready to be shod, which was effected through all the various manipulations, with the same unconcern that any old nag would do, who having traveled a flinty road, gloried in a new set of shoes well hammered on. He evinced no symptoms of sensation, nor flinched in the least during the clinching process. When one foot was finished, in taking up another, he seemed not to realize the necessity of aiding himself to gravitate. Yet his eyes seemed bright and natural. The experiment was deemed perfectly satisfactory, and an increased value laid upon the horse. There was about a fourth of a pound of chloroform used, but a portion, perhaps one-third of it, was wasted in appliance. The operation over, the horse was led out and exercised for a few moments, when his feed was given to him, and apparently relished with great gusto.—*Xenia News.*

FRYING-PANS.

A SINGLE law passed by Congress, supposing it had the power, and obeyed by the people, would effect a great reform in the public health, diminish the business of doctors and the demands for drugs, and prove of incalculable benefit to this and future generations. Thus: Be it enacted, that on the first day of January, 1855, every frying-pan in the United States be broken up, and sold for old iron, and that no more be manufactured henceforth for ever. Frying is the most unwholesome of all modes of cooking. Every thing cooked by this method is saturated with fat or butter, rendered tough, covered with empyreum oil, and made as unfit as possible for the human stomach. No dyspeptic should ever eat any thing fried, and no one should ever do so who would avoid becoming a dyspeptic. Let your food be boiled or roasted, or broiled, or baked even—any thing but fried. Frying meat is the worst possible mode of cooking; destroying whatever good qualities it may possess, and exaggerating all its badness. And all this comes of having frying-pans, spiders, and other cast iron abominations for making food unwholesome. Good people, beware of the frying-pan; beware of the fat which it scorches; and beware of the meat, and fish, and eggs, which it renders unfit for food and difficult of digestion, that your days may be long in the land.—*Nichols Journal.*

BENEFIT OF BEES TO FRUIT TREES.—It is stated that bees greatly improve the fructifica-

tion of fruit trees. Orchards in which several hives are kept, always produce more fruit than others in which there are none. In the provinces on the Rhine the fruits are more abundant and finer than in any other part of Germany, and there it is the custom to keep large quantities of bees. Plants, too, which bees visit, thrive better in the neighborhood of hives.

ANIMALS FORTELLING THE WEATHER.

INSTINCT AND REASON.

It is said that the woodcock in New-Jersey is building its nest, this year, in open and moist places; and old huntsmen predict in consequence that the summer will be a dry one. There was a time when science, or what was called such, laughed at signs of this description, as no better than "old women's tales;" but though many of them are still unreliable, a larger observation of nature has taught that animals have an instinct, which not unfrequently becomes prophetic, as in this example. At last year's meeting of the American Association for the advancement of Science, a curious paper was read on this subject, by Mr. N. B. Thomas, of Cincinnati, who had, for several years, studied the habits of animals in reference to the indications which they might afford respecting the weather. He showed that birds, if the season was to be a windy or wet one, built their nests in sheltered places; but, if it was to be dry, in localities more exposed; that certain kinds of snails always came out, and crept up the limbs of trees several days before rain;—and that locusts, wasps, and other insects were invariably to be found under leaves, and in the hollow trunks of trees, hours before a storm set in.

The sagacity thus displayed, if we may call it such, seems to put the higher reason of man to shame. In vain do our most expert savans endeavor to predict the character of an approaching season, or even to foretell, a few days in advance, the condition of the weather. The woodcock that unerringly fixes its nest in the spot best suited for the coming summer, or the snail whose tubercles begin to grow ten days before the rain they are preparing to receive, appear, at first sight, to surpass the more developed men. But the inferiority of those lower orders of animals is in the quantity of their endowments, rather than in the quality; they have a single faculty developed to an extraordinary degree, while man has, as it were, faculties almost infinite. In thus adapting each organization to its special position, the wisdom of the Creator is forcibly exhibited.—*Philadelphia Ledger, May 9.*

THE DIGGING MACHINE.—An implement under the above designation, invented by Mr. Matthew Gibson, of Newcastle-upon-Tyne, already known to agriculturists as the originator of the Patent Northumberland Clod Crusher, has been daily at work for several weeks past on the farms of Sir Hedworth Williamson, Bart., at Monkwearmouth, and of Mr. Barnes, at Whitburn, near Sunderland. During the past week the powers of this admirable appliance to agricultural tillage have been further tested on the farms of Mr. T. T. Hall, of Ovingham, Tyneside; Mr. R. W. Swan, of Wallsend, and Sir W. C. Trevelyan, Bart., of Washington, Northumberland. Its powers, in all the trials referred to, were exhibited on tough clayey soil, and working at a depth of 9 inches, at the rate of three-quarters of an acre per hour, with four horses, throughout the whole day, with no more exertion than that required for ordinary plowing. The implement consists of a number of cylinders of about three and a half inches in diameter and six inches long, revolving on a fixed axle. On each of the cylinders is cast a disc, twelve inches in diameter, which is furnished with ten teeth or prongs, of hardened malleable iron or steel, of a curved or cat-claw form, springing from its periphery, and which, partly by the weight of

the implement, and partly by the strain of draught, is forced into the ground, and, as the implement advances, digs or forces up the soil—in fact, each prong performs precisely the office of a pick or hack in loosening the soil. This forking up or loosening of the soil is not the only important office of the implement, but from the curved form of the teeth, it brings all roots and fibrous matter within the depth of its operation to the surface, thus producing a clean as well as a free tillage, or at once acting most effectively as a grubber in bringing up root-weeds, and at the same time performing the most important function of the plow in aerating the soil. The implement is mounted on a strong frame, partly of cast and partly of malleable iron, and furnished with a simple but most ingenious apparatus for regulating the depth of its working in the soil.—*Mark Lane Express.*

CLAIMS OF AGRICULTURAL PATENTS

FOR THE WEEK ENDING MAY 2, 1854.

HAY KNIVES.—Seth Whalen, of West Milton, N. Y.: I claim attaching a blade made of sheet steel, and bent at its upper extremity so as to stand out from the handle, directly to and in the center of the handle, and between the arms, whereby a great saving in time, labor, and expense in making hay knives can be effected, and an equal distribution of the power of the operator exerted in a perfect manner upon the edges of the knife, and it consequently caused to act more effectually upon the hay than the ordinary knife, as set forth.

STRAW CUTTERS.—Robert Hogin, of Barnesville, Ohio. I disclaim the use of an endless belt for the purpose of feeding the straw or other material to the knife.

But I claim the straw rest for supplying the straw to the knife, said straw rest or rack being carried the entire length from rear to front end of the cutter box by an intermittent forward motion, as set forth.

HARROWS.—W. F. Pagett, of Stone Bridge, Va.: I claim, first, the constructing harrow beams of sections of iron with the teeth wrought solid upon and with them.

Second, the combination therewith and arrangement of cross rods with screw and taps, and pipes or tubes, or their equivalents, to keep the beams and sections in their places.

COUPLINGS OF ENDLESS CHAIN HORSE POWERS.—W. E. Arnold, of Rochester, N. Y.: I claim the lips, the recesses, and the hooks, by which the series of platforms are united into a continuous chain platform, without any other fastenings than those afforded by their own peculiar shape, and thus avoiding the use of links, bolts, rods, or similar fastenings, as described.

SPRING "SPORT."—Our contemporary of the *Clinton Courier* condemns in strong terms the practice of shooting birds in pairing time, and is somewhat sanguinary in his remarks. Here is his article, which we commend to the attention of those bipeds who deem it manly sport to blow a little bird to pieces!

"The editor of the *Germantown Telegraph* says that he saw, last week, in Philadelphia market, several large bunches of robins, which had been shot and brought there for sale. We don't desire the death of any man, but if some humane sportsman would only manage to put shot enough in the legs of the murdering vagabond who killed those birds, to keep him busy at home during the remainder of the spring, he would confer an especial obligation upon us. A man who would slaughter an innocent bird in "pairing time" would shoot his own grandmother, if her hide were marketable. If white slavery were legal, we would try and buy that chap for the sake of the fun of driving him to market in fly-time.

THE difficulty is not so great to die for a friend, as to find a friend worth dying for.

Horticultural Department.

To HORTICULTURISTS.—Our weekly issue of so large a journal, gives us ample room to devote to the different departments of cultivation, and we have commenced with this volume, to allot a separate space to Horticulture. We have secured additional efficient aid in its conduction, and we invite horticulturists generally, to send in their contributions on all subjects interesting and instructive to those engaged in similar pursuits with themselves. We are receiving the leading foreign and domestic horticultural journals, and shall be abundantly able to bring promptly before our readers all that transpires, which may be new and useful.

BROOKLYN HORTICULTURAL SOCIETY.

FIRST SEMI-ANNUAL EXHIBITION.

It has seldom been our pleasure to come in contact with a Society which combined so many elements of success, as does the lately organized Horticultural Society of Brooklyn. We insert here for convenient reference a list of the officers of the Society.

JOHN W. DEGRAUW, *President.*

Vice Presidents.

Henry C. Murphy, John Maxwell, Henry A. Kent, Stephen Knowlton, Smith J. Eastman.

W. S. Dunham, *Treasurer.*

Delos W. Beadle, *Cor. Secretary.*

Milton Arrowsmith, *Rec. Secretary.*

The objects of the Society are briefly stated as follows:

The objects of this Society are to collect and diffuse correct information on all subjects connected with Horticulture, and to promote a taste for the science.

It is designed to have a monthly exhibition at the Society's Rooms in the Brooklyn Athenaeum; and a Spring and Fall exhibition, and to award prizes to those who exhibit the finest specimens.

Members pay an annual due of Three Dollars, which entitles them, with their families, (or in the absence of a family, with two friends,) to admission to all the exhibitions of the Society.

The regular meetings are held at the Society's rooms in the Brooklyn Athenaeum, on the first Thursday evening of every month.

This Society already numbers about five hundred members, and there is exhibited on the part of all, both officers and members, a degree of enterprise which is truly commendable. No better proof of this could be asked than was shown in getting up and carrying on the semi-annual exhibition, which was held on Wednesday, Thursday, and Friday of last week. It would be useless to attempt to convey upon paper, any thing like an adequate description of the panoramic beauties displayed in the Athenaeum Hall. There were a dozen to twenty fine plants which we think have not been on exhibition before in this part of the country. Among these we may name *Cissus discolor*,—a beautifully variegated climber, allied to the grape vine,—and *Begonia Xanthina*, quite new and rare.

Perhaps the most generally attractive object was the specimen leaves and flower of the world renowned *Victoria Regia*. These were brought from Philadelphia, by Mr. R. R. SCOTT, and were kindly furnished by CALEB COPE, Esq., from the first successfully cultivated plant in this country. The cultivation of this plant

alone has cost over \$3000. Only three others have yet been grown to flower on this continent. The leaves of this plant have attained a diameter of upwards of eight feet. The largest one on exhibition here, measured about five feet. They were shown in a large tank of water built expressly for them. The Society expressed themselves much indebted to Mr. GRAFF, gardener to Mr. COPE, for his attention and assistance in sending this plant, and also to Wm. H. GATZMER, general agent of the N. Y. and Philadelphia R. R. for special favor in forwarding it.

We may also name as interesting specimens the Black Tea plant of commerce; *Cattleya labiata*, a choice orchid; the King of the Forest, *Chrysobaphus Roxburghi*; a new variety of the Wax plant; *Nepenthes distillatoria*, or Pitcher Plant; Allspice Tree (*Myrtus pimento*); India Rubber Tree; New-Holland Gum Tree, &c.

As will be seen by the premium list, Mr. MENAND, of Albany, was one of the largest and most successful exhibitors. This gentleman is one of the most successful plant cultivators in this country.

The plants were tastefully arranged in the hall, and there were just choice specimens enough exhibited to fill the space without over crowding. The rearing of these plants showed much past labor, skill, taste, *genius*; and the result of this exhibition upon the popular mind will be a strong impulse to cultivate a taste for the beautiful in nature.

The following list of premiums will give a further idea of the specimens exhibited, and of the successful exhibitors.

HOT-HOUSE PLANTS.

For the four best specimens, Martin Collopy, \$11 00
For a dissimilar collection, Geo. Hamlyn, gardener to Wm. C. Langley, 8 00
For the second best, Louis Menand, Albany, 3 00
Second best, single, ditto, 2 00

GREEN-HOUSE PLANTS.

Best dissimilar collection, Louis Menand, Albany, 12 00
Second best, Martin Collopy, gardener to Jas. H. Prentice, 8 00
The first best four specimens, Louis Menand, Albany, 8 00
The second best four ditto, Geo. Hamlyn, gardener to Wm. C. Langley, 5 00
The best single specimen, Louis Menand, Albany, 3 00
The second best, Martin Collopy, gardener to Jas. H. Prentice, 2 00
The best specimens of Pelargoniums, Geo. Hamlyn, gardener to Wm. C. Langley, 8 00
The best fancy Geraniums, James Weir, 3 00
The best dissimilar collection of Calceolaries, H. A. Graef, 5 00
The best six specimens, Martin Collopy, gardener to Jas. H. Prentice, 5 00
The second six do., Geo. Hamlyn, gardener to Wm. C. Langley, 3 00
The best six varieties of Cinerarias, Geo. Hamlyn, gardener to Wm. C. Langley, 4 00
The best six specimens of Fuchsias, Martin Collopy, gardener, to Jas. H. Prentice, 6 00
Second best six specimens ditto, Poynter & Canner, 4 00
The best six specimens of Verbenas, Geo. Weir, 3 00
The best four specimens of Gloxinias, Martin Collopy, Gardener to Jas. H. Prentice, 4 00
The second best four do., do., Geo. Hamlyn, gardener to Wm. C. Langley, 2 00

The best single specimen of Stockgilly, Geo. Hamlyn, gardener to Wm. C. Langley, 4 00
The best three specimens of Ericas, Louis Menand, Albany, 5 00

CUT FLOWERS.

The second best collection of Roses, James Weir, 2 00
The best twelve varieties Pansies, James Weir, 2 00
The second best do. do., Martin Collopy, gardener to Jas. H. Prentice, 1 00
The best twelve varieties of Hyacinths, J. W. Degrauw, 3 00
The second best do. do., J. W. Towt, 1 00

BOQUETS, BASKETS, &c.

The best pair of hand Boquets, W. & J. Park, 3 00
The second best do., James Weir, 2 00
The Parlor Boquet, James Weir, 4 00
The second best ditto, Archibald Henderson, 3 00
The best basket of Flowers, W. & J. Park, 4 00
The second best ditto, ditto, Archibald Henderson, 3 00

FRUIT.

The best size pots of Strawberries, Geo. Thompson, \$3 00

VEGETABLES.

The best 24 stalks Asparagus, John Ferguson, gardener to H. A. Kent, 2 00
The second best, Geo. Hamlyn, gardener to Wm. C. Langley, 1 00
The best Mushrooms, John Ferguson, gardener to H. A. Kent, 2 00
The best brace of Cucumbers, Jas. Goldie, gardener to R. L. Colt, Patterson, N. J., 3 00
The second best ditto, Geo. Hamlyn, gardener to Wm. C. Langley, 2 00
The best six heads of Lettuce, Jas. Weir, 2 00

SPECIAL PREMIUMS.

For specimen of Stove Plant, Geo. Thompson, 1 00
For collection of Stove and Green-house Plants, J. E. Rauch, 5 00
For seedling Mimulus, Poynter & Canner, 1 00
For specimen of Green-house Plant, W. & J. Park, 2 00
For collection of Large Plants, Geo. Sutcliffe, 3 00
Specimen of Grapes, white and black, Roswell N. Colt, Patterson, N. J.

BUCHANAN ON GRAPE CULTURE, &c.

We see this excellent little work has passed to its fifth edition. It treats of vineyards, the position, soil, planting, pruning, diseases, varieties of grapes, &c. Then directions for wine making, including a compendium of statistics of the business, cost of vineyards, wine, the profits, &c.

It contains within a small compass, much useful information on this whole subject, and is adapted to be particularly useful to the amateur as well as the market cultivator and wine maker.

The present interest on this whole subject, must continue the large demand for the work. It is published by Messrs. Moore, Anderson & Co., of Cincinnati.

TALL SUGAR CANE.—Sugar cane, of the red ribbon variety, measuring nine feet in length, has been raised this season on the plantation of Major Robert Gamble, on Manatee river, Florida. One of these canes contained thirty-five joints.

NEW-ENGLAND SPRING FLOWERS.

PUTNAM'S MAGAZINE FOR MAY is, as usual, filled with good things. Besides the editorial notes, it contains some fifteen well-written articles. Our attention was particularly attracted to one of these, entitled "New-England Spring Flowers," which gives an interesting description of several wild flowering trees and plants. We present the following extracts as a specimen.

One of the first intimations of vernal life to the city folks, comes in the welcome form of the MAY FLOWER. They are sent as choice presents from country friends, and they are sold in considerable quantities in the stores. Fathers carry home a sprig of the first growth of spring to their children, and the sweetest gift of the season from the lover to his mistress is a nosegay of their delicate, fragrant blossoms.* Many other flowers of superior beauty and richer fragrance may be found among the countless forms of the ripe season, but none are more prized than this humble little plant; for it comes when there are no others to vie with its sweetness, when we are longing for the bright summer. Who does not welcome the lovely courier that she sends before her!

It belongs to the Natural Order ERICACEÆ.

There is a large and strongly-marked family of plants, blossoming very early in the year, with whose peculiar mode of inflorescence few beside botanists are familiar. They who are tempted forth into the woods by the young April sun, may very likely notice the long, worm-like tassels which hang from the bare branches of certain bushes and trees. Some are yellow, some brown, and some green, and they hang drooping from the trees, swaying in the wind that sweeps through their leafless boughs. These are the amentaceous plants; thus named because the tassels are termed aments by botanists. They comprise a large portion of the forests over the whole northern country. The alders, birches, bayberries, hornbeams, poplars, willows, hazels and oaks are all members of this extensive race. Some few are low and bushy, but the greater number is composed of fine, large, graceful trees.

Before the leaves are expanded, and, in some instances, before they have even thrown off the shelly covering which has protected them through the winter, these tassels, formed during the preceding summer and remaining through the winter, begin to elongate rapidly. The male or sterile flowers are very similar throughout them all. They are composed of a central stem upon which are arranged, generally in an imbricated manner, a great number of little scales. These are either entirely naked, as in the alder, or covered with long, silken hairs, as in the willow. At first, the aments are rigid and inflexible; but a week of warm weather will cause them to lengthen. Then may be seen, peeping from under each scale, a cluster of stamens, springing often from second thinner scales, and protected from the cold by the stout shield of the outer one. When thus expanded, the ament is loose and flexible, obeying the slightest impulse of the wind. At this time the anthers give out their pollen and some species present a most beautiful appearance.

Although the different genera differ widely in their female or fertile aments, the sterile ones so closely resemble each other as to be easily confounded by an unpractised eye. The alders, birches, hazels and hornbeams are thus closely allied. But the fertile flowers and the fruit are wholly unlike, and as on account of these differences they are placed in distinct orders, we will

briefly recount the peculiarities of each. An extended notice of their minute botanical differences will be quite needless here, as these differences are such as will interest the professed botanical student alone. Their varied uses might furnish a subject for volumes. Those who desire a close acquaintance with this vast race of stately plants, will obtain the best of assistance from Emerson's Report, previously mentioned, and the "North American Sylva" of Michaux.

The alders and the birches are put together in one order, called BETULACEÆ. The principal difference between them is that the birches lose their catkins entirely at the end of the season, while the alders continue to bear them through the winter.

One of the earliest and prettiest of the vernal flowers is the MAY WEED or EARLY SAXIFRAGE (*Saxifrage Virginiana*, Mx). As soon as the snow melts from the low hill-tops, and the frost has set free the thin soil beneath, it begins to show signs of activity. Close to the ground, in the midst of the starved grass, its little rosettes of downy leaves are found in great abundance. They are an inch long, of an oval form, cut into rounded teeth above, and tapering at the base into broad stalks half as long as the blade. In the center of this little circle lie the clustering flower buds, insignificant at first, but soon rising from their leafy bed. They are borne upon the summit of a naked pubescent stalk, which grows with great rapidity to a height of from six to twelve inches. This stalk gives forth branches as it rises, each one accompanied by a narrow, thread-like downy leaf, until the plant takes a paniculate form, sometimes thin and loose, and oftener close and crowded. The flowers are small but pretty, arranged in clusters on the ends of the branches. The calyx is cut into five oval lobes, which are sometimes tinged with purple, and stand somewhat erect. The white, oblong, spreading petals are twice the length of the calyx lobes, and alternate with them. The stamens are ten in number, and the two styles ripen into a pair of diverging pods, united at the base, inclosing many seeds.

This species with one other later (*Pennsylvanica*) are our only eastern representatives of a vast genus, many species of which belong to the north and north-western part of this continent, and which is extensively diffused over Europe. The delicate blossoms of many small species adorn the mountain-tops with their simple elegance as high up as vegetation is found. Mr. Oaks found one small species, the *S. rivularis*, on the top of Mt. Washington; but it is very rare. Others are cultivated in our gardens for their beauty. They belong to and typify the order SAXIFRAGACEÆ.

The summer rambles of our city children begin with the flowering of the MAY WEED, and groups of sturdy little fellows, to whom the riches of green-houses and gardens are denied, may be seen returning from their holiday strolls with handfuls of its drooping blossoms.

Another of the equally common and beautiful flowers is the WIND FLOWER or WOOD ANEMONE (*Anemone nemorosa*, L.). It grows in profusion by the roadsides and in the open woods, spangling the ground with its pure starry blossoms in early spring. No one is better known or better beloved by the young botanists who go "a Maying;" and should "winter, lingering, chill the lap of May," it is not sure to be found at that season.

The underground stem is long and worm-like, giving forth scattered rootlets, and sending upwards from its apex a smooth, slender stem, four or five inches long. From its summit spring forth, in a circle, three or five compound leaves which diverge horizontally and equally around the stem. They are on stalks nearly half an inch long, and are composed of three smooth, wedge-shaped leaflets, which are cut into large teeth, and are sometimes three-lobed at the apex. From the center of these leaves rises a single flower on a naked downy peduncle, more than an inch long. The bud droops gracefully before opening, but gradually rises in

bloom, expanding its snow-white leaves, from four to eight in number, in a star-like form. These leaves or sepals, for the flower is only a petaloid calyx, are of an ovate form, delicately veined, and frequently of a purple color on the exterior, which makes the young bud extremely pretty. The stamens are numerous, surrounding a cluster of fifteen or twenty pistils. The seed-vessels are of an oblong form, tipped with a hooked beak.

There is a delicacy and a purity in this little flower, which commends it to the affections of every body. Its common occurrence has never purchased for it that contempt which is often given to natural beauties that have become familiar. Its simplicity and unobtrusiveness make friends of every one. It derives its name, both scientific and popular, from an ancient and idle notion that it only blossoms while the wind is blowing. It belongs to the order RENUNCULACEÆ, and to a large genus of plants which has given to florists some of the choicest ornaments of their gardens. Many of the foreign species are richly colored. Later in the year, three other native species flower with us: the *Cylindrica*, *Virginiana*, and *Pennsylvanica*. The last is found only towards the West. These are all less beautiful than the one we have described, and much larger.

The first tree which unfolds a perfect blossom is the RED MAPLE, or as it is sometimes called in different localities the SWAMP, WHITE, AND SCARLET MAPLE (*Acer rubrum*, L.). It is one of the most common trees in the country, ornamenting the swamps and low woods at all seasons of the year. The scaly buds, which stud the branches in profusion, swell with the first warmth of spring. A few days of uninterrupted mildness in April will cause them to expand. Each bud discloses four or five small red flowers which spring on short pedicels from the same point. The calyx and corolla are similarly colored, though the petals are of a more delicate texture. The number of divisions is not always the same, ranging from four to six. The stamens are equal in number to the calyx lobes, and stand before them. They are two or three times as long as the flower, giving a bristly appearance to the clusters. The flowers are not all perfect, in fact not commonly so. Some have stamens only, some pistils only, and seldom both. Some trees bear only the staminate, some the pistillate flowers, and others both of them. They are termed polygamous in botanical language. The fertile flowers have two long downy styles which curve outwards. When the stamens are present also, they are shorter than in sterile flowers.

Both kinds of flowers are of a beautiful scarlet hue, and as they spring in great numbers around the bare branches, they give to the whole tree a brilliant coloring. None of the forest trees present so fine a view as the red maple at this period. It blooms long before any verdure has appeared, and rears its flaming head over the sleeping life around, so bright and beautiful as to distinguish it at a great distance. But not in bloom only is it remarkable for its elegance. When the flowers have fallen away, the peduncles begin to elongate rapidly, bearing on their apex the swelling germs, crowned with the outcurving stigmas. At first they are of an inverted triangular form; but as they grow larger two wings are developed at the outer angles which grow very rapidly, diverging as they increase, until they attain a curved, spatulate form, thickened at the outer edge, which gives rise to forking veins that curve inwards. They bear considerable resemblance to the wings of some insects. At this time the tree presents again a most beautiful appearance. The keys or samaras, as they are termed, hang pendent on peduncles which grow from an inch and a half to two inches, clothing the tree with a rich crimson tasseling, even more ornamental than its early bloom. The seed vessels themselves are small and compressed, growing in pairs, and bearing the wings on their outer edge. They contain one seed each.

(To be continued.)

* Emerson refers very pleasantly to its name, in his admirable work on the Woody Plants of Massachusetts. He says: "Often from beneath the edge of a snow-bank, are seen rising the fragrant, pearly, white or rose colored, crowded flowers of this earliest harbinger of spring. It abounds in the edges of woods about Plymouth, as elsewhere, and must have been the first flower to salute the storm-beaten crew of the May-flower, on the conclusion of their first terrible winter. Their descendants have thence piously derived its name, although its bloom is often passed before the coming in of the month of May."

American Agriculturist.

New-York, Wednesday, May 17, 1854.

BOUND VOLUMES.—We have a few sets (26 numbers) of volume eleventh, bound and unbound. The price, at the office, of the unbound volumes is \$1.00. The bound volumes are neatly put up in cloth covers, gilt backs, at \$1.50.

We can also furnish the covers separately, gilt and all ready for putting in the paper, for twenty-five cents each. With the covers thus prepared, any bookbinder can complete the binding for twenty-five cents. Volumes sent to the office will be bound complete for fifty cents.

We are having printed a new edition of the first ten annual volumes of the monthly *Agriculturist*, which can be supplied for \$1.25 per volume or \$10 for the set of ten volumes.

BACK NUMBERS.—We have taken the precaution to print each week a large number of extra copies, so that we can still supply new subscribers with full sets from the beginning of this volume, (March 15.) Any copies accidentally lost by a subscriber, will be freely supplied. Specimen copies sent to any person, whose address is furnished post-paid.

INTERESTING FACTS ABOUT CANDLES, LAMPS, &c.

We could heartily wish that man would act more like other animals in regard to his hours of labor and rest; like them, work and pursue pleasure while the sun shines, and sleep while the sun sleeps. How much more healthful it would be, not only for the whole body, but especially for the eyes, and *how much expense it would save*. It costs the world more now for artificial light to make up at night for the cheap sun-light lost in the day-time, than it does to supply all the intellectual light of the schools. In other words, if every body would use all the sun-light given to them, and no more candle or gas light than would then be necessary or healthful, the money so saved would support more teachers and schools than we now have. Which get the most money in this city, the gas companies, the burning-fluid men, the camphene men, and the tallow chandlers, or the teachers?

However, we did not sit down to moralize, but to talk about *how* light is produced. See that burning piece of coal. What makes it shine so? Why it is nothing more nor less than a coating of heated, glittering diamonds. And the brilliant gas-light, the duller flame of the oil lamp, or the wax or tallow candle, and the cheerful blaze of the wood fire, are in like manner produced by masses of heated diamonds. Let us see how this is.

Chemistry tells us—and proves the truth of what it says—that charcoal, or carbon, and the diamond, is one and the same thing. In the diamond the little particles of carbon or coal are packed together in such a manner as to present a beautiful crystal. In the coal these little particles are loosely put together, so as to absorb all the light, instead of reflecting back to the eye the shining rays, as does the smooth surface of the diamond. A piece of coal and a diamond, when subjected to a strong heat, both

burn, and glow alike, and both produce that suffocating gas which we perceive when a furnace of coal is burning in a close room. If we heat either the coal or diamond in a close vessel, where no air can get access, they will shine on for years without growing less in bulk.

Let us study another phenomena before we can understand fully how gas light is produced. There are two gasses—invisible substances like air—called oxygen and hydrogen. These are made up of little particles so small that we cannot see them. If we take one quart of the oxygen gas and two quarts of the hydrogen gas and mingle them together, and apply a lighted match to the mixture, the little particles will instantly unite together in pairs, one particle of oxygen with one particle of hydrogen, and form little double particles of water. These little particles of water thus produced will run together, and from our three quarts of the mixed gases, we shall have a few drops of water, perhaps a quarter of a teaspoonful. For a reason, which we cannot now stop to explain, these two gases in uniting together to form water, give out a great quantity of heat, which they before contained, but which was kept in such a hidden state that we could not perceive or feel it. Now, if before lighting these mixed gases, we had scattered all through them a little cloud of the finest charcoal or diamond dust, the heat given out by burning the two gases, would have made these little particles red hot, and we should have had a brilliant flame for the instant; that is, the cloud of diamond or charcoal dust would have become glowing hot, and resembled the burning gas flame. In this case we see that three substances, or three kinds of particles, carbon, (coal or diamond,) oxygen, and hydrogen, are present to make the light; the oxygen and hydrogen to produce heat, and the carbon to become heated, and produce the shining or light. It is the presence of these three substances in a gaseous (air-like) or vapor form, that produces the bright flame of the gas light, or of the lamp or candle, and thus we see how it is that our lights are masses of glittering diamonds.

Let us now see how these particles of carbon, oxygen, and hydrogen, are furnished to keep up the flame. The substances usually burned to produce light are, wood, oil, tallow, lard, turpentine, camphene, which is refined oil of turpentine, burning-fluid, which is camphene dissolved in alcohol, rosin, tar, and bituminous coal. These are almost entirely made up of carbon, (coal or diamond,) hydrogen, and oxygen. There is generally, however, very little oxygen in these, and in some of them when pure, none at all.

If we drop a piece of tallow on the outside of a red hot stove, there will immediately rise up a dense mass of white smoke. If we apply a lighted match to this smoke it will take fire and produce a brilliant light. If we take a tin funnel, and with a cork, fit a pipe stem into the small end, and then place the funnel closely over the smoking tallow upon the stove, the smoke or gas will rise up through the pipe stem, and we can then light it, and thus have a little gas apparatus, and burn the same kind of gas that is made at our city gas works. Any of the substances mentioned above, such as oil, turpentine, rosin, &c., will produce precisely the same effect. When the substance is heated by the

hot stove a change takes place among the particles. What little oxygen there is unites with some of the hydrogen, and rises up in the form of watery vapor, and gives the white color to the smoke. The rest of the hydrogen unites with the carbon in little groups, 4 atoms of the carbon uniting with 4 atoms of hydrogen, forming a substance called by chemists olefiant gas, which is precisely the same thing as our city gas. This gas, then, is a kind of double vapor of hydrogen and carbon, (coal or diamond;) and it is invisible, that is, it cannot be seen. Upon the stove we can only see the watery vapor that rises with it. The air, into which this gas escapes through the pipe stem, contains a large amount of oxygen, and as soon as we light this gas in the air, the oxygen unites with the hydrogen contained in the gas and forms water, which is dissipated in the form of vapor. Hold a cold glass a little above a gas or lamp light for a moment, and it will become covered with this water, condensed upon its surface. As before explained, this union of oxygen and hydrogen to form water, produces heat enough to make the particles of the cloud of carbon red hot, and this gives us the light. The little diamonds, or particles of coal, are soon carried away in another form, having united with more oxygen to form another gas, but new particles are continually rising up with more hydrogen, and thus a steady flame is kept up.

Now let us apply our stove experiment to the explanation of our city gas works. In these they take large iron tubes, and put into them rosin, tar, oil, tallow, wax, a kind of bituminous coal which contains tar, or even wood, and they then close up both ends of the large tube, and build a fire under it till it is red hot. This heat acts upon the enclosed substances, just like the red hot stove, and changes them to vapor or gas. On one side of this large tube is a smaller iron tube, which carries away the gas as fast as it is formed, and conveys it into a chamber where it passes through water, and afterwards into another chamber where it comes in contact with lime. The water and lime wash out and take away from it all impurities, and the pure gas, composed of the united vapor of hydrogen and carbon, (coal or diamond,) then goes into a large gas reservoir, from which it is conveyed in pipes over the city, and is let out in little jets to the air, from which it gets the third needed substance, oxygen, and produces light.

But precisely the same thing is going on in a candle or lamp. Here the hot wick of the candle or lamp takes the place of the hot stove, or of the hot tubes in the gas works. The heat of the wick changes the tallow, or oil, or camphene, &c., into the same kind of gas as is produced in the gas works, and it rises from the wick just as it rises from the gas jet, and burns in the same way in the air. The only difference is, that we get from the gas pipe a larger amount of gas, made on a larger scale, and from cheaper materials.

We cannot leave this subject without stating further, that wood and tallow are made of the same elements, and that the flaming from wood is also the burning of the same gas as in the candle. A very pretty experiment will illustrate this. Take a pistol or gun barrel, and put into it a few small pieces of dry wood, and then close up the open end with some wet clay, and lay the other end upon some hot coals. As

soon as the barrel becomes red hot the wood will change to gas, which will escape in a jet through the priming hole, and taking fire will form a beautiful gas flame, which will last till all the wood in the tube is consumed. Experiments are now being made to produce all gas for light from wood alone, and we have good reason to expect that candles, lamps, and the dangerous burning fluids, will soon give place to a more beautiful gas light produced entirely from wood.

How simple and yet how interesting and wonderful are the changes that are constantly going on around us. Who would think without looking into the matter, that in our candle or lamp, the wick is a retort producing a beautiful gas, and that the brilliant flame is caused by heated diamonds or particles of coal, made hot by two other simple air-like substances uniting and forming watery vapor. Yet this is entirely true, and it would be still more interesting to trace one of the gases formed by the disappearance of these diamond particles, as it goes off from the candle flame in an invisible state into the air, is again absorbed by the leaves of plants, and forms part of their substance; these plants are then eaten by animals, and by them again transformed into tallow for a new candle.

THE PIE PLANT.

How seldom do we see this plant growing in the farmer's garden; and yet it is one of the most delicious of fruits—if we may so call it. It is no more difficult to cultivate than potatoes or corn. It is usually fit to eat by the last of April in an early spring, and it may be kept growing and in use nearly all the summer. With no particular attention to ours this season, we cut it on the 6th of May; and had we taken the pains to manure it last fall, cover it during the winter with litter, and top-dress it early in March, late as this spring has been, we think we should have had it ready to cut two weeks earlier.

Stewed in water, with a little sugar added, it is much superior to gooseberries, and to our taste, comes next to strawberries. For pies it is more delicious than apples. Its sub-acid on a warm spring day, is no less healthful than agreeable. The great merit, however, of this vegetable or fruit is, that it comes when no other is in season, save the longest keeping and highest priced winter apples.

MASTICH FOR OUTSIDE OF BUILDINGS.—A subscriber asks for the best and latest improvements in the application of mastich as an outside coating for buildings. Will some of our correspondents furnish any information they have on this subject?

TENACITY OF LIFE IN A FOWL.

A CORRESPONDENT residing near Yonkers, Westchester County, communicates the following remarkable fact, which our readers may rely upon as correct. During a heavy snow storm in March last, he missed one of his hens, and after looking in vain for her, gave her up as lost. On the *thirty-fourth* day after the occurrence, his attention was attracted by a slight scratching noise inside a wooden spout which conducted the outer air to his furnace in the cellar, and upon taking off one of the boards he

found his hen inside—alive, but in so exhausted a state, that he was unable to restore her, although she lived for three days longer.

She was a fine black hen, a cross between a Shanghai and Poland, about two years old. During all these thirty-four days it was impossible she could have received any food or water, and there was a strong current of the coldest air constantly rushing past her.

Our correspondent regrets exceedingly, he cannot report her now alive, after such an effort to retain the vital principle. Has any one ever heard of such tenacity of life in a chicken?

STATE POULTRY SOCIETY.

ARRANGEMENTS FOR A FALL SHOW.

At a meeting of the Managers of this Society, held in Utica, on Friday last, it was decided that the next grand exhibition should be held at Utica, in November next. Messrs. RICHARD U. SHERMAN, of Utica; A. A. HUDSON, of Syracuse; RICHARD C. McCORMICK, Jr., of Long Island; FRANCIS ROTCH, of Morris, Otsego Co., and D. S. HOFFMAN, of Utica, were appointed a committee to make all necessary arrangements, and instructed to have the premium list and regulations printed and ready for circulation on or before the 1st of August ensuing. We trust that the people of Utica and vicinity will give the Society as hearty a reception at its second exhibition, as it received from the Albanians on the occasion of its initial show, held in February last.

Utica is a central and easily accessible location, and the month chosen is in some respects superior to any other in the year, for the purposes of a fowl gathering.

ACKNOWLEDGMENTS.—By the courtesy of Mr. EDWARD ABORN, of Providence, we have received four volumes of the "TRANSACTIONS OF THE RHODE ISLAND SOCIETY FOR THE ENCOURAGEMENT OF DOMESTIC INDUSTRY."

We are also indebted to Mr. C. L. FLINT, Sec. of Mass. Board of Agriculture, for a copy of "THE AGRICULTURE OF MASSACHUSETTS AS SHOWN IN RETURNS OF VARIOUS AGRICULTURAL SOCIETIES."

We have not now time or space for further notice of the above valuable documents.

UNITED STATES MAGAZINE.—The first number of this new candidate for public favor is received from the publishers, Messrs. A. JONES & Co., at No. 1 Spruce street. This number contains 32 large pages of substantial and instructive matter, and in this respect differs from the usual magazine literature of the day. The editor's intentions and views may be gathered from the following extract from his salutatory:

We have lived long enough to feel that the journey of life has its end, to be reached in a few and rapid stages at the longest; and that the most interesting and pertinent question any one can ask himself is, "what good can I do while I stay here?" Thus impressed, it will be our endeavor to give to the *United States Magazine* a useful, practical, instructive character, rather than light, imaginative, and sentimental. But though the face of our magazine may be grave, we do not mean it shall be austere, but hope and trust it may ever wear a smile that shall make it attractive to many and repulsive to none.

* * * * *

Now then, let us go ahead without any cere-

mony, and spread our humble board. We do not promise, like the hotel-keepers, that it shall be covered with "all the delicacies of the season;" but we hope it may present an abundance of wholesome, substantial, farm-like fare, upon which any one who hungers for mental nourishment may make a comfortable meal. If he finds not abundance of honey, he may now and then perhaps get a taste of mustard; and though he may miss the soft custards and sweetmeats of magazine literature, we trust he will generally find a good cut of roast beef within his reach, and occasionally a plum-pudding; and in default of asparagus in its season, he may at all times rely upon us for a dish of *greens*.

Now, reader, fall to, and help yourself to what you like best.

THE GREAT ECLIPSE ON THE 26TH.

We intended to have written out a plain description of this great eclipse of the sun for the boy's column of this week; but not having time for this, and as our next paper will not reach distant subscribers before that event, we copy the following short account from the *Evening Post*, with the single remark, that before the recurrence of another such eclipse our present boys will be grown up men, and we shall begin to be numbered among the aged.

On the 26th inst. there will be an eclipse of the sun, which will deserve to be remembered here as one of the most remarkable of this century.

Because the moon happens at this time of the month to appear smaller than the sun, it will nowhere cover the sun, but in the most favorable positions a narrow ring of light will be seen.

The places where this ring can be seen are in a tract from 110 to 130 miles in breadth, the middle of which passes through Portsmouth, N. H., coming from the northwest across the southern part of New-Hampshire, the middle part of Vermont, the northern part of this State and West Canada. In the middle of this tract the ring will be perfect and about a thirtieth part of the sun's diameter in breadth.

Both the beginning and the end of eclipse will be visible throughout the whole of the United States, and observations of them will be of great use for the determination of longitudes.

The shadow of the moon coming across the Pacific first reaches the coast of California, near San Francisco, at about half past two in the afternoon, by Washington time, or at about half-past eleven in the morning, by the time of San Francisco; and in two hours will have covered nearly the whole continent of North America, with its southern limit in the southern part of Mexico, and its northern limit beyond the northern pole.

It will continue on the whole of the United States nearly an hour and a half, when, first ending on the Pacific coast, it will pass from the whole country in less than fifty minutes.

The eclipse will begin in this city about sixteen minutes past four in the afternoon, and end about thirty-eight minutes past six; the moon will cover from ten to eleven-twelfths of the sun's diameter.

The effect of an annular eclipse on the earth and sky is less striking than that of total eclipses, which are described by those who have seen them as presenting an awful aspect during the short time that total darkness lasts. The advance of the total shadow around the horizon can be seen from an eminence, and as it comes on it plunges the regions in its path into appalling darkness, while a gloom hangs over the rest of the country.

But the appearances of the earth and the sky during an annular eclipse, though worthy of more notice than is often given, are not the principal features, unless the day be cloudy. The formation of the ring will be, where it can be seen, the great attraction of the occasion, and will, probably, injure the eyes of many admirers.

Opticians say that their business is never more flourishing than after a solar eclipse.

It appears, in a short notice of this eclipse by the *Boston Journal*, that it will be seen in the morning, and the editor recommends early rising to his readers.

This mistake, probably, arose from confounding astronomical time, which is reckoned from noon alone, with civil time, which is reckoned from both noon and midnight—thus 4 o'clock means in astronomy 4 P. M., and 4 A. M., is called 16 o'clock.

It is, probably, not unknown to many of our readers, that in a period of about eighteen years, called the Chaldean period, or the lunar cycle, eclipses go through an order of performances, which are repeated, with but slight variations, again and again; but that in the course of time these variations amount to great changes, so that from time to time some old eclipse will be dropped out, and some new one taken up in the eighteen year programme. This subject is finely discussed in Ferguson's astronomy, and a history of the returns of the coming eclipse is given as an example.

The approaching eclipse first appeared on the list about the fifteenth century, and will continue to return till about a thousand years after its first appearance, when, having gradually passed off the earth, the shadow, at the corresponding returns of new moon, will continue for more than ten thousand years to sweep by the earth without touching it, and then will again return to entertain or terrify, perhaps, a new race of men.

Scrap-Book.

For the American Agriculturist.

WHAT IS THE PARTICULAR SORROW OF A SAD IRON?

"WHAT is the particular sorrow of a sad iron?" the *Agriculturist* asks. Why, indeed, does it receive this gloomy prefix? Its face is bright and smooth, all unwrinkled by sorrow, nor furrowed by care. Is it because of the sad spirit which sometimes, nay often, shoves it over the rough linen? Is it because the busy housewife sighs as she looks at her week's ironing, which must be done, if baby does cry unattended in his cradle? Is it because of the breaking hearts and worn bodies of those who earn their daily bread rubbing and wringing, sprinkling and folding, starching and smoothing?

How many a tale of killing toil could these sad irons tell. The tears of the poor sufferer have "sissed" on their hot surface,—the tears too of children have fallen on them, as they have been sped on their mission to procure bread for the starving.

Why are they called sad? Could not many a housekeeper answer this question with some conjecture of her own? See that table piled with clothes. Look at that care-worn woman, pale and tremulous perhaps, or purple, it may be, with the coming "chill." No wonder she looks with a tearful eye, and aching heart, at the polished irons arranged on the mantle. No wonder she gives them a name which reflects the state of her own feelings.

It is because these irons are associated with life-consuming toil—with over-tasked and exhausted strength—with much that makes the duties of domestic life a weariness, even to the loving, that they receive their peculiarly "sad" and melancholy name.

It will not be many years, I hope, before some "cunning man endowed with understand-

ing," shall invent a machine, which shall lighten the cares of ironing-day, and banish sad irons for ever from our sight.

ANNE HOPE.

DEAL GENTLY WITH MY MOTHER, WORLD.

BY HENRY CLAY PREUSS.

DEAL gently with my mother, world!
Her days are in the yellow leaf,
And time with her is growing brief;
She is not now what she hath been,
Her eye hath lost its glowing sheen:
The rose is faded from her cheek,
And life's dark stream grows faint and weak;
The forms which walked with her of yore,
Come back again, oh, nevermore—
Deal gently with my mother, world.

I was not favored by thee, world!
Oh, life was dark, e'en from my birth,
And I have tired long of earth;
But now I know mine hour has come,
I feel the death damps on my brow,
But, world, I do not blame thee now;
Though thou hast been unkind to me,
I cast no harsh reproach on thee;
My boyish dreams have passed away,
But with my dying breath I pray,
Deal gently with my mother, world!

Spare her in your sorrows, world!
I was her favorite, darling boy—
Her earthly hope, her spirit's joy,
God only knows I loved her well—
How much, no language now can tell;
But I am fallen in my prime,
As leaves in early summer time,
And when my soul shall leave its clay,
Her last fond hope shall pass away—
Then in my deep despondency,
This dying boon I crave of thee—
Deal gently with my mother, world.

A YANKEE GETTING MARRIED.

CHANCING to visit the office of Alderman _____, the other day, we witnessed an hymnical ceremony that will bear narrating.

The bridegroom was a weather-beaten countryman, a perfect picture of good nature, but so tall that in entering the portals of the office an involuntary obeisance was necessary; while the artificial hollyhocks on the summit of the bride's bonnet just touched the elbow of her expected lord. Their entrance was preceded by an urchin with dilapidated garments, who claimed and received three coppers as his fee for guiding them to the spot.

"What can I do for you, my good friends?" asked the urbane alderman, as if in utter ignorance of the object of their visit. "Pray be seated, madam."

"Well, squire," answered the groom, with a complacent glance at the flagree breast-pin that fastened a dashing ribbon around the lady's neck; "old Mrs. Pettibone down to Lynn—you've hear'n tell about her I reckon?"

"Well, really, I think—I hardly know—I guess not."

"Not heard tell of her, 'squire! why she makes about the best punkin sass you ever put in yewr stummik, I reckon; slips down jist as sleek as a greased cat crawlin' through a jint of stove-pipe."

"Very happy to be introduced to her, sir; but don't let me interrupt you. Pray proceed."

"Jes' so, jes' so. Well, old Mrs. Pettibone gin' me Dianthy, here, to get spliced to; she's a widdier woman, and old deacon Pettibone made ropes of money in the shoe-peg business when he was alive, and I larnt the business with him; so yew diskiver that nat'rally I liked the

gall, and the old lady gin consent; so, ef yew'll pronounce the ceremony, your money's ready."

"So you wish to be married, eh?" queried the alderman, willing to spend a few moments' leisure in conversation; may I venture to ask what induced you to break through a bachelor's life?"

"Sartin, squire; sartin. Yew see its nat'ral. Who ever hearn tell of a bachelor chippin' bird or a bachelor bob-o-link? I reckon nobody has. And then ain't *doublin'* kinder nat'ral? Ain't double roses and double mornin'-glories, and double pinyes the poostyist, and don't every body like 'em better than single ones. The amount on it is, nature teaches it, squire, clear through the programmy, beginning with the robins and leaving off with the apple blossoms."

"Very true, my good sir; a very philosophical view of the object. (Turning to the lady.) And you, madam have you given this subject the attention it merits?"

"Never mind her, squire, jest let me settle that air business; 'tain't no kinder use to trouble yourself about Dianthy. Jest you fetch out yeur books and fire away."

The ceremony was soon performed. Our "Reform" alderman has carried improvement even into that department of his duties—and a two dollar bill was duly placed in his palm by the newly-made husband. After he had congratulated the pair and wished them success, Jonathan exclaimed:

"Squire, you're a reg'lar trump, you are; and if you ever come to Lynn, you'll find a stoppin' place with me, and a rousing welcome. But, squire;" and Jonathan facetiously inserted his forefinger in the region of the Alderman's ribs, "I'm done with *one-horse bedsteads*; I am. Good-bye, squire!"—*Journal of Commerce.*

YOU WILL BE WANTED.

TAKE courage, my lad. What if you are but an humble, obscure apprentice—a poor, neglected orphan—a scoff and bye-word to the thoughtless and gay, who despise virtue in rags because of its tatters. Have you an intelligent mind, all untutored though it be? Have you a virtuous aim, a pure desire, and an honest heart? Depend upon it, one of these days, *you will be wanted*. The time may be long deferred. You may grow to manhood, and you may even reach your prime, ere the call is made; but virtuous aims, pure desires, and honest hearts are too few and sacred not to be appreciated—not to be wanted. Your virtues shall not always wrap you about as with a mantle—obscurity shall not always veil you from the multitude. Be chivalric in your combat with circumstances. Be ever active, however small may be your sphere of action. It will surely enlarge with every movement, and your influence will have continual increment.

"In the world's broad field of battle,
In the bivouac of life,
Be not like dumb driven cattle,
Be a hero in the strife."

Work on, for surely you will be wanted, and then comes your reward. Lean upon the sacred verity, "I have never seen the righteous forsaken or his seed begging bread." Never despair; for the lives of good men abundantly testify that often when clouds are blackest, and the tempest is fiercest, and hope is faintest, a "still small voice" will be heard, saying, "Come hither, you are wanted," and all your powers will find ample employment. Therefore, take heart, young men, for ere long you will be wanted.—*Our Drawer.*

HOPE is a bright and beautiful bird; it comes to us 'mid darkness, and sings the sweetest song when our spirits are saddest, and when the soul is weary and longs to pass away, it warbles its sunniest notes, and tightens again the slender fibres of our hearts, that grief has been tearing away.

ELEPHANT ON BOARD.—When the Elephant went up the lake on the steamer *Lady Elgin*, a few days since, we remarked that the huge traveler might be a somewhat ugly customer on board a boat. It appears that on the passage the wheelsman suddenly found difficulty in changing the boat's course. For, tug and pull, and bear on as much as he would, the wheel would not budge an inch.

"Port helm!" cried the Captain.

"Aye, aye, sir," responded the wheelsman.

But still the helm was "hard a starboard," and the boat was taking a turn into the middle of the lake. The Captain swore, and the mate made for the wheel-house. Pushing the man aside, he took hold himself. It was of no use—the mate was no more successful than the wheelsman.

"Port helm! for heaven's sake! Can't you see where the boat is going?" shouted out the Captain.

The mate declared that something was the matter with the wheel, as he could not stir it. The thing was perfectly inexplicable. The engine was stopped, and master, mate and all hands went below to see what could be the matter. After a search of some minutes, it was discovered that Mr. Siam, the "Elephant" of the Menagerie, not liking the noisy rattling of chains overhead, had taken upon himself the responsibility of giving a new "turn" to affairs. With his trunk wound around the chain he was holding on with the grasp of a vice, and it was with some difficulty that the keeper persuaded him that such liberties could not be allowed. It is said that he behaved quite well during the rest of the voyage.—*Buff. Com. Adv.*

WOMAN.—The following charming passage is from "Rural Hours," by Miss Cooper, daughter of the late Fennimore Cooper. It so beautifully expresses the sentiments of all women of pure feeling and correct principles, that it should be widely circulated:

"We American women certainly owe a debt of gratitude to our countrymen for their kindness and consideration of us generally. Gallantry may not always take a graceful form in this part of the world, and mere flattery may be worth as little here as elsewhere; but there is a glow of generous feeling toward women in the hearts of most American men, which is highly honorable to them as a nation and as individuals. In no country is the protection given to woman's helplessness more full and free—in no country is the assistance she receives from the stronger arm so general—and nowhere does her weakness meet with more forbearance and consideration. Under such circumstances, it must be woman's own fault if she be not thoroughly respected also. The position accorded to her is favorable; it remains for her to fill in a manner worthy her own sex, gratefully, kindly, and simply; with truth and modesty of heart and life; unwavering fidelity of feeling and principle, with patience, cheerfulness and sweetness of temper—no unfit return to those who smooth the daily path for her."

SICKNESS.—In sickness the soul begins to dress herself for immortality. First she unties the string of vanity that made her upper garment cleave to the world, and sit uneasy. She puts off the light and fantastic robe of lust and wanton appetite. Next to this, the soul by the help of sickness, knocks off the fetters of pride and vainer complacencies. Then she draws the curtains, and stops the light from coming in, and takes the picture down, those fantastic images of self-love, and gay remembrances of vain opinion and popular noises. Then the spirit stoops into sobrieties of humble thoughts and feels corruption chiding the forwardness of fancy, allaying the vapor of conceit and factious opinions. Next to these as the soul is still undressing, she takes off the roughness of her great and little angers and animosities, and receives the oil of mercies and smooth forgiveness,

fair interpretations and gentle answers, designs of reconciliation and Christian atonement in their places.—*Jeremy Taylor.*

PRICES THIRTY-SEVEN YEARS AGO.—Looking over our file for 1817, we cast our eyes upon the prices current of February of that year; and as an evidence that the present prices of many leading articles have not come up to that time, we give a few samples. The prices given, it must be recollected, are the wholesale; the retail were of course higher.

Bacon, 15 cents; barley, \$1 25 to \$1 50; beans, \$4 to \$4 50 per bushel; butter, shipping, No. 1, 24 cents, No. 2, 22 cents; corn, \$1 90 to \$2 10; coffee, 19 to 21 cents.

Virginia coal, from \$9 to \$15; flour, \$14 to \$15; hay \$21 to \$24; molasses, 48 to 54 cents; peas, \$2 50 to \$3; rice, 7 cents; rye, \$1 75 to \$3; sugar, loaf, 23 to 25 cents; brown, 11 to 15 cents; teas, hyson, \$1 70, hyson skin, \$1, sou-chong, 68 to 75 cents.—*Portsmouth Journal.*

THE HOME OF TASTE.—How easy it is to be neat!—to be clean! How easy it is to arrange the rooms with the most graceful propriety! How easy it is to invest our houses with the truest elegance! Elegance resides not with the upholsterer or the draper; it is not put up with the hangings and curtains; it is not in the mosaics, the carpeting, the rosewood, the mahogany, the candelabras, or the marble ornaments; it exists in the spirit presiding over the chambers of the dwelling. Contentment must always be most graceful; it sheds serenity over the scene of abode; it transforms a waste into a garden. The home lightened by these intimations of a nobler and brighter life, may be wanting in much which the discontented desire, but to its inhabitants it will be a place, far out-vying the oriental in brilliancy and glory.

SUCKERS DON'T BITE.—A witty clergyman had been lecturing one evening in a country village, on the subject of temperance, and as usual after the lecture, the pledge was passed around for signatures.

"Pass it along that way," said the lecturer, pointing towards a gang of bloated and red-nosed loafers near the door. "Pass it along—perhaps some of those gentlemen would like to join our cause."

"We don't bite at a bare hook," gruffly muttered one of the rummies.

"Well," replied the ready clergyman, "I believe there is a kind of fish call suckers, that do not bite."

A GOOD REPLY.—A Sabbath-school teacher instructing his class on that portion of the Lord's Prayer, "Thy will be done on earth as it is in heaven," said to them, "you have told me, my dear children, what is to be done, the will of God; and where it is to be done, on earth, and how it is to be done—as it is done in heaven. How do you think the angels and the happy spirits do the will of God in heaven, as they are to be our pattern?" The first child replied, "They do it immediately;" the second, "They do it diligently;" the third, "They do it always;" the fourth, "They do it with all their hearts;" the fifth, "They do it altogether."—Here a pause ensued, and no child appeared to have an answer; but after some time, a little girl arose, and said, "Why, sir, they do it *without asking any questions.*"

PLENTY OF FISH.—A French gentleman states that, at an expense of three or four thousand dollars, he could make the Susquehanna swarm from its source to its mouth with the best kinds of fish known in Europe or America. The time required would not be more than two or three years. The process consists simply in providing a few breeding places, where the destruction of the spawn would be prevented, and the young be fed for a few weeks.—*Exchange.*

LITTLE THORNS.—The sweetest, the most clinging affection is often shaken by the slightest breath of unkindness, as the delicate tendrils of the vine are agitated by the faintest airs that blow in summer. An unkind word from one beloved often draws the blood from many a heart which would defy the battle-axe of hatred or the keenest edge of vindictive satire. Nay, the shade, the gloom of the face familiar and dear, awakens grief and pain. These are the little thorns which, though men of rougher form may make their way through them without feeling much, extremely incommode persons of a more refined turn in their journey through life, and make their traveling irksome and unpleasant.

WANTED POLISHING.—A lad from the "Green Isle," whose occupation was that of blacking stoves, fire places, and stove-pipes, bearing upon his arms a pot of blacking, with brushes and other implements of his trade, addressed a denizen of the city who was standing at his door:

"Has your honor any stoves to polish this morning? I'm the boy for that business."

The person addressed not being of a courteous manner, gruffly answered,

"Go about your business."

Pat moved a few steps off, to be out of the reach of a kick, and replied.

"Your honor would not be the worse of a little polishing yourself, I'm thinking."

ANOTHER NEBRASKA BILL.—The Portland *Argus* states that a democratic young gentleman of this city, having lately been presented by his handsome wife with an eight pound boy, had him forthwith named "*William Nebraska*."

To which the Boston *Times* adds: "We wish all success to this little 'Nebraska Bill,' and hope that when he gets fairly launched into the great 'Committee of the Whole,' he will come out safe and bright. We may live to see him governor of Nebraska yet—who knows?"

PRACTICAL RHETORIC.—Our readers are probably aware that *alliteration* signifies that several words in a sentence begin with the same sound. It is a figure that sometimes adds great beauty to a phrase. But it may like other good things, be abused.

Here is an example from the floating literature of the day:—A phriend pheeling phunnily phigurative, phurnishes the phollowing:

"4ty 4tunate 4esters 4tuitously 4tifying 4lorn 4tresses 4cibly 4bade 4midable 4eigners 4ming 4aging 4ccs."

THE FRUIT.—The *Terre Haute Express* says that a gentleman of that place, who pays a great deal of attention to horticultural matters, thinks that there never was a better prospect for a fine crop of peaches than now.

In my neighborhood of Russellville, Kentucky, the peaches are very abundant and the strawberries remarkably fine.

NEW THIEF TRAP.—A singular expedient was adopted a short time since in Camden for catching a thief. The house having been entered several times, a bottle of drugged brandy was placed where it could not fail to be seen, and the ingenious plan resulted in the apprehension of a colored man, who had partaken of the brandy, and was found asleep in the room.

GOOD LIQUOR.—The Columbus (*O.*) *Democrat* says that strychnine is used in the manufacture of whiskey, to increase the yield of the juice of corn. An analysis of pure Cognac brandy, at Washington, is said to have shown the presence of nux vomica in that liquor.

WHAT IS "MEAN TIME?" That which allows only twenty minutes to dinner.

PRICE OF WOOL.

We clip the following items from exchanges, to show what others think on this subject. We have hardly formed an opinion as yet, though the present dullness of the New-York wool market, and some other considerations lead us to think the prices of this article will not rule very high the present season. The *Pittsburgh Gazette* says:

The season for sheep-shearing is now near at hand, and speculations are already indulged in as to the probable prices of the incoming clip. We are not prepared to give any precise quotations at which the market is likely to open; but we are enabled to assure our readers that prices will rule considerably—very considerably—lower than last year.

At this time in 1853 a very large amount of the wool clip was engaged on the sheep's back—speculators having bought it up thus in advance; this year but a little of this, if any, has been done. The whole clip will therefore now come upon the market. Last year the supply of the previous season was exhausted, and manufacturers eager buyers from the start; this year there is considerable stock over—enough to last manufacturers until the new clip seeks purchasers. The present clip, moreover, is much larger than any that has preceded it, the high prices prevailing last year having induced farmers to save all the sheep they could. All these facts tend to a depression of prices.

In addition to this, there has been since last year a material decline in the price of woolen fabrics, an accumulated stock of goods on hand, a decline of about 20 per cent. in England, and still tending downward, a heavy import of woolen manufactures, and a constantly increasing use of cotton along with wool, by manufacturers. Besides all this, it is generally thought that the first effects of the war in Europe will be to precipitate large quantities of European woolen fabrics on the American markets, and if this should be the case, this, of itself, must be sufficient to have as depressing an effect on the value of the present clip as all other causes combined.

The prices now prevailing in the eastern markets are from 10 to 12 cents a pound less than this time last season, and quotations still look downward. Money also is scarce, and buyers, it may be presumed, will not take hold except at prices that will be perfectly safe, on a downward market, with a probability of European revulsion, and money worth from one to two per cent. a month.

WAR AND WOOL.—Under this head the *Detroit Democrat* speculates as follows upon the effect of the European war on the price of wool:

Those who have bought sheep since the last shearing, have had to pay round prices for them; and there is good reason to doubt the wool market this summer. The war in Europe will prevent any foreign demand for the staple or its manufactures; and not only this (which is of little importance perhaps) but it is said to be deluging our markets with English, French and German woolen goods. The instability which war engenders, leads all men of property to investments—the removal of their means beyond the border of its probable ravages. This feeling is sending vast quantities of goods from the continent of Europe to peaceful America.

One dealer in this city has received from a relative in Germany (we are informed) the large amount of two hundred thousand dollars worth of woolen goods. One of our heaviest dealers tells us that the stock of this class of goods now in the hands of wholesale dealers is very great. He thinks with the additions which will be made this summer, there will be a supply sufficient for the next five or six years.

These circumstances may not affect the price of wool and woolens; but we confess that,

taken in connection with the growing stringency of the money market, it does appear to us probable that wool will be lower for a year or two than it has been for the past year.

FOREIGN WOOL TRADE.—The New-York *Tribune* says: By late English papers, it appears that wool, this spring, is not likely to sell for quite as high a price as it did last year, and although we are not wool exporters, this circumstance will be made use of to cheapen the prices of wool in this country. In fact, it has been already cheapened. Now we advise farmers not to be in a hurry to sell, for fear it will be lower in the latter part of the season, as they are always told will be the case, yet it very seldom happens to turn out that way. We do not know what a farmer can do, who is in debt, but sell his clip for the best price he can get. But there is once in a great while a farmer who is not obliged to sell, and it will cost him nothing but the loss of interest to keep his wool over till another year.

As to getting as much for wool this year as last, the farmer must not think of such a thing. All Germany is in a war panic, and woolen cloths will be sent to this country under our low tariff, and sold at such prices that every man who grows a fleece for sale will feel the effect of war prices upon wool in Europe, and a tariff made for the benefit of foreigners, instead of American farmers.

APPEARANCE OF CROPS.

THE WHEAT CROP IN MICHIGAN.—From information received through the local papers and other sources, we are of opinion that the prospect is now fair for at least an average wheat crop in this State. In the early part of the season, in some sections, the appearance of the fields was forbidding, the root of the wheat seeming to be winter-killed; but in most instances these fields have recovered, and are now promising. With no intervening calamity before harvest-time, the wheat crop of Michigan will be a fair one.—*Detroit Press*.

THE CROPS.—We never saw the wheat, grass, and oats, says the *Germantown (Pa.) Telegraph*, look more promising in any former year than they do at the present time. Our accounts, also, from the adjoining counties, confirm this opinion. Fruit—apples, pears, and cherries, promises a full crop; and even peaches, so far as we have seen, or are advised, have well escaped the rigors of the spring.

WHEAT.—A gentleman from Caledonia village, Livingston county, informed us yesterday that the wheat crops in that vicinity looked finely, giving promise of a large yield. The neighborhood is one of the best wheat districts in Western New-York.—*Rochester American*.

NEW-YORK CITY.—The city of New-York extends from the Battery to Kingsbridge, a distance of thirteen and one-third miles, and the width is one mile and three-quarters. Of this area, about one-fifth is compactly built upon. The vacant or upper part of the city is traversed lengthwise by seventeen avenues, which are again crossed by streets numbering from one to two hundred and twenty-nine. These streets form squares, which are surveyed for building lots of the size of twenty feet in width by one hundred in depth. The survey of New-York was commenced in 1811, by John Randall, Jr., under the direction of Gouverneur Morris, De Witt Clinton and John Rutherford, and occupied them ten years in its completion. The entire island was originally purchased of the Indians for twenty-four dollars, and it was estimated to be worth, in 1852, the sum of \$253,278,384.—*N. Y. Evening Post*.

"I FEAR God," said a man of good sense; "and next to Him, I fear only the man who does not fear Him."

ENOUGH.—There is philosophy in the remark, that "every man has in his own life follies enough—in his own mind, trouble enough—in his performance of his duties, deficiencies enough—in his own fortunes, evils enough—without being curious after the affairs of others."

SWITCH HIM ON.—A Rhode Island clergyman lately illustrated the necessity of corporeal punishment for the correction of juvenile depravity with the remark that "the child, when once started in a course of evil conduct, was like a locomotive on the wrong track—it takes the switch to get it off."

SPECIAL NOTICE TO ALL SUBSCRIBERS.

We find that by using such good paper, our volume of 832 pages will be quite large to bind, and especially large for those who wish to stitch their paper together with an index, without being at the expense of binding. To obviate this, we have concluded to be at the expense and trouble of making out an extra index with No. 26, so as to form a complete volume of the first 26 numbers. The index for the next 26 numbers will be given at the end of the year, or with No. 52. This arrangement will make it convenient for all, as the 52 numbers can be stitched or bound in two volumes with an index for each, or in one volume with the double index at the close.

We hope all will preserve their numbers, for there are many single articles each of which will be worth the price of the volume, for future reference. When the paper arrives from the post-office, a good plan is to see that it is properly folded, and then pin or sew it through the middle and cut open the leaves. It is very easy to stitch 26 numbers together. To do this, arrange them in regular order, and with an awl punch several holes about one-fourth of an inch from the back, and through these run a strong thread two or three times with a darning-needle, and the work is done. We have scores of volumes of papers, pamphlets, and addresses, thus prepared, which serve all the purposes of a bound volume, and occupy less room in storing and carrying. We would, however, prefer to see volumes of agricultural papers neatly bound and laid upon the book-shelves or tables of farmers. They are much better and more appropriate ornaments, than gilded volumes of trashy magazines or novels.

ONE WORD MORE.—We thank our friends for the liberal aid they have afforded us in extending the circulation of the *Agriculturist*. Our list has increased beyond our expectation, and we are daily encouraged to labor with the utmost diligence, to make our paper worthy of the confidence and admiration of our largely increasing list of readers. Our reliance for the continuance and increase of our list is upon those who are already readers. As stated above, we now divide the year so as to give either one or two complete volumes of the 52 numbers. Number 27 begins the second volume, or half of the year. We respectfully request all our present subscribers to make a little exertion at this time, and each send us on at least one new name. If you cannot get your neighbors to send on for a year, ask them to try the paper for six months, as in that time they will get a complete volume.

TO CORRESPONDENTS.—We have several communications on hand which we will look over as soon as we have time, and some of them will be published. It is no trifling labor to prepare for the printer many communications which we receive. Some are written so closely that there is not room to put in corrections, without rewriting the whole. We cheerfully prepare articles, unless there is manifest want of care on the part of the writer. If he does as well as he can, we make all needful changes and corrections.

As most writers doubtless wish to improve

their own style, we suggest to them to keep an exact copy of their communications, and then compare this copy with the printed sheet. They may often learn something in this way.

We are not anxious to receive original poetry. We have little space for rhyme, and we have good selections enough to last us a year at least. Good poetry, however, will not be rejected; but we advise all who attempt to write in verse to remember, that good *rhyme* does not constitute *good poetry*; on the contrary, some of the best *poetry* we have ever seen does not "*rhyme*" at all, while some of the best *rhyme* contains not a single *poetic* sentiment.

Markets.

REMARKS.—Flour, after some fluctuation, settled down to the same prices as per our last, with the exception of the very best qualities, which are from 12½ to 25 cts. per bbl. higher. In Corn there has been a great fall, at least 10 to 12 cts. per bu. Pork is from 37½ to 62½ cts. per bbl. lower. Beef and Lard no change. Tallow has fallen a little. Wool is dull and depressed.

Cotton has advanced ½ ct. per lb., Sugar is hardly so firm; Rice and Tobacco unchanged.

Money is a trifle easier, and stocks more firm, but how long this will last we cannot say under the present heavy responsibilities of the country, especially in railroad projects.

The weather has been more propitious, though considerable rain fell on the 14th inst. At the South they have had killing frosts as late as the 2d and 3d inst. almost unheard of before. Cotton and Corn have been injured greatly; in many instances, to the entire loss of the former, as it is too late to replant it. At the North it is too early to decide on the wheat crop. In many places it has suffered material injury, in others it looks highly promising. Other crops we cannot speak of more than to say, all will be very late. Fruit has not been so much injured as was anticipated.

P. S.—Just as we go to press the steamship *Atlantic* arrives from Liverpool, bringing news that Corn is still lower there, and Wheat and Flour hardly equal in price to last reports. Cotton is also very dull.

PRODUCE MARKETS.

Saturday, May 13, 1854.

POTATOES appear to be plenty this morning, though the price is still on the rise. The quality is only medium. Apples are very scarce and the quality indifferent. The dealers say, that if there are any in the country to come into market, they would be glad to see them here as soon as possible.

This year's growth of vegetables is getting more plenty, though the most is brought from a distance. Butter has a downward tendency. It is thought that most other farm and garden products will soon be lower.

Carter and Mercer Potatoes are worth \$4 50@ \$4 75, per bbl.; June, \$3 50; Common, \$3 25; White Onions, \$3 50; yellow, \$2; red, \$1 75; Russia Turnips, \$3; white, \$2 50; Carrots, \$2 50; Parsneps, \$3; Beets, \$3; Spinach, \$2 50; Rape Sprouts, \$2 25; Apples, \$4@ \$4 50; Green Peas, \$5; Rhubarb, \$8@ \$1, per hundred bunches; Radishes, \$3 50; Asparagus, \$1 50@ \$2 50, per doz. bunches; Green Onions, 50c., per doz. bunches; Leeks, \$1, per doz. bunches; Lettuce, 25c. @ 75c., per doz. bunches; Butter, 18@ 25c., per lb.; Cheese, 8@ 11c.; Maple sugar, 10; Eggs, 16c. per doz.

NEW-YORK CATTLE MARKET.

Monday, May 15, 1854.

THERE is a falling off in numbers from last week as was expected. Prices remain about the same. The general quality is better than for some time back, though there were some cattle in the yards that, without they are taken back to a feeder for some months, will never be beef. The best lots we saw, were from the Onida Co. distillers, New-York State one Illinois cattle owned by Thos. M. VAIL, and two droves from York and Lancaster Cos., Pa. They were truly worth looking at—and eating too. The prices

of good and poor cattle differ much less than the quality.

Washington Yards, Forty-fourth street.

A. M. ALLERTON, Proprietor.

KETCHUM'S IMPROVED MOWING MACHINE WITH
entire change of gear. The only successful mower now known.

Ketchum's Improved Machine, which we are building for the harvest of '94, was thoroughly tested last season, and the advantages gained by our change of Gear are in all respects as we designed, viz: durability, convenience and ease of action. The shafts now have bearings at both ends, which overcomes all cramping and cutting away of boxes. A counter balance is attached to the crank shaft, which gives it a steady and uniform motion. Each Machine can be thrown out of gear; there is great convenience in getting at each and every nut, all of them being on upper side of the frame; oil cups are attached to all the bearings, which, by the use of a wad of cotton, will hold oil for a long time, as well as protect the bearings from dust, grit, &c.; the finger bar is lined with iron its full width, which protects it from wear.

These and various other additions for strength, durability, &c., makes them the most simple and perfect agricultural implement in use. They weigh about 750 lbs. each, and can easily be carried in a one-horse wagon.

They will cut all kinds of grass, and operate well on uneven or rolling lands, or where there are dead furrows. This Machine took the highest award, with special approbation, at the World's Fair, it also received, during last season, one silver and four gold medals, and various other flattering and substantial testimonials of approval. We have spared neither pains nor money to make them deserving of public favor, and hope to be able the coming season to supply the great and increasing demand.

We take this occasion to caution farmers against buying cheap mowers, if they do (as was the case with many last year) they incur loss, vexation and disappointment.

In all cases where Extras are wanted, be sure to give us the NUMBER OF YOUR MACHINE.

(WARRANTY) That said Machines are capable of cutting and spreading, with one span of horses and driver, from ten to fifteen acres per day of ANY KIND OF GRASS, and do it as well as is done with a scythe by the best of mowers.

All orders filled by the subscribers. Office and Shop, corner of Chicago street and Hamburg Canal, near the Eastern R. R. Depot, in Buffalo N. Y.

HOWARD & CO.

Manufacturers and Proprietors,

For Sale by R. L. ALLEN, 189 Water street, N. Y.

The Mower is also manufactured by Ruggles, Nourse, Mason & Co., Worcester, Mass. for the Eastern R. R. Co., for Seymour, Morgan & Co., Brockport, N. Y. for Illinois, Iowa and Michigan. By Warder & Brokaw, Springfield, O., for Ohio and Kentucky.

31-39

MACHINE WORKS.

M. & J. H. BUCK & CO.'S MACHINE WORKS, LEBANON, N. H. Manufacturers of a great variety of wood working machinery, of the most approved style, simple construction, and effective and firm operation, to be found in the country; comprising complete sets for making Railroad cars, doors, sash and blind, ship-building, bedsteads, cabinet, and carpenter work, &c., &c. Also, some machines of peculiar merit, such as for single and double Tenoning, capable of making from one to four tenons at the same operation of any width, size, or length, on large or small timber, with relishing cylinder attached. Also, an improved timber Planing machine, with the addition of a side cutter, with which the top and edge of timber or plank is planed, whether square or bevel, at the same operation, and in the same time occupied in planing but one side on all other machines. They also manufacture circular, single, and gang saw-mills, flouring and corn mills, hand and power hoisting machines for storehouses, shafting, hangers, pulleys, and mill gearing of all patterns.

AGENTS.—R. L. Allen, 189 & 191 Water st.; S. B. Schenck, 163 Greenwich st.; Andrews & Jessup, 67 Pine st.; Lawrence Machine shop, 51 Broad st., and Lawrence, Mass.; Leonard & Wilson, 60 Beaver st.; Wm. F. Sumner, Crystal Palace. [36-tf.]

MONEY FOUND.—A SUM OF MONEY FOUND IN THE seed store, No. 187 Water street, which will be paid to any claimant who can prove the property and date of its loss.
R. L. ALLEN.

WILD TURKEYS.—TWO FIRST-RATE TURKEY COCKS of this breed. [35-36] Apply at 191 Water street.

WILD MEXICAN POTATOES.—These are raised from seed brought from Mexico three years ago. They boil dry and mealy, and are highly lauded for the table by those who have used them. They are as early as the Kidney, and the rot has not yet appeared among them.
R. L. ALLEN,
189 and 191 Water st.

POUDRETTE.

THE LODI MANUFACTURING COMPANY OFFER their Poudrette for sale in lots to suit purchasers, from a single barrel up to 4000 barrels, at their usual rates, \$1 50 per barrel for any quantity over seven barrels, delivered on board of vessel in the city of N. York, free of cartage or other charge. When 200 or 300 barrels are taken, a deduction will be made from the above price. That this article has stood the test of fourteen years trial is proof of its efficacy. It is the cheapest and best manure for corn ever produced, and it has the advantage of being useful in small quantities and harmless in large. It is a capital manure for peas, strawberries, &c., and all garden vegetables. Apply by letter or personally to the Lodi Manufacturing Company.
22-38 74 Cortlandt st., New-York.

PORTABLE FORGES AND BELLOWS.

QUEEN'S PATENT) THE BEST Forge in the market for Blacksmiths' work, Boiler Makers, Mining, Quarrying, Shipping, Plantations, Contractors on Railroads and Public Works, Copper Smiths, Gas Fitters, &c., &c. Also an improved PORTABLE MELTING FURNACE for Jewellers, Dentists, Chemists, and all others, both of which are constructed with sliding doors to protect the fire from wind and rain when used out of doors, and for perfect safety and free escape of smoke indoors. They are compact for shipping. Circulars, with particulars and prices, will be forwarded upon application. Cast Iron Columns for building constantly on hand. The above forge has been awarded three Silver Medals by the American Institute, New-York, and the highest premium (Diplomas and Bronze Medals) at all other Fairs wherever exhibited.
FREDERICK P. FLAGLER,
31-57 Sole Manufacturer, 210 Water st., N.Y.

GARDEN SEEDS.

A GENERAL LIST OF FRESH GARDEN SEEDS, imported and raised for R. L. ALLEN, 189 and 191 Water street.

PEAS.—Early May, Prince Albert, Early Warwick, Early Washington or June, Early Frame or June, Early Chariot, Early Emperor, Bishops Early Dwarf, Dwarf sugar, Dwarf Blue Imperial, Blue Prussian, Fairbairn's Champion of England, Large White Marrowfat, Black Eyed Marrowfat, and all of Knight's different varieties.

CORNS.—Early Canada, Large Sweet or Sugar, Stowell's Evergreen, Old Colony, Constantine, White Flint, Yellow Flint, Dutton Browns, and Tuscarora.

BEANS.—Early China, Early Valentine, Yellow Six Weeks, Early Mohawk, Large White Kidney, Refugee or One Thousand to One, Dutch Case Kidney, Large Lima, Horticultural, Cranberry, Green, Runner, White, Dutch Runner, Dwarf Horticultural, Red Mohawk, Turtle Soup.

BORCOLE OR KALE.—Green Curled Scotch Kale.

CALIFLOWERS.—Large Early London, Large Late, Walchren.

CELERY.—White Solid, New Silver Giant, Large Manchester, Seymour's Superb White.

CRESS.—Curled or Peppergrass, Water or Winter.

CUCUMBER.—Early Frame, Early White spine very fine, London Long Green, Short Green Pickley, Extra Long Green Turkey, English or West India.

EGG PLANT.—Long Purple, and White.

ENDIVE.—Green Curled, Broad Leaved Batavian.

CARROTS.—Long Orange, White Belgian, Early Horn, Large Atringham.

BEETS.—Early Blood Turnip, Flat Bassano, Long Blood Red, Small Long Dark Blood, Yellow Turnip, Early scarlet.

ONION.—Large Wethersfield Red, White Silver Skin, Yellow Silver Skin.

TURNIPS.—All of the varieties.

WATERMELON.—Mountain Sprout, Mountain Sweet, very fine, Long Island, Black Spanish, Citron for preserves.

TOMATO.—Large Red, Round Red, Large Yellow, Small Yellow.

LETTUCE.—Early Curled silesia, Early White Cabbage, Fine Imperial Cabbage, Royal Cabbage, fine Large Green Ice Head, Brown Dutch, Superb Brown Head, Large India, Ice Coss, Paris Green Coss, Hampton Court.

MELON.—Green Citron, Pine Apple, Skillman's Fine Netted, Nuique, Large Yellow, Cantelup, Large Musk.

RADISH.—Wood's Early Frame, Early Short Top Long Scarlet, Early Scarlet Turnip, Long Salmon, Long White, Naples, White Turnip, Yellow Turnip, Black Fall spanish, White Fall spanish, Rose Colored, Cuing Winter.

CABBAGE.—Early York or June, early Sugar Loaf, Early Flat Buttersea, Large French Unicorn, Large York, Comstock's Prem. Flat Dutch, Large Drumhead Winter, Large Flat Dutch, Large Bergen or American, True Green Glazed, Fine Drumhead Savoy, Green globe Savoy, Red Dutch, Wakefield, Charlwood's Prem. Flat Dutch.

RUBARB.—Early Tobusk, Myatt's Scarlet, Victoria.

ALL WHITE BLACKBERRIES, a new and choice variety, also, **BLUEBARK AND ASPARAGUS ROOTS,** fresh and of fine growth.

A CHOICE ASSORTMENT OF FLOWER SEEDS. 29-17

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, which are spurious.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master, and ask him to mark the envelope, *Registered by —, P. M.*

In writing, always give the Post-office (instead of the town) and the County and State. *Write these very plainly.*

Clubs may add to their number at the same rate per copy as was paid by the original members.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished with Harper's Magazine, one year for.....	\$4 00
" Putnam's do.....	4 00
" Knickerbocker do.....	4 00
" Eclectic do.....	6 00
" Little's Living Age do.....	6 50
" National Magazine do.....	3 50
" Dickens's Household Words.....	3 50

PUBLISHERS' ANNOUNCEMENT!

Twelfth Volume of

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B. The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon *its own merits*; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammelled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDD, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers,	-	-	-	\$2.00 a year, \$2.00
" Clubs of 3 do.	-	-	-	1.67 " 5.00
" do. 5 do.	-	-	-	1.60 " 8.00
" do. 10 do.	-	-	-	1.50 " 15.00
" do. 20 do.	-	-	-	1.25 " 25.00

The money always to accompany the names for which the paper is ordered.

The Post-Master, or other person sending a club of ten, will be entitled to one extra copy gratis. The Post-Master, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, *Weekly Tribune*, or *Weekly Times*, or any other paper or periodical in this city, not costing to exceed two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if enclosed and mailed in the presence of the Post-Master.

Communications for the paper should be addressed to the Editors; subscriptions, advertisements, and all matters relating to the business department, should be addressed to the Publishers,

EDITOR'S FARM NOTES.

FARMING IN EASTERN CONNECTICUT — RASPBERRY HILL FARM, &c.

HAVING got most of the matter for this paper into the printer's hands by Wednesday evening, we took passage on the favorite steamer Old Knick, which carried us safely over the Sound, and up the Thames river, to Norwich, (Conn.) We then passed over the Norwich and Worcester R. R. to West Killingly, and thence by stage three miles west to Brooklyn, the county town of Windham County, where we had in former times tried to sow a few seeds of agricultural improvement by way of lectures, and we desired to know how they were flourishing. The rain unfortunately prevented our making many observations, and we must defer to another time the general notes we intended to make of the present state of Yankee Farming in that vicinity, and we will now briefly notice the farm of MESSRS. PARIS and HENRY A. DYER, situated on Raspberry Hill, about five miles west of Danielsonville (West Killingly) Depot, on the Norwich and Worcester R. R.

Mr. PARIS DYER was for a long time engaged in commercial pursuits in Providence, R. I., till some 18 years since, when he came upon this farm with his son HENRY A., who is well known as the indefatigable Secretary of the Connecticut State Agricultural Society. He has also devoted much time to getting up an interest in agricultural improvements in his own town and county; and these efforts, seconded by several other enterprising farmers in that vicinity, have placed the Windham County Agricultural Society quite on a par with any other Society in the State.

Raspberry Hill farm and nursery presents a very fair illustration, of what may be done by an intelligent application of capital and labor in improving the soil. The farm contains near 200 acres of a heavy clay loam, lying upon a hill, and so situated that water flows out upon many parts of its surface. About 13 years since, the Messrs. DYER commenced a nursery, which now occupies 25 acres, and is well stocked with every variety of fruit and ornamental trees. This nursery has one of the finest collections of evergreen trees we have seen in this country. Their method of preparing the soil for a nursery is, to thoroughly drain and sub-soil, and then supply it with abundant well-composted barn-yard manure. Notwithstanding the unpropitious character of the soil, with this preparation, the trees grow vigorously and healthy. We noticed one peculi-

arity in this nursery which is worthy of remark. From 12 to 18 inches below the surface is a hard sub-soil, so compact that the roots will not easily penetrate it, and they consequently spread out laterally, and when taken up they are supplied with a great abundance of roots and fibres, and on this account they are well adapted to setting out with a prospect of living.

This farm has about forty acres of woodland, and the rest is all arable, though much of it is quite stony. Instead of investing their original surplus capital—as well as that derived from the proceeds of the nursery—in Bank or R. R. stocks, they have adopted what we consider as better economy, that of putting it into permanent improvements of the soil. They have already more than doubled the annual products of grass and grain on the remaining part of the farm, after deducting the richest portions which have been set aside for nursery purposes. The soil was formerly considered as only fitted to grazing, but it is now nearly all capable of yielding good crops of corn and other grains.

This improved condition has been secured by extensive underground draining, a liberal use of various fertilizers, and a judicious system of rotation of crops. They have seized upon every new kind of fertilizer, including large quantities of shell lime, ashes, plaster, bone shavings, poudrette, super-phosphate of lime, woolen rags, refuse animal matters, such as hoofs, calves' feet, &c., nitrate of soda, liquid sulphuric acid, ground bone, and especially of guano. Of horn shavings, they have applied to the soil with good profit, some 15 tons. All of these substances have been found more or less profitable, though they place first in the list, horn shavings at \$25 per ton, and second to this, Peruvian guano. They have used with good profit several thousand bushels of uncleaned ashes. With only about 25 head of stock, including horses, oxen, cows and young cattle, and about a dozen hogs, they make annually from 500 to 800 loads of rich compost manure. We requested Mr. HENRY A. DYER to furnish us for publication an account of their experience and success in draining, which we hope to receive for a future number.

RHODE ISLAND HORSE PREMIUMS.

THE following letter contains some very important hints, not only to the Rhode Island Society, but to every other similar association, and we hope it will be generally read, and be an incitement to a more just discrimination in making out future premium lists. We have looked over a number of such lists, and find that heretofore the larger premiums have usually been given to fancy or fast horses, rather than to that class in most extensive demand as work or

draught horses. It will be remembered that at the National Horse Show at Springfield, so little regard was shown for horses of the useful class referred to, that amid all the display of fine horses there exhibited, only four spans of draught horses were entered for premium. But hear our correspondent on this subject.

For the American Agriculturist.

I have received a premium list, issued by the Rhode Island Society for the Encouragement of Domestic Industry, for the benefit of that branch of domestic industry that breeds horses. I notice that while large premiums are offered for those varieties of horses that minister to the luxurious tastes of the wealthy citizen, the fast man, and the gentlemen of leisure, for the class that really needs encouragement, the Society offers a premium so ridiculously small as to entirely prevent any desirable competition. A premium of \$50 is offered for the best gelding or family horse, \$50 for the best pair of matched horses, \$50 for the best trotting horse, \$20 for the best saddle horse, and only \$10 for the best pair of draught horses.

It is well known that unlimited prices can be obtained by breeders for particularly fast, or particularly fine-looking, desirable carriage horses—and a horse that can trot in 2.25, is a small fortune to the lucky man that breeds, or oftener to the knowing man that buys him; and sufficient encouragement is thus offered to secure effort in the breeding of these varieties of horses. If individuals are willing to make effort, and raise means to secure a good show of such horses, I should like to be there to see it; and it is very well for the United States Agricultural Society or that of Rhode Island, to offer generous premiums for handsome and fast animals; but unless the Rhode Island Society is disposed to abandon its profession as expressed in its title, and to become an institution for the encouragement of domestic extravagance, instead of domestic industry, I see no reason for offering less premiums for useful than for fancy horses. If the wretched, broken-down hacks that are in the hands of our farmers, and the miserable colts that are got from mares past all other service, from disease or age, could be made to give place to well-proportioned, desirable draught horses, bred to the various kinds of service they are required for, much benefit would accrue to the common weal—but so long as the 2.40 principle maintains, and the premium lists of our agricultural societies read like the one before me, we cannot hope for it. \$100 are offered for the best stallion of any age. Suppose I offer an animal that is beyond question the best adapted to procure colts for the farmer and the drayman, do I have a chance for the

premium? Certainly not. I have no horses to exhibit, and am moved to this communication, simply from the interest I feel in the improvement of that class of horses that does not enjoy the patronage of the Rhode Island Society. *Horse Shows* are becoming fixed institutions, and some exertions should be used to make every exhibition further the same end, and there should be a unity of purpose through them all. Effort should be made to prevent this thrusting into the back-ground that most useful class of draught horses. D.

CULTURE OF THE FIELD CARROT.

BY A PRACTICAL FARMER.

THOUGH rather late in the season, we copy the following excellent article on the cultivation of the carrot, from the *Mark Lane Express*, just received, as the method given by the writer is nearly as well adapted to this country as to England. For a field crop, however, we recommend the Belgian White carrot in preference to the others mentioned, as it grows much larger. It can be sown very rapidly by a hand drill. These may be obtained at various prices, \$3 50, \$6, \$10, and upwards, which will sow accurately, evenly, and as fast as one can walk. The rows should be three feet apart, so as to admit working between them with a small horse cultivator.

The plants should be finally thinned to stand not nearer to each other in the row than six inches, as they frequently grow 4 to 6 inches in diameter, and in many instances still larger. In good ground, thus thinned, and with rows three feet apart, as great a crop can be obtained as if they were planted closer.

The writer of this article seems to be ignorant of the merits of the sugar beet, which we think more valuable for cattle, sheep, and pigs, than the carrot, though the latter is probably best for horses. The sugar beet is a great yielder, fully equal to the mangold wurzel, and much more palatable and nutritious. We gave brief directions for the cultivation of this beet on the first page, No. 1, of this volume.

There are numerous varieties and sub-varieties in the carrot tribe. Like all other plants designed for field culture, it has passed through many gradations, and under the fostering care of scientific growers it has been wonderfully improved in its nature and the abundance of its produce. Such is the productiveness of the carrot crop under the best culture, that few others can equal it. The potato crop cannot yield so large a return per acre, nor will the food of the potato bear a comparison in its fattening qualities with the carrot, besides its freedom from disease. It will also bear comparison with either the mangold wurzel or turnip crop: it is a far more valuable crop than either of them, and will yield pretty near as much weight of food per acre. The carrot crop has been known to produce 40 tons per acre, and frequently 30 tons are obtained. The average yield, however, on good soils and fair crops is from 12 to 25 tons per acre.

Variety—The varieties generally grown in field-culture are the Long Orange field carrot, the Improved Altringham carrot and the White Belgian carrot. I have grown these varieties, but am quite at a loss as to their respective merits; I believe them to be of equal value. I certainly had most profit from the White Belgian, but it was more owing to the soil and season than to the variety; moreover, the red varieties appear to retain most favor with the public, and, of course, meet with a more ready sale

at fuller prices; for farm service this is immaterial.

Soil—The soils best suited to the profitable culture of carrots are deep rich loams of moderate consistency, and rich reclaimed bogs; good sandy loams are well adapted for their culture; light sands and gravels, if well manured and pulverized to a considerable depth, will produce good crops; indeed, any soil of sufficient richness, and that can be cultivated to the depth of 8 to 12 inches, will bring admirable crops.

Preparation of Soil—To insure a crop of carrots the land must be thoroughly worked and well pulverized to a considerable depth, (not less than ten inches will suffice by any means;) it must be cleaned as much as possible from all root weeds, and the annuals must, if practicable, be made to vegetate, and then be destroyed before the carrot seed is sown, otherwise much difficulty ensues. The manuring should consist of old, well-fermented dung; and if applied early in the spring, and then plowed in and well incorporated with the soil, all the better; it will tend much to prevent the growth of "fangs," instead of the long roots. Should this be inconvenient, the common ordinary manuring may take place immediately before sowing, to be well and deeply plowed in and rolled down with a rather light field roller. It is not desirable to plant carrots on ridges, but on the flat they are less fangy, and, of course, more valuable.

Preparation of Seed—This is of more importance than is generally given to it. The seed should be mixed with earth, coal ashes, sand, or like material. Bone-dust, rape cake, or some of the new manufactured manures might with advantage be substituted, the object being to separate the seeds for drilling, while at the same time by a slight moistening they may be made to vegetate. This mixture, with a few grains of barley or white mustard thrown in, to mark the rows by its early growth, may be made, and regulated according to the quantity which the drill is known best to deposit; it is of no consequence as to the quantity of the mixture, providing the whole is evenly mixed; it is merely drilling in so much manure with the seed to promote its more rapid growth. From three to five pounds of seed are requisite for an acre.

Drilling—This may be very satisfactorily done by any good manure-drill capable of drilling-in mangold wurzel seeds, or turnips; or, if only a small mixture, say two or three bushels, is made, the common corn drill will do very well. The distance between the rows should be about twelve to fourteen inches, and the depth about one inch. If the land is dry and season unpropitious, it is best to roll or slightly harrow in; but if rain is likely to fall, it is best to leave the drills open. The months of April and May are best for sowing.

After-culture—This mainly consists of weeding, hoeing, and singling. These should all be done by hand, and as often as required. The first hoeing should be between the rows, and to take place as soon as the rows are discoverable; the next should be when the plants are sufficiently high to allow the hoe to be struck across the rows, so as to leave the healthy plants about six inches apart along the rows, sooner a little wider than less, as it is proved that a reasonable width apart gives the greater yield and finer roots. The weeding and singling should soon follow, when probably, if the land has been nicely managed, another hoeing in the month of June or early in July may complete the culture. Wide drilling and horse-hoeing are not applicable to the carrot crop. The young plant is of too tender growth, and requires careful nursing and continuous attention.

Storing—This is an expensive process, and is the great objection to carrot cultivation. It begins in October, and it can only be properly done by digging up the roots either with a three-pronged fork or other tool; they must then be gathered into carts, and led to the grave, and piled up as described for mangold wurzel or potatoes. Carrots are more subject to take heat than most other roots, and will require

greater care in storing; the heaps or graves must not be too large, or raised too high, nor covered down too thickly. They should have ventilating holes in the grave as long as the season will allow. The tops should be carefully cut off above the crown before digging, and taken to stock for immediate consumption. Burrows, in his communications to the Board of Agriculture, says: "The carrots keep best in the ground, nor can the severest frosts do them any material injury." He prefers to let them remain in the ground till March, when they are taken up in dry weather, and stored as above.

Application—The carrot abounds in nutritive matter, and does not require any process beyond cleaning to prepare it for food for cattle, horses, &c.; no steaming, no boiling. It is the most valuable of all roots for horses, and is proved to fatten cattle faster, and even cheaper, than turnips. The proper allowance of carrots for a horse is from 50 to 70 lbs. per day. All stock thrive well upon them. Cattle, sheep, and pigs fatten faster upon them than any other roots. If grown for sale, it is very valuable, making from £3 10s. to £4 per ton in the London market.

For the American Agriculturist.

NATIONAL POULTRY FAIR AND THE NORTHERN FARMER.

EDITORS AGRICULTURIST:

GENTLEMEN: My attention has just been called to an article in the April number of *Miner's Northern Farmer*, headed "National Poultry Fair in New-York." In this article Mr. MINER, after saying that it requires two weeks to print the two editions of the *Farmer* on a steam press! and further, that the readers of his paper must not expect to have detailed accounts of poultry shows, etc., etc., proceeds to deal out a mass of slang against the National Poultry Society, the Judges, etc. Mr. MINER appears to think that the Judges, in recommending that all large Asiatics be called *Shanghais*, meant to continue the old titles, and use them thus, "*Brahma Shanghais*," "*Chittagong Shanghais*." It is well known that the committee suggested that "*Shanghais*" should only be designated by their color. Mr. MINER boldly states that the committee acted from a prejudice against the name *Brahma Pootra*, and a desire to put down that popular breed. He might just as well say that there was a prejudice against the *Cochins* or *Chittagongs*.

Mr. MINER thinks that the introduction of the resolution was an *ex parte* matter and not sanctioned by the three Judges. Messrs. PLAISTED and TAGGART he knows would never assume such a position, and as Mr. GILES is the sworn enemy of *Brahmas* and *Chittagongs*, he is led to believe that he had the honor of the deed. Poor JOHN GILES!

Mr. GILES was not a member of the committee at all, and Mr. PLAISTED being an exhibitor was of course prevented from acting. Mr. MOORE, of Rochester, was absent, and the committee consisted only of the following gentlemen, viz.: Messrs. TAGGART, WILKINSON and ANDREWS. They agreed entirely as to the recommendation, and further, when it was introduced to the meeting of the Society, at which a great many of the Managers of the Society were present, and scores of the most distinguished fowl breeders and importers of the country, not a voice was raised against the procedure.

The "recommendations" and "resolutions" were fully discussed, and not concocted by outsiders. Mr. MINER laughs at the "resolution" recommending "That all full crested fowl be called *Polands*," and winds up his attempted severe remarks by wondering why the Judges did not sign their names to the reports. I am not prepared to believe that any of the gentlemen were ashamed to do so. They are not the men to shrink from any responsibility. I have written this brief article with no desire to object to Mr. MINER's views on nomenclature, and have no opinion to present at present, touching the

propriety of the resolutions of the Society. I wish in no way to oppose Mr. Miner's faith, but simply to assure him that the action of the Judges, and the movements of the National Poultry Society, have not been at all underhanded. The exhibition was a grand one, and if matters are managed as well at the future fairs of the Society as they were at its first one, I fully believe that the Society will be cordially supported by all of the reasonable poultry men of the Union.

NOT A JUDGE AT THE RECENT FAIR.

LENDING FLAX SEED; FLAX MILLS IN N. Y.; SENECA COUNTY FARMING, &c.

We are always glad to hear from "N' IMPORTE." The following letter alludes to several matters, and will be found interesting:

For the American Agriculturist.

In your last week's paper you speak of the loaning of flax seed at Dayton, O., as something novel; you also advert to a flax-dressing machine as though none were in operation in this State. The oil mill proprietors in this village, Waterloo, have lent out this spring about 1000 bushels clean flax seed to farmers who contract to sell them their crops of seed when harvested, and also to sell the mowed flax after the seed is threshed from it, at six dollars the ton, delivered at the flax machine here. This machine can break and clean four tons of the rough flax daily. There is another flax dresser at Penn Yann, another at Fort Plain, and others in that region and farther east.

Our farmers begin to find flax growing very profitable, since they find a market for the holm which was formerly thrown away. Much has been said about the flax crop exhausting the soil. True, its foliage will not collect ammonia from the atmosphere like that of peas, beans, and red clover. Yet with the same nitrogenous manures usually applied to Indian corn, a better crop of wheat may be got after flax than after corn, and with less work.

A great change is taking place in the rural economy of our once great wheat-bearing county. Thirty years ago wheat was the only crop grown for market; few farmers made more corn than to fat their own pork, and stock growing did not pay; but as the French say, all that is changed now. From being a large exporter of wheat and flour, little Seneca does not now grow wheat enough (mainly owing to the fly or *tritici*) to supply the home demand, and our millers have to go to Buffalo to buy wheat. Indian corn, that king of our cereals, is a never-failing crop under good culture; hence it generally receives all the stable manure of the farm, and well does it repay the outlay; it is now our great cereal crop, although oats and barley and Mediterranean wheat are grown to a considerable extent and profit. Pork, beef, cattle, and sheep—a drug before the advent of railroads—are now very dear. Instead of having to sell beef and pork at a low price for packing, it now goes off alive, or fresh slaughtered, by railway, selling within the freight of New-York and Boston prices; the same of poultry, butter, eggs, &c.

Tile draining is beginning to work wonders for those farmers who are making the experiment; but it is only from their successful example that we can hope for a more general improvement, either in the making and saving of azotized manures, or in tile draining, as the farmer is famed above all others for that professional egotism, which scouts all theory until proved by the most perfect results. If the soil of Western New-York was drift and detritus instead of alluvial deposits, better farming would be required, or the soil would have to be abandoned. If our farmers would expend a tithe of the money and labor in tile draining that Mr. HOLBROOK, of Croton, and many others, have expended in constructing a soil on their barren precipitous hills, they would either grow rich on the increase, or the present enormous high prices of farm products would be lowered. But

slack farming is at least productive of one good, it holds back the farmer's family from falling into those habits of fashionable expenditure, so much on the increase in this fast age.

One of your city papers gives us a ludicrous description of the dilemma a New-York citizen gets into when he turns farmer. The man who would escape from high rent, forestalled market, and corporation taxes, to live in the country, should be satisfied with a farm of garden size, which he may work himself in default of cheaper help. But he had better first ascertain whether he has a real passion for the vegetable creation, or only a conceit. If his enthusiasm is only on the surface, it will go off with the first perspiration in planting the first tree, or trenching in the first manure; when he will be worse off than the retired tallow chandler, who left his suburban retreat with its flagrant flora, to enjoy once more the effluvia of a big melt of decomposing grease and tallow. N' IMPORTE.

Waterloo, N. Y., May 13, 1854.

MILKING COWS.

To insure the greatest yield of milk from a cow, she should not only be well fed and well tended, but also well milked. Now it is not every man or every maid, who can squeeze fluid from a cow's udder, that is a good milker.

It is important, in the first place, that a cow's bag should be clean. For this purpose, when the animal is stabled—as they are, or should be during the winter, on all farms, and throughout the year, by many—let the whole udder be washed with cold water, and immediately thoroughly dried with a towel. The advantages of this practice to the health of the animal, and the healthiness of the milk, are great and manifest; and in this way, too, we escape the black sediment of which milk-buyers so constantly complain, and which is nothing else than small particles of manure, brushed from the bag and belly of the cow into the milk pail. The hands of the milkmen by this process become washed clean, of necessity; an operation too generally omitted by those who consider themselves neat and careful. The same process obviates, too, the supposed necessity of moistening the teats by milking a fine stream into the hands and washing the teats therewith,—a filthy practice, followed by almost all men, and too many women.

The udder being now cooled and cleansed, we are ready to begin milking. If the cow be well trained, she will now extend backward her hind leg for your convenience, without a word accompanied with the word of command "*hoist*." They understand what is required of them, and need only at times, a gentle reminder. But it is a singular fact, that men who are kind in every other relation of life, as husband, father, neighbor and master—are rough in their treatment of gentle "*bossy*." If they say "*hoist*," it is in sentorian tones; and too generally, the first intimation of their wishes is conveyed in a striking manner, by the edge of a heavy milking stool. Now a considerable experience among the "*milking mothers of the herd*," has convinced us that harshness of tone, or petty cruelty, is not only not productive of good results, but is extremely disadvantageous. Many cows, that hold up their milk to a cross milker, will give down freely to one more gentle. And the sack of grain, or other weight across the loins, which is well used to compel the animal to give down, would have been uncalled for if a kind hand had always drawn her milk, or could be dispensed with, if gentleness takes hold of the teats.

Now the cow may kick. Well, we have in previous numbers of this journal shown that to return kick for kick is a poor method of converting Mooley from the error of her ways, but she may be completely cured by kindness.

When fairly seated, it is of the utmost consequence that the milking should be done without violence, and as rapidly as possible. Many persons who pride themselves on their fast milking,

jerk the teats violently, and others will cause them to become sore by the pressure of their finger nails. The best milkers scarcely move their elbows, but with the upper portion of the hand grasping and compressing the teat, force the jet of milk by the pressure of the lower fingers.

Whether a cow should be milked before, after, or during feeding is a question of minor importance, and must be decided by circumstances. R. L. ALLEN, in his excellent work on "*domestic animals*," recommends, if we rightly remember, that they be milked while feeding, for the reason, that while thus engaged they will more readily let down their milk; but many cows, at other times quiet, will be a little uneasy while eating, and anxious to get not only all that belongs to them, but a share of their neighbor's meal also. For this reason we always milked before feeding that the feed might appear as a reward of merit. Where one has but one or two cows, it is of course a matter of little moment.

In fine, we recommend to those who want much milk and good milk, *kindness and cleanliness*.—*Journal of Agriculture*.

LARGE vs. SMALL EGGS.

PROBABLY the largest hen's egg ever recorded is that recently laid by a hen of C. R. White's, the landlord of the Warriner House, Springfield. It is a foot in circumference the long way, *nine inches* the other, and weighs 11½ ounces! It is well shaped, with a very thick and hard shell. It is almost impossible to believe that it is the product of a hen; but we have been convinced of it. The egg probably contains four yolks—it is certainly four times the size of an ordinary hen's egg. The hen that laid it is believed to be of the ordinary breed, but is very large, weighing about eight pounds alive. She has been in a feeble state of health since the production of this monstrosity in the egg line.—*Conn. Valley Farmer*.

Did not some wag put a goose egg in biddy's nest? As a contrast to the above story, we have a Bantam hen's egg, measuring 3½ inches round longitudinally, and 2½ inches transversely. Its weight is 5 pennyweights and 6 grains. The hen has laid several eggs of about the same size this spring. We challenge the world to beat this; and also to show a smaller full grown hen, where nothing has been done to stunt its growth.

POULTRY CHEAPER THAN PORK.

THE following, which we find in the *Texas Telegraph*, may apply to a certain extent in that State, but in the great valley of the West, where corn is not worth over 20 to 40 cents per bushel on an average, we fancy pork can be produced much cheaper than poultry; besides, one can never take the place of the other, though poultry is unquestionably much the healthier meat.

Build a good, comfortable hen-coop, such as you would keep your hogs in. Keep fowls, feed them; and make a careful estimate of your fowls and hogs, together with the products of each; you will find that fowls are more profitable stock than hogs. Pork cannot be made at less than five cents a pound with any breed of hogs. Each hen, if well cared for, will yield a clear profit of one dollar a year. To care for them and produce this result, it is necessary to give them a good place to roost, a variety of grain, with a little animal food, with clean water, and lime in some shape for eggshells. The fowl manure annually wasted in the United States is worth at least \$1,000,000. To save it, place a layer of loam and plaster occasionally over a layer of the manure. Every spring mix all together, and use it at the rate of a pint to

a hill of corn or cucumbers, squashes, pumpkins, melons, peas, onions, strawberries, or any other fruit, vegetable, or grain, and you cannot fail to have an improved crop. This is American Guano, and is as good as that brought from the island off Peru, at heavy cost.

HAY MAKING—ARE YOU READY?

THERE is every prospect that Western farmers will, during the coming season, experience much difficulty in procuring assistance at harvest. For several years past, labor has not been as plentiful as was requisite; but at the present moment, the making of so many railroads, California and Australia, the increase of our mercantile navy, &c., are absorbing all the spare hands, and raising wages beyond what farmers can well afford to pay. Under these circumstances, only three modes of acting appear to present themselves, viz.: 1, to pay wages so high, that men will be tempted to leave their present occupations for the summer; 2, to put in a very limited supply of spring crops; or, 3, to purchase or hire machines, whereby a few boys and men can rapidly accomplish the work of many men. Fortunately, there are many farmers in the West, who have no more hay or grain to harvest than they and their families can attend to; these will experience little or no difficulty; but there are very many more who *must* have assistance, or their crops are injured and wasted by delay. In every such case, *where the fields are smooth and sufficiently free from stumps*, we strongly recommend the use of machines; and we call attention to the subject thus early in order that arrangements may be made in time.

Owing to our peculiar position near a large city, where hands are easily procured, and in consequence of the stumps yet in our fields, we have had no personal experience with hay and grain machines; but we have conversed with farmers from many localities who *have* used them, and we never met with one who was not more than satisfied with them. A few weeks ago, we had a long talk with a very intelligent farmer from Northern Illinois—one who puts by 500 to 600 tons of hay annually—and his mode of proceeding may prove interesting to our readers. He has two hay machines, each working with a span of horses, and driven by a young boy. Each of these will cut twelve to fifteen acres a day; or twenty acres, if the horses are changed at noon. He begins in the morning as soon as the dew is off, and cuts until about noon. As each stalk of grass falls where it stood, and is not put in swathe, as when cut with a scythe, it dries very rapidly; and as soon as dinner is over, two or more revolving hay rakes are put on, which rake the hay into windrows. A very large, long-toothed rake, having two horses, one at each end, and a little boy on each horse, is then applied to the end of a windrow, and a pile, of 5 to 7 cwt., is at once thrown up. The wagon is now ready, rigged with a very long wide rack, so that a ton of hay when loaded, will only be a few feet high; two men pitch and one packs away. All the hay is put into barns, where bays are arranged for the purpose, and here is a great improvement on the old system. A wooden gallows, with a pulley at the end of the arm, is so arranged in front of the bay as to be rapidly moved to any position in which it is required; a rope is run through the pulley, there being at one end of the rope a large fork with long steel teeth, and at the other end a horse. The wagon is driven into the barn; the fork stuck into the hay so as to lift 2 or 3 cwt. of it; the horse goes ahead; lifts it up; the gallows swing round; and the man in the bay, by means of a short rope, attached to the fork, tips it where he wishes; the horse backs up, and the operation is repeated. By this means, a ton of hay can be unloaded in three or four minutes; and about 12 acres put by daily. We leave it to our readers to calculate with how many hands, and at what cost, they can in the old way cut and put by this quantity in a day. By these machines,

two boys and four men appear to be quite sufficient, while the cost per ton, every thing included, is reduced, at least, one-half. In case, there is less grass to cut, as in the majority of instances, one cutter, one revolving rake, and one large rake will be sufficient for the field, and the number of hands requisite may be smaller. If the weather is fine, and there is no danger of rain, our informant would cut one day and haul the next, especially in the beginning of the season, when the grass was very green. In this case he uses salt as he packs away, but if the hay is very dry he uses none. There are now many machines in the market both for hay cutting and grain harvesting, each claiming to be superior in some particular. In some instances the hay-cutters are adapted for this purpose alone, costing from \$100 to \$120, and capable of serving, with ease, on an ordinary farm, for 10 or more years. In other instances, the hay and grain machines are combined, slight alterations fitting them for either purpose, and the cost being \$250 and upwards. Where the price is too high for one individual, two or three neighbors might unite in the purchase; and we believe, in some instances, grain-harvesters are carried round from a farm to farm, in the same manner as threshing machines, the owner finding a team, and doing the work. Several of the manufacturers require only a small payment down, content to receive the balance when the grain is sold—a mode of purchasing which will enable many to procure a machine, while they would be precluded by a demand for cash. There are now, also, several patterns of horse rakes. In the great majority of them, the driver walks behind, and regulates the implement with his hands. The *Revolvers*, as they are called, are decidedly the best of this kind, and for rough land they can be had with steel teeth. Others are fixed on wheels, the driver standing on the rake, and working it with his foot.—*Farmer's Companion*.

GAPES.

I know of no remedy so effectual as that suggested by Mr. Tegetmeier, viz., the obliging chickens to inhale the fumes of turpentine, which may be accomplished by heating the turpentine and placing it with the chicken in a covered vessel of some kind. The turpentine may be kept from contact with the chicken by placing an inverted flower-pot over the cup or vessel that may contain it, or a feather dipped in turpentine, and very carefully introduced into and *twisted round* in the windpipe—not the gullet—is equally effectual, and I think less troublesome; one or two applications are generally sufficient.—*Zenas, in Poultry Chronicle*.

TREATMENT OF GAPES.—In one of the numbers of your useful publication, I see that a correspondent calls the gapes "an incurable disease." As I have yearly reared a large number of chickens, I think it right to state that I have found spirits of turpentine, if not a specific, at least an almost certain remedy for this complaint. I have administered it in two ways, and both successfully. First, with chickens of larger growth, by dipping a feather in the spirit and passing it down and turning it round in the throat of the patient, by which means the little worm causing the complaint is sometimes extracted, but nearly always destroyed; and secondly, with young birds, dropping a few very small crumbs of bread saturated with the spirit into their pens, which, if hungry, they will pick up quickly. I know a gentleman, a very large breeder of fowls, who always gives his chickens, at six weeks old, wheat steeped in turpentine. This is given to them *once* in the morning when fasting, and as a prevention against, instead of waiting for, the arrival of gapes. I may trouble you again on this and other subjects relating to poultry, should you think further communication likely to prove interesting to your readers.—*D. B., in Poultry Chronicle*.

CLAIMS OF AGRICULTURAL PATENTS

FOR THE WEEK ENDING MAY 9, 1854.

MACHINERY FOR DRESSING FLAX.—E. L. Norfolk, of Salem, Mass.: I do not claim the employment of trunks with moveable lids, by the rising and falling of which the rate of feed is regulated.

But I claim governing the movements of the rollers, which supply the material to the machine by means of wedges, which are suspended in such a way as to be caused by the rising and falling of the movable lids, or their equivalents, to rise and fall, and thus regulate the position of bars, which are acted upon by eccentrics or cams for the purpose of transmitting motion to the feed, and thereby regulate the amount of motion which the said bars receive from the said eccentrics or cams, as set forth.

PUMP.—Jacob Edson, of Boston, Mass.: I claim, first, the tube, in combination with the air chamber, constructed and operating as set forth.

Second, the cup, in combination with the holes and the packing, constructed and applied to a force pump, as described, and for the purpose set forth.

Third, the inclined partition in the rear of the spout, operating as set forth.

CULTIVATORS.—C. K. Farr, Hinds Co., Miss.: I claim the bed with inclined sides, as described, which, following the trace of the coulter, renders the sides of the furrow compact, and prevents the falling in of the earth, as set forth.

WEIGHING AND PRINTING BUTTER.—Wm. S. Reinert, of Spring Garden, Pa.: I claim the combination of the mold or vessel for containing the butter, suspended to the lever or scale beam and its attachments, plunger or piston, having the desired configuration on its lower surface, and upright rod and button for raising the circular plate or piston in the bottom of the said vessel or mold, together with the levers for operating the same for weighing, forming, and branding or imprinting with and desired configuration, the butter in parcels, and discharging the same from the vessel or mold, as set forth.

MANURE AND SAND LOADER.—H. G. Marchant, of Annisquam, Mass.: I claim the transportable manure loader, consisting essentially of the following elements in combination, viz., the body or box, the trough, and the rake, constructed, and arranged, as described.

SEED PLANTERS.—G. S. Enoch, and Daniel Wissinger, of Springfield, Ohio: We claim the mode of adjusting the tappet wheel, in combination with the peculiar form of the sliding bar, to suit the nicest differences in any desired quantity of seed to be sown, as described.

ARRANGEMENT OF FRICTION ROLLER IN INCLINED PLANE HINGES.—Enoch Woolman, of Damascoville, Ohio: I claim in the described hinge making and arranging the roller, so that it can be traversed towards and from the pivot of the hinge in combination with the scores in the inclined places, so that it can be used either as a self-shutting or self-retaining hinge when open or partially so, as set forth.

SCREW JACKS.—Francis Davis, of Keene, N. H., (assignor to J. M. Reed, of Swansey, N. H.): I do not claim the use of a right and left screw, as that has been made use of before; neither do I claim constructing a screw-jack entirely of iron.

But I claim as a new tool or instrument for the purpose of raising heavy bodies, the jack, constructed and operating as set forth.—*Scientific American*.

WHERE THE GRAIN GOES.—At a Whiskey Manufacturers' Convention held in Cincinnati last week, twenty-three establishments, mostly in Ohio, were represented, the whole of which are said to consume over 14,000 bushels of grain daily, or upwards of four millions per year, out of which ten million gallons of whiskey are produced.

Horticultural Department.

TO HORTICULTURISTS. — Our weekly issue of so large a journal, gives us ample room to devote to the different departments of cultivation, and we have commenced with this volume, to allot a separate space to Horticulture. We have secured additional efficient aid in its conduction, and we invite horticulturists generally, to send in their contributions on all subjects interesting and instructive to those engaged in similar pursuits with themselves. We are receiving the leading foreign and domestic horticultural journals, and shall be abundantly able to bring promptly before our readers all that transpires, which may be new and useful.

PENNSYLVANIA HORTICULTURAL SOCIETY.

COUNTRY SEAT OF MR. CALEB COPE. — We were highly gratified in our visit on the 16th inst., to the annual exhibition of the above Society, in the Chinese Museum in Philadelphia, which was every way worthy even of this excellent Society. The arrangements were good, and the plants were both fine and abundant.

Among the *rare* plants on the tables we will name *Begonia Hanthina*, a newly imported plant with beautiful foliage and yellow flowers; also a specimen of *Schomburghkia tibiscum*, an orchid so called in honor of Sir R. SCHOMBURGH, the discoverer of the *Victoria Regia*; and *Stelilgia regina*, also *Castilleja Coccinia*. New-York was honored in receiving the premium for beautiful *Calceola*, from Mr. THOMAS RICHARDSON's country-seat at West Farms; DAVID SCOTT, gardener of Mrs. HOLBROOK, N. Y., also received special commendation for very large and well formed seedling *Calceolarias*, and other cut flowers and indigenous flowers from Mr. R. R. SCOTT. Contributions of flowers were on exhibition from Mr. COPE's, Mr. BUIST's, Mr. DUNDAS', and nearly all the other green-houses and conservatories in the vicinity. Altogether the exhibition was highly satisfactory; yet, if we must speak comparatively, truth compels us to say, that the plants as a whole, were not as fine specimens or so well trained, as those at the Brooklyn exhibition reported in our last — in fact we have never seen at any show in the United States, so handsome and well-grown plants as Mr. MENAND and Mr. PRENTICE, of Albany, had on exhibition at Brooklyn.

Very large and perfect specimens of the Newtown Pippin apples, from Mr. HULL, of Alton, Ill., were exhibited. The strawberries, lemons, and grapes, as well as a handsome show of vegetables, were highly creditable. Mr. FELTON and JEROME GRAFF, gardener to Mr. CALEB COPE, appeared to be the principal exhibitors in the vegetable and fruit line.

We are happy to state that at the meeting of the Society in the evening, by the energetic courtesy of the President, and the mutual forbearance of the members, the strawberry controversy was amicably settled, and the tomahawk buried. We think few, even of the most experienced gardeners, know in reality much about strawberries, or that they keep the different kinds distinct enough, to carry much authority or influence in the statement of their experiments. We were pleased to hear Mr.

COPE remark, that McAvoy's Extra Red was the most productive large strawberry, for it accords perfectly with our own experience in this matter.

The next day it afforded us much gratification to visit the magnificent country-seat of Mr. CALEB COPE, some six miles north of Philadelphia. It comprises about one hundred acres, and we were told that it was worth more than one hundred and fifty thousand dollars. The barn alone cost fifteen thousand dollars; and is probably the most perfect and largest in the country. Some six or eight double conservatories were filled with the choicest things. The half of three of them were filled with grapes and fruit trees. The grapes and peaches were ripe, and the nectarines and apricots were fast maturing. We were pleased to see a small tree of the celebrated Stanwick Neetarine in bearing. It had five noble specimens of this rare new fruit, which will soon ripen. Another house was filled with Camellias, and another with oranges and lemons, figs, &c.; the fruit was of monstrous size — particularly the lemons. Another house was filled with rare orchids, in great perfection, and another still with caetui. And lastly, came the far-famed *Victoria Regia*, in a house built expressly for it, and furnished with a constant supply of warm water, which has flowed for years into the tank. A small water-wheel is kept constantly in motion for the purpose of keeping the water from stagnation. The plant has now twelve leaves, of five to six feet across, scattered over the surface of the tank. We were fortunate to find it in flower, and the blossom was some eight inches across, or as large as a man's hat. The color is of a delicate pink, until its last stages, when it shades into a more brilliant red, and is very handsome, although not of high perfume. The flower was picked, and kindly presented to us, and we took pleasure in carrying it to New-York. After exhibiting it to a few amateurs, we placed it, duly marked, in one of the most prominent windows in Broadway, for the gratification of the public.

Mr. COPE's taste and enterprise, and generous expenditure, has contributed largely to advance the horticultural art in this country; and we therefore take especial pleasure in calling attention to his doings.

FLORICULTURE.

FUCHSIAS. — These are now generally grown on what may be termed the one-year system of cultivation, for the plants are mostly only of one year's growth from the cutting state; or sometimes old stems of the height of 5 or 6 feet are made into plants furnished at regular distances with laterals, upon the ends of which there is often only one bunch of flowers. Now, take a plant of this description, and compare it with one the same height in the shape of a compact pyramid, covered with finely-formed and well-colored flowers, and it will at once be apparent which is the most creditable specimen. Pyramids, however, take three and often four years to come to perfection, as I will presently show; but before I do so, permit me just to describe the sort of place best adapted for growing them in, which is a low span-roofed house or pit well ventilated, and having a south aspect. This house should contain a well-made pit, which may be filled up with broken brickbats to within 9 inches of the top, where there should be 6 inches of rough coal-ashes, and then three inches of fine ashes on the top for the plants to stand upon, and which will keep them dry and

clean. It will be found necessary to have the pit of three different heights, so that the plants may always be near the glass. The path may either pass round the house or through its center, as may be most convenient. It is not every one, however, who has got a house or pit like the one just described; those who have not such convenience, must therefore be content with what they have, but care must be taken that it is a house which can be well ventilated, and capable of receiving at all times the benefit of the sun. In beginning to form pyramidal plants, take cuttings in March, and strike them in the propagating-house or some other suitable place. As soon as they are struck, pot them off into three-inch pots, using a mixture of maiden loam, leaf-soil, and sand. Put them into a frame, but do not plunge them. Keep the frame moist, and maintain a temperature in it of from 55° to 60°, giving a little air on fine days. As soon as they begin to grow, and have got well-rooted, increase the amount of air given them. In a very short time the pots will have begun to get well filled with roots, when the plants should be shifted into six-inch pots, using a compost of maiden loam of rather strong texture, about one-third leaf-soil and well-rotted dung, and a sprinkling of sand. The plants will now require the support of a small stick, but be careful not to tie tightly. They may now be taken out of the frame, and put into the house or pit in which they are intended to be grown. Place them near the glass, and give plenty of air on all favorable occasions; syringing them slightly in the morning, and damping the paths frequently during the day, to keep up a moist atmosphere, which the plants enjoy, and in which they will grow vigorously. Here they will soon begin to push laterals, which must be stopped when they have reached 2 or 3 inches in length; for it is by stopping the laterals that a compact pyramid is obtained. They must, therefore, never be allowed to run, or it will be useless to attempt to obtain a pyramidal plant; stop them all as they come out within 2 or 3 inches of the stem. Be careful not to let the plants get pot-bound; and, therefore, as soon as the pots begin to get well-filled with roots, let the plants have their final shift for the season, which should be into ten-inch pots, using soil as before, but not in a fine state. See that the pots are well drained, which is of great importance. This time, instead of putting a layer of moss over the drainage, as is often done, use fibrous turf, such as is left after the soil has been sifted out of it. The plants should now have a good stake put to them. Give them a slight syringing morning and evening, also all the air possible on fine days, and a little may now be left on at nights. All the laterals that were stopped before, should now be stopped again, as they require it. After they have been stopped twice, they may then be allowed to run, but do not let them bloom too much, for it will rob the plant of its support, and bloom is of no importance until you have obtained a fine specimen. The plants will now be growing vigorously; see therefore that they have a liberal supply of water, and abundance of air, and a little more air may now be left on at nights. It is by giving plenty of air, and using soil of rather a strong texture, that you obtain short-jointed and well-ripened wood, which is what is required in order to have Fuchsias in perfection. As the wood ripens so withhold water, and when it is quite ripe they may be kept dry, and the house or pit cold. Keep them in this condition until the beginning of February, then let them be pruned in to one or two eyes from where they were last stopped, when a foundation will have been laid for a pyramidal plant. Give them a good soaking with water, when they will soon begin to break. As soon as they are well broken, let them be turned out of the pots, the old soil shaken from them, and the roots pruned in a little. Then pot them in small pots, using soil as before. Keep the house rather close for a few days, giving a slight syringing in the morning. Continue the same treatment as re-

commended above, throughout the second and third years, and by that time you will have got a well-formed specimen plant, worthy of a place in any exhibition or conservatory. The following year they may be allowed to bloom, therefore the laterals will not require to be stopped. Let the soil used for potting be of a strong texture, and give abundance of air on all favorable occasions, whereby you will get short-jointed wood and fine bloom.—*E. A., in Gardeners' Chronicle.*

NEW-ENGLAND SPRING FLOWERS.

Continued from page 151.

THE leaves, which appear subsequently, are on long petioles, rounded or heart-shaped at base, and cut into three or five toothed lobes, which are separated by a sharply-indented sinus. They vary much in outline, though always preserving their general character. Early in the autumn, before the warm weather has quite departed, they begin to assume the gay coloring which has given a name to the tree. This rich scarlet is first seen in a few leaves, then in a few branches, and finally whole trees are clothed in its gorgeous magnificence, when the foliage of other trees still retain the fresh green of midsummer.

The cause of this change in the color of foliage at autumn, has given rise to much speculation. It has been generally ascribed to the action of frost, inasmuch as the change takes place at the time when frost generally appears. But modern research and observation have proved this to be a fallacy. This tree, in particular, is adduced as a proof that frost or even cold is not necessary to produce the change, as it is often found clothed with its autumn dress before the first sign of frost. Leaves may be found at all seasons of the year, which have changed color from premature decay. The best explanation yet given, is, that the cellular structure of the leaf becomes gorged with an internal deposit, in the same manner as the stony portion of fruits is formed, and that a subsequent chemical action upon the green chlorophyll produces the alteration. The leaf is, in fact, ripe. The skins of many fruits retain their green hue until ripe, and then assume a bright color, which does not depend on cold, but on maturity. The texture of this fruit skin does not materially differ from the skin of a leaf blade. The maturity of a fruit is its incipient decay. It no longer grows, but decomposes. Those fruits which, like apples, may be kept for a long while, only resist longest the action of decomposing agents; they are not living, but slowly decaying, to make food for theseeds they contain. The chemical action which the vitality of the leaf opposed, begins to take place at once on its death. Therefore we believe that the forest leaves ripen and perish in their season, and that their bright beauty is the result of their death. The cold breath of winter may kill them, but it is not that cold itself which paints them with purple and gold.

One other early species of maple which is found in the western part of the State, is the WHITE or SILVER-LEAVED MAPLE (*Acer dasycarpum*, Ehrhart.) It grows more loosely than the red maple, and is easily distinguished from many peculiarities. The flowers appear before the leaves, and are of a greenish yellow. The samaras are always green, downy when young, but smoother when mature, with two large, thick, diverging wings, on pedicels an inch long. The leaves are more deeply cut, and whitened beneath with a silvery down, which glistens in the sunlight when the wind agitates its branches. Like the red maple, it has been extensively used as an ornamental shade-tree; and though destitute of the gay colors of the former, its foliage and mode of growth are more graceful.

The maples typify the order ACERACEÆ, and are its only representatives in the North. At the South is found the ASH LEAVED MAPLE, or BOX ELDER, *Negundo Aceroides*, (Manch.) which was classed with the acers, by Linnæus, and

differs in its primate leaves, and constantly diœcious flowers. No single genus of trees is of more varied importance to man. They furnish one of the most useful woods for a great variety of purposes; one species (*A. saccharinum*) yields a delicious sugar, and all are highly ornamental in cultivation.

To go from the lofty to the lowly, let us notice a charming little flower which appears very early upon the dry hills—the FIVE FINGER, or CINQUE-FOIL (*Potentilla Canadensis*, L.) From each root spring several creeping stem, which run over the ground, giving forth leaves and flowers at intervals, which become longer as the plant gains strength. The leaves are on long petioles, and are cut into five obovate, wedge-shaped, distinct leaflets, which are sharply toothed at the top, and covered on both sides with a silky down. They are accompanied by two downy stipules, which are both cut into three sharp, lanceolate lobes. The flower is on a long slender peduncle, springing from the axils of the leaves. The calyx is cut into five lobes, alternating with five bracts, which are so much like the calyx as to make it seem ten-lobed. The five petals are rounded and obovate, longer than the calyx, and of a bright golden yellow. They are lightly attached at the base, and soon fall away. A second bloom appears at the end of the summer. The numerous short stamens surround a cluster of pistils, which become, on ripening, a close, flattened head of small pointed seed-vessels. The whole plant is covered with a soft, silken pubescence.

We have described only one variety of this species of *Potentilla*. Modern botanists have placed under the name of *Canadensis*, given by Linnæus, two distinct varieties. The one under consideration is the *sarmentosa* of Muhlenberg. It is early, never erect, always in dry soils, and of a slender, starved growth. The other *P. simplex* of Michaux, appears later, is twice as large in every part, greener and ranker, standing erect, or leaning upon the tall grass, and growing in damp soils. The difference between them is such as might be caused by the difference of situation; yet intermediate forms do not so often occur as might be expected. When plants of any extended region are examined together, many nominal species are found to run gradually into each other, which would be considered certainly distinct in an isolated locality.

We will close this chapter of our desultory descriptions, with an account of a flower, universally known and esteemed as one of our sweetest spring beauties—the WILD COLUMBINE or HONEYSUCKLE (*Aquilegia Canadensis*, L.) It grows in dry places from the crevices of rocks, sometimes covering a loose, crumbling declivity for a considerable distance, with its brilliant blossoms. The stem is smooth, a foot or more high, branching widely at the top, and bearing on its ultimate divisions the large solitary flowers. The lower leaves are twice triply divided, the first divisions being long, and the second ones short stalked. The leaflets are variously cut and lobed at the apex. The stem leaves are gradually reduced to three simple lobes, or even a plain ovate form. They are all smooth, except where the petiole embraces the accompanying branch; the sheathing, stipular portion is there pubescent. The flowers are of a brilliant scarlet on the outside, and a rich yellow within. The five ovate sepals are petaloid in texture and color; they curve outward at the base, and become nearly erect, overlapping and exceeding in length the yellow petals. These are peculiarly formed. The rim of each would give the outline of any common form of leaf, with an apex, two sides, and a base; but the blade is drawn downwards into a long, hollow, tubular spur, which gradually diminishes in diameter, and is thickened at the point. These were termed nectaries by the older botanists. Under this name they classed every honey-producing apparatus of the flower, and even the strange or uncommon appendages which produced no honey. Modern writers do not now

classify these parts under a general name. They no longer recognize the nectary as a separate and integral portion of the flower. The parts so named are considered to be merely peculiar developments of the organs on which they occur. The stamens of the columbine are numerous, gathered together in a conical bundle in the center of the flower. From the center of these spring five long, thread-like styles. The flower hangs drooping from the apex of the nodding stalk, so that the spurs are upright, and the stigmas pendent. But when the flower falls away, the stem resumes its upright position, bearing five separable carpels, erect, and tipped with the persistent styles. They open inwards like a dry pod, exposing numerous seeds.

All the May-day ramblers eagerly seek for wild columbines, as they are only found in warm, sunny situations, so early in the year. It flowers profusely a week or two later. Its brilliant colors and elegant foliage, make it highly prized by the young herborists of the season. Nor is it less welcome to those of older growth, to whom, more than to children, it is significant of the coming season of beauty; to whom its grace and loveliness are an epitome of that perfect harmony which reigns in the whole natural world.

The columbine is another representative of the order RANUNCULACEÆ, which furnishes so many of our early flowering plants. The European species *A. vulgaris*, is very common in our gardens, and is an instance of that tendency to procure foreign plants, with an idea that they must be more beautiful than our own. Our species is more elegant in every respect than the European one, and better deserves cultivation.

We have by no means described all the early spring blossoms. There are others, less familiar, but equally worthy of our examination. There is something greatly attractive in the first signs of summer life, and we feel peculiar gratification at the discovery of the first specimens of favorite flowers. If our readers are willing to again look over our shoulder to notice the plants we cull, we will at once proceed to collect another bouquet.

GARDEN FARMS IN VIRGINIA.

LAND in the vicinity of Norfolk is said to be rapidly advancing in price. The Argus states that small farms on Tanner's creek, that a short time ago were bought for a few hundred dollars, now sell rapidly at thousands. One that was purchased only a few years ago at \$1400 has been subsequently disposed of at \$5000, and it was cheap enough at the advance of \$3600, or of more than 250 per cent. The Argus thinks that "all that is required to make a fortune on a small farm near Norfolk—now that we are supplying the tables of the hotels and private houses of the northern cities with fruit, vegetables, &c.—is a small capital, industry, and some knowledge of the way of cultivating the soil to the best advantage. One thousand baskets of strawberries, and one hundred barrels green peas were shipped by Mr. P. H. Whitehurst, Saturday, to New-York, where they command a ready sale at high prices. Another sent eight barrels rock fish and ten barrels eggs. We are informed by this individual, that he has two thousand two hundred empty barrels in readiness for the heavy business he intends to do shortly in fish, vegetables, fruit, &c.

THE WATER LILY.—It is a marvel whence this perfect flower derives its loveliness and perfume, springing as it does from the black mud over which the river sleeps, and where lurk the slimy eel and speckled frog, and mud turtle, whom continual washing cannot cleanse. It is the very same black mud out of which the yellow lily sucks its obscene life and noisome odor. Thus we see too in the world, that some persons assimilate only what is ugly and evil

from the same moral circumstances which supply good and beautiful results—the fragrance of celestial flowers—to the daily life of others.—*Margaret Fuller.*

CAPSICUM PLANT—(Pepper.)

MR. JAS. CUTHILL, in the *Mark Lane Express* strongly recommends every person to grow their own pepper from the pods or fruit of the Capsicum plant. He says:

The plant is of so easy growth, that little need be said about its cultivation. A couple of pennyworth to start with can be bought at any seed shop. The seed can be sown any time in April, in a pot, and slightly covered over with the same mold; if the seed pot is placed in a moderate heat, it will the sooner come up.—When the plants are two inches high, pot them off singly into pots, or plant them in a warm corner of the garden, a foot apart each way. Nothing more is required than to water them with a little rich water now and then. Should the red spider attack the plant, a little flower of sulphur dusted on the under side of the leaves kills the spider. The fruit or pods of the Capsicum will be ripe by September; but if some are green it does not signify. The pods are then dried in an oven, or before the fire, then pounded, and if you have a mill to grind them smaller, so much the better. A few plants will grow as many pods as will make enough Cayenne pepper to last for years, and one thing you know, that the thing is genuine. The green pods also make a fine hot pickle, mixed with cucumbers, vegetable marrows, &c.

THE OLIVES OF GETHSEMANE.

At the foot of the Mount of Olives we find what is considered the garden of Gethsemane, memorable as the resort of our Lord, and as the scene of the agony which he endured the night he was betrayed. There is little doubt that this is the real place of this solemn transaction. It seems to have been an olive plantation in the time of Christ, as the name Gethsemane signifies oil-press. It is about fifty paces square, and is enclosed by a wall of no great height, formed of rough loose stones. Eight very ancient olive trees now occupy the enclosure, some of which are very large, and all exhibit symptoms of decay, clearly denoting their great age. As a fresh olive tree springs from the stump of an old one, there is reason to conclude that, even if the old trees existing in the time of our Lord have been destroyed, those which now stand sprang from their roots. But it is not incredible that they should be the same trees. They are, at least, of the times of the Eastern empire, as is proved by the following circumstance:—In Turkey every olive-tree which was found standing by the Moslems when they conquered Asia pays a tax of one medina to the treasury, while each of those planted since the conquest pays half its produce; now the eight olive trees of Gethsemane pay only eight medina. Dr. Wild describes the largest as at twenty-four feet in girth above the root, though its topmost branch is not above thirty feet from the ground. M. Bové, who traveled as a naturalist, asserts that the largest are at least six yards in circumference, and nine or ten yards high—so large, indeed, that he calculates their age at 2,000.—*Ancient Jerusalem.*

CINNAMON GARDENS IN CEYLON.

Picture a wild plot of fine white sand, in which grow, in irregular tufts, bushes of a perennial green, but of a green of every shade, varying from the faintest yellow to the most sombre brown. Nothing can be more delicate in hue than the first tender leaves of the cinnamon-bush, as they shoot forth variously from the branches, half opening, half curling up, as if afraid to trust themselves to the broad, glarish

light of day. Their flavor, too, is a faint, pleasant, aromatic one, that tempts the early wanderer to pluck them occasionally as he brushes past; and whilst the dew is rising in vapor from the leaves, caught up by the morning sun, it carries with it a delightful perfume of the spicy shrub, which makes the air peculiarly pleasant.—*Forest Life in Ceylon.*

BLACKBERRY WINE.

A CORRESPONDENT of the *Southern Planter* writes as follows: "It may not be known to many of your subscribers that they possess in the blackberry, grown so unwillingly in their fields, the means at once of making an excellent wine as a valuable medicine for home use. To make a wine equal in value to port, take ripe blackberries, or dew berries, and press them; let the juice stand thirty-six hours to ferment; skim off whatever rises to the top; then to every gallon of the juice add a quart of water and three pounds of sugar, (brown sugar will do;) let this stand in open vessels for twenty-four hours; skim and strain it; then barrel it until March, when it should be carefully racked off and bottled. Blackberry cordial is made by adding one pound of white sugar to three pounds of ripe blackberries, allowing them to stand twelve hours; then pressing out the juice, straining it, adding one-third spirit, and putting a teaspoonful of finely-powdered allspice in every quart of the cordial, it is at once fit for use. This wine and cordial are very valuable medicines in the treatment of weakness of the stomach and bowels, and are especially valuable in the summer complaints of children."

A DINNER AT THE PRESIDENTIAL MANSION IN OLDEN TIMES.

THE following letter was addressed by a member of Congress to his wife, during the administration of President John Adams. It describes a dinner at the President's House, and gives a pleasing illustration of the domestic economy of that period:

PHILADELPHIA, June 9th, 1797.

My dear Maria: I wrote you a few lines yesterday, and promised you a long letter by this day's mail. The grounds of my promise were, that, having dined at the President's, I certainly could not lack for materials to compose a very handsome letter indeed, and one of no small importance. Our House were so earnestly engaged in debating the question "*whether a man has a right to defend himself when attacked by robbers or assassins,*" that we did not adjourn until after 4 o'clock (the hour at which we were to dine.) We therefore went straight from the House of Representatives to the President's, and were introduced by name to the President, who shook hands with us, and introduced us to Mrs. Adams, who rose to receive our bow. We then sat down, and the waiter handed round a glass of punch, which, permit me to say, was very agreeable, after having sat for five long hours hearing a *very dry* debate on a *very clear subject*.

In a few minutes dinner was announced, and one of the gentlemen handed Mrs. Adams into the dining-room. The President followed, and the company followed him. Mrs. Adams sat at the head of the table, and the Secretary at the foot, and the President sat at one side near the middle. The company took their seats altogether promiscuously, except that the Chaplain of our House, who said grace, sat at Mrs. Adams's right hand. Grace having been said before we took our seats, we had nothing to do but to attend to our business. But here it is necessary to give a description of the bill of fare, and the arrangement of the board; but I am very much afraid that I shall not only be inaccurate, but that I shall fail in giving a brilliant and interesting description of this important subject. As I wish, however, to be as good as my word, I shall attempt it. There were about twenty persons at table. The utensils were

only common blue china plates, glass tumblers, and wine glasses. The table was decorated or garnished with glass stands, five in number. On the two extremes were only dishes of common lettuce or salad; next to these, towards the center, at each end, was a piece of pastry work, resembling a large cake baked in a tin pan, and turned up side down and decorated with rose-buds just opening. In the center there was a large cake of the same form, but it was incrustated on the outside with a fine white frosted surface, spangled with sugar plums in the shape of cocked hats, shells, radishes, &c.

The dishes were nine or ten in number, viz.: at the head, a piece of beef *a la mode*; at the foot, a large roast pig; then, alternately, fish, a leg of mutton, tongue, boiled fowls, ham, corned beef, a dish of small birds, chicken pie, and perhaps two dishes more—I cannot be certain. All these, however, were preceded by soup, not calf's-head, but common. The vegetables were peas, salad, potatoes, (new ones, but very small,) cranberry sauce. The dessert: tarts, custards, jellies, ice cream, blanc mange, strawberries, cherries, (very poor,) raisins, almonds, &c. And the wines: Madeira and port.

Mrs. Adams was very sociable, and helped to carve, &c. The President carved the ham, which was before him, and was very attentive to all the guests. After a few glasses, Mrs. Adams withdrew, with her daughter, Col. W. S. Smith's wife, who said nothing, that I heard, all the time she sat at the table. We drank the United States, and no toasts or sentiments, but did just as we pleased, and took a *French leave* when it suited. The President told the gentlemen, as he saw them retire, that there was coffee above, if they chose it. The day was hot, and I believe but few went up. I sat until there were but three or four left, and then retired.

WOOLEN AND COTTON MIXED GOODS.

THERE are many who think when they have purchased a piece of "cheap woollen goods," they have made a great bargain. There never was a graver mistake committed. Thousands and thousands of pieces of goods are sold in the shape of narrow and broadcloths, as being all wool, while in fact they are composed of at least twenty per cent. of cotton. The latter is mixed and carded with the wool, and all being dyed with the same color, it is very difficult to detect the imposition. We presume that many merchants sell such goods under the belief that they are genuine—composed wholly of wool. The manufacturers know all about the deception, and no doubt the great majority of the large merchants are aware of the fact also. Any imposition practised upon the community in the shape of an article of manufacture, deserves the severest censure.

Cotton can easily be detected in any piece of goods, even when mixed in the process of carding, by submitting a small strip of the goods to the action of a little sulphuric acid, mixed with very hot water. The acid will discharge the color from the cotton, while the color of the wool will remain almost unchanged. There are very few colors, in cotton, but what are far more fugitive than those on wool; this is the reason why the warm sulphuric acid solution is a good test for cotton in cloth.

LAND IN WESTERN NEW-YORK.—The *Rochester American* states that Hon Samuel Richmond, of Bergen, Genesee county, harvested last season a field of wheat of nine acres, averaging forty-two bushels to the acre. Recently he sold the wheat at two dollars per bushel.—Thus he pocketed eighty-four dollars for the produce of each acre. Farms in Bergen are said to be selling at \$100 to \$150 per acre.

You may glean knowledge by reading; but you must separate the chaff from the wheat by thinking.

American Agriculturist.

New-York, Wednesday, May 24, 1854.

BOUND VOLUMES.—We have a few sets (26 numbers) of volume eleventh, bound and unbound. The price, at the office, of the unbound volumes is \$1.00. The bound volumes are neatly put up in cloth covers, gilt backs, at \$1.50.

We can also furnish the covers separately, gilt and all ready for putting in the paper, for twenty-five cents each. With the covers thus prepared, any bookbinder can complete the binding for twenty-five cents. Volumes sent to the office will be bound complete for fifty cents.

We are having printed a new edition of the first ten annual volumes of the monthly *Agriculturist*, which can be supplied for \$1.25 per volume or \$10 for the set of ten volumes.

BACK NUMBERS.—We have taken the precaution to print each week a large number of extra copies, so that we can still supply new subscribers with full sets from the beginning of this volume, (March 15.) Any copies accidentally lost by a subscriber, will be freely supplied. Specimen copies sent to any person, whose address is furnished post-paid.

STATING IT RATHER HIGH.

OUR neighbor of the *American Agriculturist* says, that potatoes, "intelligently cultivated, yield from 75 to 200 barrels per acre." Now we should like the names of men who raise 200 barrels of potatoes to the acre at the present day; we should like to see how large an army could be mustered under that head.

It is this perpetual exaggeration—this substituting fiction for fact—to a great extent, which creates what is called prejudice against "agricultural writings." Instead of prejudice, it is mainly a well-grounded distrust.

Let a young farmer buy his land and manure, and go to work as "intelligently" as a man can, to cultivate potatoes, calculating on 200 barrels per acre. We do not say that he might as well depend on drawing a prize in a southern lottery; but we do think that he stands nearly the same chance of being struck by lightning in the course of the summer; and, with mad dogs as plenty as they are, twice the chance of being bitten by one of them. Such statements in agricultural journals should always be put under the head of "Fiction."

We copy the above from the *New-York Evening Post*, and understand it is from the pen of the editor of its weekly agricultural column. As we publish no "fiction" column in our journal, but on the contrary endeavor to make all its agricultural matter as reliable as possible, we will proceed to give such few well-attested statements of large products of potatoes, as happen to be now at hand, showing that not only 200, but that in one instance at least more than 400 barrels have been produced per acre.

But first, as to the number of bushels per barrel. We have just accurately measured several of the size that potatoes are usually brought to this market in, and find that they average 2½ bushels per barrel. This would be 500 bushels in 200 barrels, the quantity stated by us which could be produced by intelligent cultivation from an acre.

The following products of potatoes were sworn

to before the Committees of the Ulster and the Clinton County Agricultural Societies. See Transactions of the New-York State Agricultural Society for 1852, pages 221 and 377.

CALVIN EVEREST, of Peru, Clinton Co., N.Y., raised 567 bushels from one acre.

PETER CRISPELL, Jr., Hurly, Ulster Co., N.Y., raised 554 bushels.

By reference to the *Cultivator*, Vol. 2, No. 2, April, 1835, page 24, there will be found a letter from T. A. KNIGHT, copied from the *British Farmers' Magazine*, stating that he had produced potatoes at the rate of 887½ bushels and 3 lbs. per acre. We presume the writer of this was Prof. KNIGHT, late President of the London Horticultural Society, one of the most reliable, most practical, and most scientific men of his day. He stood as high in English horticulture then, as Prof. LINDLEY does now.

In Vol. 3, of the *Cultivator*, pages 165 and 183, Mr. KNIGHT gives the details of the products of potatoes at the rate of 539, to over 1200 bushels per acre; and large as this latter quantity is, he stated it as his candid opinion that it could be exceeded. We could give other statements taken direct from British publications if it were necessary, showing that over 200 barrels of potatoes from an acre is not considered an extraordinary yield there.

The *Cultivator* at this time was edited by the late JESSE BUEL, one of the best practical farmers of his day, and one of the most careful of editors in what he admitted into his journal. He asserts on his own responsibility, Vol. 3, page 164 of the *Cultivator*, that 560 bushels of potatoes have been produced from the acre, which would be 224 barrels, 24 more than our assertion.

In the season of 1833, the late Mr. E. HOLBROOK, then residing at Hyde Park, Dutchess County, N. Y., raised upwards of 750 bushels of potatoes per acre. Some time after this, Mr. H. returned to this city, and built the beautiful residence, now occupied by his widow, at the corner of Fourth avenue and Seventeenth street.

The *Yarmouth (Mass.) Register*, in the autumn of 1844, contained the following paragraph: "Mr. THACHER CLARK, of Dennis, has raised the present year from one rod of ground, six bushels of potatoes, being at the rate of 960 bushels per acre. Pretty fair for Cape Cod sand."

The Reports of the Massachusetts Agricultural Society often give large products of potatoes. At this moment we can only refer to one, that of PAYSON WILLIAMS, of Fitchburg, Worcester County. The product was within a fraction of 570 bushels per acre—228 barrels.

One year we produced within a fraction of 300 bushels per acre, with the most ordinary cultivation. As late as the first week in June, we turned a piece of sod land flat over with the plow, planted 3½ feet apart, without manure, and only hoed them once. Had we planted them 20 inches apart, and carefully manured and hoed them twice, we do not doubt we might have got over 500 bushels—or 200 barrels per acre.

By trenching the soil two or three feet deep, and manuring highly, or taking a soil naturally rich, like the river bottoms or prairies of the West, and planting the potatoes six inches apart, and then carefully cultivating them, as

we have often seen Irishmen do, an incredible quantity can be raised per acre in a good season. We have often heard good gardeners say, that they should consider 600 bushels under such circumstances, nothing more than a fair average product.

We have somewhere read of a well-attested product, in New-Hampshire we think, of over 2000 bushels per acre. We can hardly credit this however, and suspect there was some mistake in measuring.

We think we have now pretty well substantiated our assertion, that 200 barrels of potatoes can be raised from an acre of well-cultivated ground; and we trust the *Evening Post* will have the candor to copy our justification, as we do not wish to be classed among those who make assertions which cannot be proved.

THE "NEW BREAD" HUMBUG.

SOME time since we saw an article in the French and English journals, announcing an "Important New Process of Making Bread," in which it was stated that, by a new discovery made by a French gentleman,—a pupil of Orfila,—a sack of flour (280 lbs.) produced 540 lbs. of bread, while a sack of equal weight, baked by the ordinary process, produced only 360 lbs. It was further stated that this marvelous increase does not arise from any weighty substances mixed with the dough, as no extraneous ingredient can be discovered in the loaf by the most rigid chemical analysis.

On the first appearance of this announcement, although in respectable papers, we at once stamped it as a humbug unworthy of notice. We should not now call attention to it, had we not seen it copied extensively all over the country, and without a word of dissent from more than two or three papers. On page 22 (No. 2) of last volume, we gave a somewhat lengthy description of the chemical principles involved in bread making, and a reference to that article will be sufficient to do away with any reliance upon the above announcement. We will, however, repeat here, that by the ordinary process, 100 lbs. of flour will produce about 150 lbs. of bread, not because it receives any addition to its nourishing substance, but because during the baking operations the 100 lbs. of flour absorb about 50 lbs. of water. If this 150 lbs. of bread be thoroughly dried in such a manner as to lose nothing but its water, the bread will weigh less than 100 lbs., because some of the solid portions of the flour are lost by fermentation, and the flour itself contained several per cent. of water while in its usual state, which will be lost by drying.

Now if the French bakers, by some peculiar manipulations, can make 225 lbs. of bread instead of 150 out of 100 lbs. of flour—in other words, if they can make 100 lbs. of flour absorb 125 lbs. of water instead of 50 lbs., we ask, *cui bono?* to what good? It is the solid gluten, starch, and oil of the flour that we want for nourishment, and the value of these are not increased because united with more water.—JOHNSTON, in his large work on Agricultural Chemistry, tells us that certain bakers have been detected in adding to flour sulphate of copper (blue vitriol)—a rank poison—for the purpose of making it retain more water. We

should suspect something of the kind in this new "discovery."

We have just now learned from an English paper, that Prof. J. H. PEPPER, Chemist to the Royal Polytechnic Institution, has produced even a greater weight of bread than was obtained by the French (secret) process. His results were obtained by adding to the flour about one-ninth part of its weight of rice. He tied up in a thick linen bag *one and a half* pounds of the best American rice, allowing it ample room to swell. This he boiled from three to four hours, until it became a smooth paste, and then dusted in and most vigorously kneaded with it *fourteen pounds* of the best flour, adding the usual quantity of yeast and salt. The rice certainly cannot render the bread unwholesome, while it will cause it to keep moist a longer period than ordinary bread; but if purchased it should be remembered that the real worth of such bread is not more than about two-thirds as much as the same quantity of bread made from flour only.

STATE OF THE CROPS.—The weather of the present spring is so unusual, that it is especially desirable to gather as full information as possible from week to week, in regard to the state of crops, fruit, &c., throughout the country. We shall endeavor to keep our readers posted up on these matters; and we especially request all who may have occasion to write us on business or otherwise, to send on a separate slip of paper, a brief statement of the condition and prospects of crops and fruits in their vicinity.

HOW MUCH SUGAR DO WE EAT.—Eight or ten months since we wrote a short article under the above head, which has since gone the rounds of the American and English press, and now comes back to us in the *N. Y. Observer* credited to the *Western Christian Advocate*.

SALE OF IMPROVED STOCK.

We desire to call attention to the advertisement of Mr. J. M. MILLER, of his regular sale of stock. It is a great convenience to breeders and the farming community to hold such sales, and they ought to come off at least twice in the year—once in the spring and once in the fall. Here those who wish to sell can meet with those who wish to buy. If well patronized, it may ultimately grow up to a great stock fair, such as they semi-annually hold in Great Britain and other parts of Europe.

The place selected for the above sale is very convenient of access. Mr. BATHGATE can furnish every accommodation desirable to those who send their stock there for sale. His stables, fodder, and pasturage are ample for all.

TO START CORN AND GIVE IT A RAPID GROWTH.

Owing to the cold weather and long-continued rains the two past months, corn planting is unusually late this season. It is of great importance, therefore, to start it quick, and make it grow rapidly. For this purpose there is probably nothing equal to Peruvian Guano. A proper application of 150 to 300 lbs. of this valuable fertilizer to the acre, will often secure from 20 to 50 per cent. greater crop; the grain will be

heavier and of superior value per bushel; and what is most important, it will ripen from five to fifteen days in advance of the unmanured. If early frosts come in the fall, this advance in ripening may save the crop. Let every farmer consider this well. Three days advance in ripening is often very important.

We trust our article in last week's paper, on the subject of cultivating corn for fodder, will also be duly attended to. We hope every farmer will plant enough at least for a *three month's supply* for all his stock. He will then be on the safe side in case of drouth, or an advance in the prices of grain and fodder. The farmers of this country have every inducement to raise an extra quality of grain and fodder this season. Prices for all their products rule high, and bid fair to keep up for some time to come.

SEASONABLE PREMIUM.—The Royal Agricultural Society have offered a premium of \$1000 (£200) for a steam cultivator, which shall do the work of the spade or plow more economically than either of those time-honored implements.

DR. WATTS ARRIVED—IMPORTATION OF SHORT-HORN CATTLE.

It will be recollected that this gentleman, in company with Mr. WADDELL, went out to England several months since, for the purpose of importing more cattle and sheep, for one of the Ohio Stock Companies. Dr. WATTS returned in steamer Europa, on the 19th inst. Mr. WADDELL was to follow him from Liverpool the next day, with the cattle, in a ship for Philadelphia.

Dr. W. informs us that he found improved stock of all kinds very high throughout Great Britain and Ireland—for their purchases extended to the sister isle—and that the breeding of these is extending as fast as the means of farmers will permit, all over the United Kingdom.

The weather in England had been uncommonly fine for the past two months. The crops had been got in well, and such as are up, are highly promising.

Dr. W. expresses himself highly delighted with this his second visit abroad. The farmers there are a noble, hospitable race, and the country never was so rich and prosperous.

They purchased about thirty head of Short-horns in all, mostly young animals, and a lot of South-down and Long-wooled sheep. We hope to announce their safe arrival in two or three weeks.

Improved stock is in great demand here this spring. We have had more inquiries, and heard of more sales than usual. England has accumulated vast wealth from this source alone, and America may follow rapidly in her footsteps, if she will only make use of the same means as the mother country has, to bring about so desirable a result.

For the American Agriculturist.

CAKED UDDER IN COWS, (Garget.)

EAST HAMPTON, May 16, 1854.

Will you please inform me through the medium of your weekly journal, what I shall do with a cow whose udder is very much caked? The cake appears to be in one teat. I use cold water freely, and have in a measure succeeded in bringing it down; but before milking again it

is as bad as ever. The calf is about three weeks old.

A. FARMER.

The best remedy for the above is, to let the calf run with the cow and suck it as often as possible. The next best which we have practised is, to take the roots of the *bitter-sweet*—which is common in all our forests—cut them up fine, and steep them in hot water, making the decoction quite strong. Pour off this liquid, then mix it half and half with lard, and rub the cow's udder and teats well with the mixture twice a day, and milk her at least three times each day. Cold water is very good as applied by our correspondent, so is rubbing the udder with milk fresh drawn from the cow. But the bunting and frequent suckling of the calf is best of all. The cow should be turned into pasture, if not already there, and be allowed no other food than the young, tender grass, so long as the caking continues.

The proper name of this disease is *Garget*.

For the American Agriculturist.

LUCERN--WEEVIL--DRILL.

Will you oblige me through the medium of your paper, with information as to the means of getting rid of the weevil—the culture of Lucern, and whether there is any drill for small seeds such as parsneps?

A SUBSCRIBER.

We are sorry to be unable to recommend any sure means of getting rid of the weevil.

We refer "A Subscriber" to the seventh number of this volume (April 26th) for an article on Lucern, with the remark that in this latitude the seed may be sown later than there directed, perhaps as late as May 25th or June 1st.

There are a variety of Seed-Drills operating very well, which may be procured at most agricultural stores. A small Hand-drill for garden seeds may be procured for \$3 50. A larger one, costing \$6, will answer both for a garden and field drill, and another still better costs \$10. Then there are still larger drills, to be drawn by a horse, which are used for sowing grain. We unhesitatingly recommend the use of a drill for all kinds of seeds. The saving of labor will soon pay for the cost of the drill; and the more equal distribution of the seed, and the more uniform depth at which it is buried, will in a great majority of cases produce a crop ten to thirty per cent. better than the hand sown. Another important item is that one-third less seed is needed when the drill is used.

CROTON MILK.—It is intimated that the scarcity of milk in New-York a few days ago was occasioned by the break in the Croton dam.—The milkmen indignantly deny the rumor.

LYONS MANUFACTURES.—The chief business of the French city of Lyons is the manufacture of silk goods, and it is said that the annual value of the goods exported from that city to New-York does not fall far short of \$25,000,000.

MARKS ON NEWSPAPERS.—Lines drawn around or marks made on a paragraph of a newspaper *merely* to call attention to the particular article, are not held, in the Post-office Department, to subject the said newspaper to letter postage.

Boys' Corner.

THE BOY WHO KEPT HIS PURPOSE.

THE following interesting story we have seen in several exchanges, and do not know where it first appeared. We suppose by the signature, that it is from the pen of ANNE HOPE, the writer of the beautiful article in our last number on the sorrow of a "Sad Iron."

"I would not be so mean," said George Ward to a boy, who stood by, while he put the candy he had just bought in his pocket.

"You have no right to call me mean," replied Reuben Porter, "because I don't spend my money for candy."

"You never spend it for any thing," continued George tauntingly.

It was true. Reuben did not spend his money. Do you suppose it was because he loved it more than other boys do?

Reuben turned slowly away, meditating upon what had occurred. "I will not care for what George thinks," he at length said to himself, "I have four dollars now, and when I have sold my cabbages, I shall have another dollar. I shall soon have enough," and his heart bounded joyfully, his step recovered its elasticity, and his pace quickened, as the pleasant thought removed the sting the accusation of meanness had inflicted on his sensitive spirit. Enough did not mean the same with Reuben, as with grown people. It had a limit. He hastened cheerfully home, or to the place he called home. He had no father or mother there, but kind and loving friends in their stead. Mr. Porter had died two years before, leaving a wife and four children without property to sustain them. Reuben was the eldest, and as he was old enough to assist in the labors of a farm, it was thought best he should leave his mother. Mr. Johnson, a neighbor, took him into his family, where he soon became a great favorite.

There was one thing about the boy, however, which good Mrs. Johnson regarded as a great fault. It was what she called "a spirit of hoarding." She said she never gave him an orange, or an apple, that he did not carry it to his room, instead of eating it. Perhaps his sisters at home, or dear little brother Benny could tell what became of them.

Mrs. Johnson had noticed, too, in his drawer, a box, which was quite heavy with money. She did not believe he had bought so much as a fish-hook, since he had been in their family. If he should go on in this way he will grow up to be a miser. Mr. Johnson smiled at his wife's earnestness, and remarked, that with such an example of generosity as Reuben had constantly before him, he could not believe the child was in much danger from the fault she feared. "It must be remembered," he said, "that Reuben has his own way to make in life. He must early learn to save, or he will always be poor. There are his mother and sisters, too, who need his aid."

In various ways Reuben added to his store. When the snow came, he made nice broad paths about the house, which so attracted the notice of a neighbor, that she asked if he might be allowed to make paths for her. He rose early that he might have time for his extra work, and was well paid for his efforts. The box grew heavier from week to week. *Reuben had almost enough.*

One day there was a barrel of flour left at Mrs. Porter's. She thought there must be a mistake about it; but the man said he was directed at the store to take it to that house. Mrs. Porter went immediately to learn about it, and what was her surprise on finding her son had been the purchaser. How could he pay for a whole barrel of flour? "The money," said the merchant, "he brought in a box. It was in small bits, which took me some time to count, but there was enough."

The mother called, with a full heart, at Mrs. Johnson's, and related what had occurred. Reuben wondered why his mother should cry so. He thought she would be happy. He was sure he was. He had been thinking two years of that barrel of flour, and now he felt more like laughing than crying. Those tears, noble boy, are not tears of sorrow, but of the deepest, fullest joy. You are more than repaid for your self-denial. You have persevered in your determination; you have resisted every temptation to deviate from the course which you marked out as right. You have borne meekly the charge of meanness so galling to your generous spirit, and now you receive your reward. You are happy, and so is your mother, and so are your kind friends, Mr. and Mrs. Johnson.

That night, Mr. Johnson remarked to his wife, as they sat together before the cheerful fire, that he had some idea of keeping the little miser and educating him. "A boy who could form such a purpose, and keep it, will in all probability make a useful man." After years proved the correctness of this conclusion. Reuben is now a man of intelligence and wealth. He is one whom the world delights to honor; but among his pleasantest memories, I doubt not, is that of the barrel of flour he bought for his beloved mother.

"Filial love will never go unrewarded."

ANNE H.

Scrap-Book.

GEN. JACKSON AND THE CLERK.

MANY of our readers will recognize the point of the following joke, which we heard related "long time ago," but which we never saw in print.

While General Jackson was President of the United States, he was tormented day after day by importunate visitors, (as most Chief Magistrates of this "great country" are,) whom he did not care to see—and in consequence gave strict directions to the messenger at the door, to admit only certain persons on a particular day, when he was more busy with State affairs than usual.

In spite of the peremptory orders, however, the attendant bolted into his apartment during the afternoon, and informed the General that a person was outside whom he could not control, and who claimed to see him—orders or no orders.

"I won't submit to this annoyance," exclaimed the old gentleman, nervously. "Who is it?"

"Don't know sir."

"Don't know! What is his name?"

"His name? Beg pardon sir—it's a woman."

"A woman! Show her in, James; show her in," said the President, wiping his face, and the next moment there entered the General's apartment a neatly-clad female, of past the middle age, who advanced courteously towards the old gentleman, and accepted the chair proffered to her.

"Be seated, madam," he said.

"Thank you," responded the lady, throwing aside her veil, and revealing a handsome face to her entertainer.

"My mission hither to-day, General," continued the fair speaker, "is a novel one, and you can aid me perhaps."

"Madam," said the General, "command me."

"You are very kind, sir. I am a poor woman, General,——"

"Poverty is no crime, madam."

"No, sir, but I have a little family to care for—I am a widow, sir; and the clerk employed in one of the departments of your administration, is indebted to me for board, to a considerable amount, which I cannot collect. I need the money sadly, and come to ask if a portion of his pay cannot be stopped, from time

to time, until this claim of mine—an honest one General—of which he had the full value, shall be cancelled."

"I really—Madam—that is, I have no control that way. What is the amount of the bill?"

"Seventy dollars, sir—here it is."

"Exactly—I see. And his salary, Madam?"

"It is said to be twelve hundred dollars a year."

"And not pay his board bill?"

"As you see sir, this has been standing for five months unpaid. Three days hence, he will draw his monthly pay, and I thought, sir, if you would be kind enough to——"

"Yes, I have it. Go to him again and get his note, to-day, at thirty days."

"His note sir! It would't be worth the paper on which it was written; he pays no one a dollar voluntarily."

"But he will give you his note—will he not, Madam?"

"O yes, he would be glad to have a respite that way, for a month no doubt."

"That's right, then. Go to him and obtain his note, at thirty days from to-day; give him a receipt in full, and come to me this evening."

The lady departed, called upon the young lark, and dunned him for the amount—at which he only smiled—and finally asked him to give her his note for it.

"To be sure," said he, with a chuckle "give a note—sart'n—and much good may it do you mum."

"You'll pay it when it falls due, won't you?" said the lady.

"O, certainly," was the reply. And in the evening she again repaired to the White House with the note. The President put his broad endorsement on the back, and directed her to obtain the cash upon it at the bank.

In due time a notice was sent to the Clerk that a note signed by him will be due on a particular day, which he was requested to pay.

At first John could not conceive the source from whence the demand could come, and supposing that it had only been left for collection, was half resolved to take no notice of it. But as he passed down the avenue, the unpaid board bill suddenly entered his head.

Who has been foolish enough to help the old woman in this business, I wonder?" said John to himself "I'll go and see. It's a hum, I know; but I'd like to know if she's really fooled any body with that bit of paper!" and entering the bank, he asked for the note which had been left there for collection against him.

"It was discounted," said the teller.

"Discounted! who in the world will discount my note?" said John amazed.

"Any body, with such a backer as you've got on this."

"Backer! Me—backer—who?"

"Here's the note; you can see," said the teller, handing him the document, and on which John recognized the bold signature of the then President of the United States.

"Sold, truly!" exclaimed John, with a hysteric gasp, and drawing forth the money—for he saw through the management at a glance.

The note was paid of course, and justice was awarded the spendthrift at once.

On the next morning he found upon his desk a note which contained the following entertaining bit of personal intelligence:

SIR—A change has been made in your office. I am directed by the President to inform you that your services will no longer be needed in this department.

Yours, &c.,

— — —, Secretary.

John Small retired to private life at once, and thenceforth found it convenient to live on a much smaller allowance than twelve hundred a year.—*Rockland County Journal.*

SAY Oliver, can you tell what is the best thing to hold two pieces of rope together?"
"I guess knot."

THE ELEPHANTS OF THE EAST.

A PERSON who had never seen a wild elephant can form no idea of his real character, either mentally or physically. The unwieldy and sleepy-looking beast, who, penned up in his cage in a menagerie, receives a sixpence in his trunk, and turns with difficulty to deposit in a box, whose mental powers seem to be concentrated in the idea of receiving buns tossed into a gaping mouth by children's hands; this very beast may have come from a warlike stock. His sire may have been the terror of a district, a pitiless highwayman, whose soul thirsted for blood; who, lying in wait in some thick bush, would rush upon the unwary passer by, and know no pleasure greater than the act of crushing his victim to a shapeless mass beneath his feet. I have heard people exclaim, upon hearing anecdotes of elephant hunting, "Poor things!" Poor things, indeed! I should like to see the very person who thus expresses his pity going at his best pace with a savage elephant after him; give him a lawn to run upon if he likes, and see the elephant gaining a foot in every yard of the chase, fire in his eye, fury in his headlong charge; and would not the flying gentleman, who lately exclaimed, "Poor thing!" be thankful to the lucky bullet that would save him from destruction? There are no animals more misunderstood than elephants; they are naturally savage, wary, and revengeful, displaying as great courage when in their wild state as any animal known. The fact of their great natural sagacity renders them the more dangerous as foes. Even when they are tamed, there are many that are not safe for a stranger to approach, and they are then only kept in awe by the sharp driving-hook of the mahout. Elephants are gregarious, and the average number of a herd is about eight, although they frequently form bodies of fifty and even eighty in one troop. Each herd consists of a very large proportion of females, and they are constantly met without a single bull in their number. I have seen some small herds formed exclusively of bulls, but this is very rare. The bull is generally much larger than the female, and is generally more savage. His habits frequently induce him to prefer solitude to a gregarious life. He then becomes doubly vicious. He seldom strays many miles from one locality, which he haunts for many years. He becomes what is termed a "rogue." He then waylays the natives, and in fact becomes a scourge to the neighborhood, attacking the inoffensive without the slightest provocation, carrying destruction into the natives' paddy fields, and perfectly regardless of night fires or the usual precautions for scaring wild beasts. The daring pluck of these rogues is only equalled by their extreme cunning. Endowed with that wonderful power of scent peculiar to elephants, he travels in the day time down the wind; thus, nothing can follow upon his track without his knowledge. He winds his enemy as the cautious hunter advances noiselessly upon his tract, and he stands with ears thrown forward, tail erect, trunk thrown high in the air, with its distended tip pointed to the spot from which he winds the silent but approaching danger. Perfectly motionless does he stand, like a statue in ebony, the very essence of attention, every nerve of sense and hearing stretched to its cracking point; not a muscle moves, not a sound of a rustling branch against his rough sides; he is a mute figure of wild and fierce cagerness. Meanwhile, the wary tracker stoops to the ground, and with a practised eye pierces the tangled brushwood in search of his colossal feet. Still further and further he silently ereeps forward, when suddenly a crash bursts through the jungle; the moment has arrived for the ambushed charge, and the elephant is upon him.—*From the Rifle and the Hound in Ceylon.*

If a man waits patiently while a woman is "putting her things on," or "shopping," he will make a good husband.

MY LITTLE BOY.

BY G. DAVIES BRADWAY, M. D.

I HAVE a boy—as sweet a child
As ever on a father smiled;
With dimpled cheek, and sparkling eye,
And flaxen hair, and forehead high,
And laughing, sunny, little face,
Where sorrow ne'er has left a trace,
And voice—that falls upon my ear
Like to the murmurings of a brook,
Whose silver waters, bright and clear,
Flow gently from some shady nook.

I love that child—he is a part
E'en of myself—his little heart
Will seem with childish grief oppressed,
If "father" lays him not to rest,
Nor listens to his evening prayer,
Or sings for him some well-known air,
Which he has heard in days long past,
Ere he was left, my only one,
The bright, the fondest, and the last—
My household god—my little son.

Gleason's Pictorial.

A GOOSE STORY.

At the mills of Tubberakeena near Clonmel, Ireland, while in the possession of the late Mrs. Newhold, there was a goose, which by some accident, was left solitary, without mate or offspring, gander or gosling.

Now it happened, as is common, that the miller's wife set a number of duck's eggs under a hen, which in due course were incubated, and of course, the ducklings, as soon as they came forth, ran with natural instinct to the water, and the hen was in a sad pucker, her maternity urging her to follow the brood, and her selfishness disposing her to stop on dry land. In the meanwhile up sailed the goose, and with a noisy gabble, which certainly (being interpreted) meant, leave them to my care, she swam up and down with the ducklings; and when they were tired of their aquatic excursion, she consigned them to the care of the hen. The next morning down came the ducklings to the pond, and there stood the hen in her great frustration. On this occasion we are not at all sure that the goose invited the hen, observing her maternal trouble, but it is a fact that she being near the shore, the hen jumped on her back, and there sat, the ducklings swimming, and the goose and hen after them, up and down the pond. And this was not a solitary event. Day by day the hen was seen on board the goose, attending the ducklings up and down in perfect contentedness and good humor, numbers of people coming to witness the circumstances, which continued until the ducklings, coming to the days of discretion, required no longer the joint guardianship of goose and the hen.—*Our Drawer.*

APRIL FOOLS.—Our friend of the Albany Register carries his eyes in his head as he walks the streets of that quiet village, and narrates many curious and amusing incidents. Sometimes we suspect him of great inventive faculties—but the following story of an April joke, is as good as any we have seen:

Speaking of the beginning of April, will any body tell us where the custom came from, which makes every body try to fool every body, on the first day of that capricious month? We saw a funny thing on the first day of April down in Green street. Did any body ever see any body pass by an old hat on the sidewalk, without giving it a kick? We do not believe such a thing ever happened. Well, a wag seized upon this characteristic, out of which to make a little amusement, on "all fools day." So he procured a boulder, weighing some twenty pounds or more, and laying it upon the

sidewalk, placed over it an ancient weather-beaten hat.

The first person who passed that way, was a jolly, rollicking young man, who went whistling "Jordan is a hard road to travel," and as he came opposite the hat, placed so temptingly in his way, he gave it a rousing kick, expecting of course to see it go skiving into the middle of the street. But it didn't move, and the kicker picked up his toe in both hands, and hopped about, and became emphatic in his language, in a manner that made the perpetrator of the joke dodge around the corner. In a moment afterward, a gentleman came that way, with a cricket club on his shoulder, which he brought down with a swoop against the hat, expecting to see it take a hoist over the lamp-post on the adjacent corner. But it didn't; while the cricket club as it rung against the stone, flew half way across the street, and the striker fell to dancing about, blowing his fingers as if they were cold, and using a good many words not found in any religious work of that day. We stayed long enough to see a dozen or more assaults, perpetrated upon that old hat that concealed the boulder, and every time the attacking party got the worst of the bargain.

PRESERVATION OF VEGETABLES.—A French agriculturist has just published a process which he has employed for the preservation of beet-root, and which is equally applicable to potatoes, carrots, &c. The plan pursued by him is described as follows:—"At the time of gathering the crop I cut off the leaves, and having first strewed a layer of the ashes of liquites on the ground, place a layer of the beet-root on it, and then go on with alternate layers of ashes and beet-root until the whole are deposited, after which the pile is covered with ashes, so as to keep the roots from the cold, the air, and the light. Where the pile rests against a wall or a partition, ashes must be thrown between it and the roots. For want of the ashes of liquites, coal or turf ashes may be used, or even dry sand; but the last-mentioned article is not so effectual in absorbing the damp. This manner of proceeding prevents the roots from germinating, and consequently preserves them fit for use."

GAS NOT UNHEALTHY.—An opinion is widely prevalent that gas is unfitted for the illumination of private dwellings, owing to the heat and noxious gases it evolves: nothing can be more erroneous. The heat, it is true, is in proportion to the light given off; and if, as has been found to be the case, a four-inch pipe will supply as many burners sufficient to outvie the blaze of 2000 mould candles, (each candle consuming 175 grains of tallow per minute,) the quantity of caloric and carbonic acid given off will be found to be in each case pretty near identical. The Argand, or shadowless gas burner, if encircled by a pale blue glass, yields a perfectly homogeneous white light, as pure almost as that of day, enabling artists to pursue their labors as satisfactorily during the night as during the blaze of a southern summer's day. The expense of artificial light is in the following order, coal-gas being by far the cheapest, then vegetable oil, sperm oil, tallow, stearine, wax.—*New Quarterly Review.*

A WONDER.—The *Fermanagh Reporter* states that Mr. Phillip Monahan, of Drummackin, near Tempo, in this county, is a patriarch of 85 years, and a great grandfather; his wife is 60, some say much above it, without a tooth in her head. This venerable couple became, on the night of Friday last, the happy parents of a boy.

PRESERVE YOUR CONSCIENCE always soft and sensitive. If but one sin force its way into that tender part of the soul and dwell easy there, the road is paved for a thousand iniquities.—*Watts.*

BLUSHES are flying colors which maidens carry becomingly.

SWINISH.—A Paddy writing from the west, says pork is so plenty that "every third man you meet is a hog."

TEST OF GOOD HUMOR.—Wake a man up in the middle of the night, and ask him to lend you five shillings.

PEOPLE'S CHOICE.—Baron Rothschild, while complaining to Lord Brougham of the hardship of not being able to take his seat, said:—"You know I was the choice of the people." To which his lordship replied, "So was Barrabas."

SHARPENING UP.—A housemaid, who was sent to call a gentleman to dinner, found him engaged in using a tooth-brush.

"Well, is he coming?" said the lady of the house, as the servant entered.

"Yes, ma'am, directly," was the reply, "he's just sharpening his teeth."

THE prettiest lining for a bonnet is a sweet face.

REPAIRS vs. DAMAGES.—"Hallo, Sharp," said Pop, meeting him the other day in the street, "you hobble my boy; what's the matter with you?"

"Oh, I had my feet crushed, through the carelessness of a conductor, the other day, between railroad cars—that's all."

"And don't you mean to sue for damages?"

"Damages? no, no—I have had damages enough from them, already,—hadn't I better sue for repairs?"

CHOLERA FOR SALE.—A little girl being sent to the store to purchase some dye stuff, and forgetting the name of the article, said to the clerk, "John, what do folks dye with?" "Why, cholera, sometimes," replied John. "Well, I believe that's the name. I want to get three cents' worth."

CURIOUS.—The human hair (light hairs) held up to the sun, presents all the phenomena of the prism, giving the various colors of the rainbow. Isolated hairs will give at their end the circle, colored as the rainbow.

APPEARANCE OF THE CROPS.

EXTRACTS FROM EXCHANGES.

THE CROPS.—We never saw the Wheat, Grass, and Oats, look more promising in any former year than they do at the present time. Our accounts, also, from the adjoining counties, confirm this opinion. Where wheat was sown on low, wet, bottom-land, it has fared badly. Fruit—apples, pears, and cherries—promise a full crop; and even peaches, so far as we have seen, or are advised, have well escaped the rigors of the spring.—*Philadelphia Record*.

THE WHEAT CROP.—Many of our farmers are plowing up wheat fields to put in oats and corn—these fields being almost completely bare from the frosts of the winter. Other fields look pretty well; but it cannot be disguised that the prospect is gloomy indeed. We believe this is very much the case in Ohio and Indiana. But in these States farmers are putting in all the spring wheat they can, which will make up, to a considerable extent, the winter-killed.—*Mansfield Shield and Banner*.

THE wheat crop in western Virginia, is suffering greatly from the ravages of the joint worm.—*Havensville Eagle*.

THE WHEAT CROP.—Notwithstanding the wheat fields exhibited so many patches of winter-killed wheat in early spring, and though the prospect seemed discouraging over large portions of northern Ohio, northern Indiana, and southern Michigan, almost all our recent information tends to show that the wheat crop now appears unusually promising, especially in southern Michigan. One letter from St. Joseph county says: "The wheat crop is really fine.

I think I never saw it look more thrifty.—*Toledo (O.) Blade*.

FRUIT IN NEW-JERSEY.—The Hightstown (N. J.) *Record*, says the country is just now arrayed in bloom, and there is no doubt but that we shall have a much larger crop of apples than for some years past. Other kinds of fruit, from present indications, will also be abundant—the peach not excepted.

MR. HURLBERT, of Arkport, Steub. Co., N. Y., writes us, "Early sown wheat never looked better, and late sown wheat never looked worse, at this season of the year, than now. Corn here will be mostly planted this week."

SPECIAL NOTICE TO ALL SUBSCRIBERS.

WE find that by using such good paper, our volume of 832 pages will be quite large to bind, and especially large for those who wish to stitch their paper together with an index, without being at the expense of binding. To obviate this, we have concluded to be at the expense and trouble of making out an extra index with No. 26, so as to form a complete volume of the first 26 numbers. The index for the next 26 numbers will be given at the end of the year, or with No. 52. This arrangement will make it convenient for all, as the 52 numbers can be stitched or bound in two volumes with an index for each, or in one volume with the double index at the close.

We hope all will preserve their numbers, for there are many single articles each of which will be worth the price of the volume, for future reference. When the paper arrives from the post-office, a good plan is to see that it is properly folded, and then pin or sew it through the middle and cut open the leaves. It is very easy to stitch 26 numbers together. To do this, arrange them in regular order, and with an awl punch several holes about one-fourth of an inch from the back, and through these run a strong thread two or three times with a darning-needle, and the work is done. We have scores of volumes of papers, pamphlets, and addresses, thus prepared, which serve all the purposes of a bound volume, and occupy less room in storing and carrying. We would, however, prefer to see volumes of agricultural papers neatly bound and laid upon the book-shelves or tables of farmers. They are much better and more appropriate ornaments, than gilded volumes of trashy magazines or novels.

ONE WORD MORE.—We thank our friends for the liberal aid they have afforded us in extending the circulation of the *Agriculturist*. Our list has increased beyond our expectation, and we are daily encouraged to labor with the utmost diligence, to make our paper worthy of the confidence and admiration of our largely increasing list of readers. Our reliance for the continuance and increase of our list is upon those who are already readers. As stated above, we now divide the year so as to give either one or two complete volumes of the 52 numbers. Number 27 begins the second volume, or half of the year. We respectfully request all our present subscribers to make a little exertion at this time, and each send us on at least one new name. If you cannot get your neighbors to send on for a year, ask them to try the paper for six months, as in that time they will get a complete volume.

TO CORRESPONDENTS.—We have several communications on hand which we will look over as soon as we have time, and some of them will be published. It is no trifling labor to prepare for the printer many communications which we receive. Some are written so closely that there is not room to put in corrections, without re-writing the whole. We cheerfully prepare articles, unless there is manifest want of care on the part of the writer. If he does as well as he can, we make all needful changes and corrections.

As most writers doubtless wish to improve their own style, we suggest to them to keep an

exact copy of their communications, and then compare this copy with the printed sheet. They may often learn something in this way.

We are not anxious to receive original poetry. We have little space for rhyme, and we have good selections enough to last us a year at least. Good poetry, however, will not be rejected; but we advise all who attempt to write in verse to remember, that good rhyme does not constitute good poetry; on the contrary, some of the best poetry we have ever seen does not "rhyme" at all, while some of the best rhyme contains not a single poetic sentiment.

Markets.

REMARKS.—Flour no change of consequence since our last. Corn a further decline. Clover seed an advance of $\frac{1}{2}$ of a ct. per lb. Provisions nothing worthy of record. Wool dull with a downward tendency.

Cotton a decline of $\frac{1}{2}$ to $\frac{1}{4}$ ct. per lb. since our last. Sugar and Tobacco about the same decline.

Money is a little easier on first rate securities, but the Railroad acceptances are still passing at 12 to 15 per cent.—others less certain, from 15 to 20 per cent. There is actually no great let up in money matters, nor will there be till people very materially cease from incurring obligations.

MONDAY EVENING.—Tince the above was in type, we have later news from Europe by the steamer Franklin to the 10th inst. Flour, Corn, and Provisions were in good demand, with a slight advance in some instances.

The weather still continues wet, and planting is very backward.

PRODUCE MARKETS.

Saturday, May 20, 1854.

POTATOES are plenty to-day, and prices are falling. The quality is better than last week, apparently. Apples may be quoted same as last week. There are none but Russets in market. Most products are, as it was supposed they would be, lower in price than last week. The weather is getting quite warm.

Carter and Mercer Potatoes are worth \$4 $\frac{3}{4}$ bbl.; June, \$2 75; Common, \$2 25; Apples, \$3 $\frac{1}{2}$ \$5; Onions, \$2 50; \$3 50, and scarce; Carrots, \$1 75; \$2 25; Parsneps, \$2 50; Beets, \$2 50; Turnips, \$3; Green Peas, \$2 50; \$2 75; Asparagus, \$1 50; \$1 75, $\frac{3}{4}$ doz. bunches; Rhubarb, 50c. \$1; Lettuce, 25c. \$62 $\frac{1}{2}$ c.; Radishes, \$3 50 $\frac{3}{4}$ hundred; Butter, 17c. \$21c., $\frac{1}{4}$ lb; Cheese, 8c. \$11c.; Maple Sugar, 10; Eggs, 13c. $\frac{3}{4}$ doz.

NEW-YORK CATTLE MARKET.

Monday, May 22, 1854.

THERE are fewer cattle in the yards to-day, and they are held very high. The quality is nearer uniform than we have noticed hitherto, very few cattle being present which would not make passable beef. The day is warm and pleasant. The sales were rapid considering the prices, which are fully as high as we quote them. But it is not advisable for farmers and feeders to make to-day's prices a criterion for judging of future sales.

Swine are very low in price. The market is glutted, and the drovers say it is questionable whether a man could save money by bringing them from the West at present prices, if he had nothing to pay but the transportation and keeping.

Beeves sell from 11@12 cts. per pound.

Cows " \$20@30

Cows & calves \$30@60

Sheep sell from \$3@10, according to quality.

Swine " \$3 90@4 25 per hundred.

Calves " 4@6c. per pound, and things that one would recognize as calves only by their "bleat," sell from \$1 25@2 50.

Washington Yards, Forty-fourth street.

A. M. ALLERTON, Proprietor.

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY
Beeves,	1,856
Swine,	1,902
Cows,	25
Sheep,	237
Calves,	1132

The Hudson River R. R., brought 400 Beeves; Hudson River Boats, 200; Erie R. R., 700 and 248 swine; the Harlem Railroad 6 Beeves, 25 Cows and Calves, 237 sheep, and 1132 calves. The number of beeves from Ohio, are, 960; Kentucky, 237; Illinois, 329; New-York State, 194; Pennsylvania, 70.

In noticing cattle and their quality, we average the drove as near as may be, there being in most lots some much better than others. While some might be called extra, others are totally unworthy the name of beef or any thing else.

Messrs. J. VAIL & GURNEY had 99 head from Ohio, fed by S. Renwick. They may be classed as of middling quality.

D. W. BRADLEY had 103 head of good cattle from Ross county, Ohio, fed by J. Crouse.

B. SELDOMRIDGE had 37 head from Lancaster county, Pa., fed by Landis & Minich. Like all Lancashire county beeves, good.

R. MURRAY had 116 head from Pickaway county, Ohio—middling.

Mr. CONGER had 70 head from Madison county, N. Y., and 145 from Ohio—middling.

Mr. CONROD had 89 head from Pickaway county, fed by himself—Middling.

Jas. PERILL had 100 head from Pickaway co., fed by J. Rit-nour—Middling.

J. H. FOSTER had 70 head raised in Kentucky, and fed in Pickaway county, Ohio, by F. Ford. They are good.

D. BELDEN had 89 head from Ill., fed by Mr. French—Fair quality.

S. BUCKLEY & Co. had 58 head from Watertown, Jeff. Co., N. Y., distillery cattle—Good quality. They have more to come soon.

S. ULERY had 2(3 head from Fayette Co., Ill., fed by Pyatt & Harris—Good.

Wm. H. BELDEN had 70 head from Kentucky, mostly Dur-hams—Good.

Seventy-six head of cattle from Ohio were sold by W. E. Wheaton—Ordinary.

Ware & Parker had 96 head from Ky.—Good.

Mr. WILLIAMS had 100 head from Ross Co., Ohio, fed by J. Shorts.—Middling.

Mead & Holcomb had 35 head from Ohio.—Middling.

F. J. D. EASTON had 132 head from Ill., fed by A. G. Carle.—Middling.

SALE OF STOCK.

SECOND GREAT ANNUAL SALE OF DURHAM AND Dairy Stock, in Westchester County, N. Y., by JAMES M. MILLER, on the farm of JAMES BATHGATE, Esq., one mile from Fordham, and 14 miles from the City Hall, New-York City, by the Harlem Railroad, cars running hourly, will take place on Thursday, June 23d, 1854, at 12 o'clock M.

Having been solicited by numerous Cattle-breeders, as before, in my native County of Westchester, to get up a sale in which all may participate to any desired extent, whether wishing to sell one or more animals, and my old friend JAMES BATHGATE, having again kindly consented to give the use of his spacious premises upon which to make the sale, I have made the above announcement, and now invite all persons having high-bred and grade Cattle for sale, either in this or adjoining States, to participate in the advantages offered.

The name and full description of Animals intended for sale, with the owner's name and residence, must be sent to my Office, No. 81 Maiden Lane, New-York, on or before the 1st day of June next, to be inserted in the Catalogue, which will be ready for delivery on the 6th June; and the Cattle must be on the ground before 10 o'clock on the day of sale, or earlier, if possible, which will commence precisely at 12 o'clock, rain or shine.

The charge for selling, including all charge for Advertising, Catalogue, Commission, &c., will be Five Dollars per head, except when special bargains are made for calves or low-priced animals.

None but cattle of well-known breeds, of established character, will be received, and every animal offered must be sold without reserve.

JAMES M. MILLER,
No. 81 Maiden Lane.

VISITORS TO NEW-YORK CITY WILL FIND a pleasant stopping place at **SAVERY'S TEMPERANCE HOTEL**, 14 Beekman street, (near the park. Neat rooms with clean beds, at 35 to 50 cents per day. Meals furnished in the Dining-Saloon or in rooms, and a reasonable charge only made for dishes ordered. 37-11

THE NEW HYDROPATHIC FAMILY PHYSICIAN.—A Medical Adviser and Ready Prescriber, with references to the Nature, Causes, Prevention and Treatment of Diseases, Accidents and Casualties of every kind; with a Glossary, Table of Contents, and Index; the whole illustrated with nearly Three Hundred Engravings and colored Frontispieces. By JOEL SNOW M. D. One large Volume of 820 pages, substantially bound in Library style. Published by FOWLER & WELLS, 308 Broadway, New-York. This great work contains,

I. Anatomical, Physiological, and Hygienic Dissertations, illustrated with numerous engravings.
II. The Nature of Disease, Physiologically and Pathologically considered; Rules for Management in the Sick-room.
III. A description of the various Diseases to which the Human body is subject, with methods of Prevention and Cure, on Hydropathic principles.
IV. Management of Wounds, Hemorrhages, Fractures, Dislocations, Scalds, Burns, Poisoning, and other physical calamities. Illustrated.

V. The diseases of Females, with Advice and Directions for Home Treatment concerning Menstruation, Pregnancy, Childbirth, and the Management of Infants.

VI. The Water-Cure Processes fully illustrated and explained; Temperature of Baths, and the Philosophy of the Action of Water upon the Human System.

VII. The Effects of Air, Exercise, and Diet, with especial reference to the treatment of chronic diseases.

VIII. The Drug-Practice contrasted with Hydropathic and Physiological Treatment.

IX. Hydropathic Establishments; their Location, Formation, and Right Management.

X. The New Hydropathic Family Physician is the most elaborate and complete popular work on the subject. Every family should have a copy.

Price, delivered free, or with postage prepaid by mail, only \$2.50. The amount may be enclosed in a letter, and directed to FOWLER & WELLS, 308 Broadway N.Y.

Agents wanted in all the States. 37-39

WHEELER AND WILSON MANUFACTURING COMPANY'S IMPROVED SEWING MACHINES, manufactured at Watertown, Conn. Office and Warehouses, at 343 Broadway, N. Y.

These Machines have been in successful operation, in the hands of manufacturers and families, for the past two years, and in every case have given universal satisfaction. The Proprietors are now prepared to offer them to the public, with that increased confidence in their merits which the united testimony of their numerous customers has strengthened and confirmed.

These Machines are entirely different from any other, the principles on which they are made being exclusively our own.

Among the advantages of this Machine over any others are the following:

1. The simplicity of its construction, and the ease with which it can be kept in the most perfect order.

2. The perfect manner in which the operator is enabled to stitch and sew the various kinds of work, from the finest linen to the coarsest cloth.

3. It particularly excels in the rapidity with which work can be executed; in that respect it has no equal.

4. The little power required to propel them, enabling even those of the most delicate constitution to use them without injury to their health.

We are now manufacturing a larger sized Machine, more particularly adapted for the sewing of leather, canvass bags, and the heavier kinds of cloth.

An examination of our Machines is respectfully solicited at our Office, 343 Broadway. 37-49.

KETCHUM'S IMPROVED MOWING MACHINE WITH entire change of gear. The only successful mower now known.

Ketchum's Improved Machine, which we are building for the harvest of '54, was thoroughly tested last season, and the advantages gained by our change of Gear are in all respects as we designed, viz: durability, convenience and ease of action. The shafts now have bearings at both ends, which overcomes all cramping and cutting away of boxes. A counter balance is attached to the crank shaft, which gives it a steady and uniform motion. Each Machine can be thrown out of gear; there is great convenience in getting at each and every nut, all of them being on upper side of the frame; oil cups are attached to all the bearings, which, by the use of a wad of cotton, will hold oil for a long time, as well as protect the bearings from dust, grit, &c.; the finger bar is lined with iron its full width, which protects it from wear.

These and various other additions for strength, durability, &c., makes them the most simple and perfect agricultural implement in use. They weigh about 750 lbs. each, and can easily be carried in a one-horse wagon.

They will cut all kinds of grass, and operate well on uneven or rolling lands, or where there are dead furrows. This Machine took the highest award, with SPECIAL APPROBATION, at the World's Fair, it also received, during last season, one silver and four gold medals, and various other flattering and substantial testimonials of approval. We have spared neither pains nor money to make them deserving of public favor, and hope to be able the coming season to supply the great and increasing demand.

We take this occasion to caution farmers against buying UNTRIED Mowers, if they do (as was the case with many last year) they incur loss, vexation and disappointment.

In all cases where Extras are wanted, be sure to give us the NUMBER OF YOUR MACHINE.

(WARRANTY) That said Machines are capable of cutting and spreading with one span of horses and driver, from ten to fifteen acres per day of ANY KIND OF GRASS, and do it as well as is done with a scythe by the best of mowers.

All orders filled by the subscribers. Office and Shop, corner of Chicago street and Hamburg Canal, near the Eastern R. R. Depot, in Buffalo N. Y. HOWARD & CO.,

Manufacturers and Proprietors, For Sale by R. L. ALLEN, 189 Water street, N. Y.

The Mower is also manufactured by Ruggles, Nourse, Mason & Co., at Worcester, Mass., for the New-England States. By Seymour, Morgan & Co., Brockport, N. Y., for Illinois, Iowa and Michigan. By Warder & Brokaw, Springfield, O., for Ohio and Kentucky. 31-39

MACHINE WORKS.

M. & J. H. BUCK & CO.'S MACHINE WORKS, LEBANON, N. H. Manufacturers of a great variety of wood working machinery, of the most approved style, simple construction, and effective and firm operation, to be found in the country; comprising complete sets for making Railroad cars, doors, sash and blind, ship-building, bedsteads, cabinet, and carpenter work, &c., &c. Also, some machines of peculiar merit, such as for single and double Tenoning, capable of making from one to four tenons at the same operation of any width, size, or length, on large or small timber, with revolving cylinder attached. Also, an improved timber Planing machine, with the addition of a side cutter, with which the top and edge of timber or plank is planed, whether square or bevel, at the same operation, and in the same time occupied in planing but one side on all other machines. They also manufacture circular, single, and gang saw-mills, flouring and corn mills, hand and power hoisting machines for storehouses, shafting, hangers, pulleys, and mill gearing of all patterns.

AGENTS.—R. L. Allen, 189 & 191 Water st.; S. B. Schenck, 163 Greenwich st.; Andrews & Jessup, 67 Pine st.; Lawrence Machine shop, 51 Broad st., and Lawrence, Mass.; Leonard & Wilson, 60 Beaver st.; Wm. F. Sumner, Crystal Palace. [36-11]

MONEY FOUND.—A SUM OF MONEY FOUND IN THE seed store, No. 187 Water street, which will be paid to any claimant who can prove the property and date of its loss. R. L. ALLEN.

WILD TURKEYS.—TWO FIRST-RATE TURKEY COCKS of this breed. [35-36] Apply at 191 Water street.

WILD MEXICAN POTATOES.—These are raised from seed brought from Mexico three years ago. They boil dry and mealy, and are highly lauded for the table by those who have used them. They are as early as the Kidney, and the rot has not yet appeared among them. R. L. ALLEN, 189 & 191 Water st.

POUDRETTE.

THE LODI MANUFACTURING COMPANY OFFER their Poudrette for sale in lots to suit purchasers, from a single barrel up to 4000 barrels, at their usual rates, \$1.50 per barrel for any quantity, delivered on board of vessel in the city of N. York, free of cartage or other charge. When 2000 or 3000 barrels are taken, a deduction will be made from the above price. That this article has stood the test of fourteen years trial is proof of its efficacy. It is the cheapest and best manure for corn ever produced, and it has the advantage of being useful in small quantities and harmless in large. It is a capital manure for peas, strawberries, &c., and all garden vegetables. Apply by letter or personally to the Lodi Manufacturing Company.

GRASS SEEDS.—Ray Grass, Sweet Vernal, Orchard Grass, Timothy, Red Top, Blue Grass, Lucern, White Clover, Red Clover. [29-47] R. L. ALLEN, 189 & 191 Water street.

SALE OF STOCK.

PURE BRED STOCK AT PRIVATE SALE AT MOUNT Fordham, Westchester Co., New-York, Eleven Miles from City Hall, N. Y., By Harlem Railroad Cars.

Having met with more success than I anticipated the past year, with the Catalogue of male animals at Private sale, is the reason for offering this lot of animals, AND MY JUNE SALE BY AUCTION, WILL NOT TAKE PLACE. A full descriptive Catalogue with prices attached, will be published on the fifteenth of April, and I intend to be at home myself to see any who may call. I will sell at private sale, about 18 Short-Horns, 6 of which are young Bulls and Bull Calves. The Cows and Heifers old enough, will be in Calf, to the Celebrated Imported Bull, BALCO, (1918) or Imported, "ROMEO," winner of the first Prize at Saratoga, in 1853; and also at American Institute the same year.

The young Bulls and Bull Calves, are some of them from imported Cows, and sired in England; and others are sired by the imported Marquis of Carrabas, (11789) winner of the first Prize at Saratoga, the past year, as a two year old.

Also, about 10 head of Devons, consisting of a yearling Bull, sired by MAJOR, and 5 Bull Calves, sired by my imported first Prize Bull, FRANK QUARTLY, and several of them from imported Cows and Heifers, which will be in Calf to FRANK QUARTLY. Also 6 or 8 Suffolk Sows; and several young Suffolk and Essex Boars. 2d South-down Rams, imported direct from Jonas Webb; and 6 Yearling Rams, all bred by me, from Stock on both sides, imported from Jonas Webb. Catalogues will be forwarded by Mail if desired.

All Animals delivered on SHIPBOARD, or RAIL CAR in the City of New York, free of expense to the purchaser. The Devons are at my Herdsdale Farm, 12 miles north, to which place I will take persons both to and from.

MY FRIEND MR. N. J. BECAR, who is interested in several of my Importations, will also sell about 10 head of Short-Horns, consisting of 4 young Bulls, and 5 or 6 Females. His young Bulls are also several of them from imported Cows, and sired by the LORD OF ERYHOLME, (12305), and the celebrated first Prize Imported Bull, ROMEO. Mr. Becar's Cows and Heifers are in Calf to the imported Bull, MARQUIS OF CARRABAS, (2789). Mr. Becar can be seen at his Store, No. 187 Broadway, New-York, at which place he will make arrangements to go to his Farm, at Smithtown, Long Island. His animals will be entered in the same Catalogue with mine, which can be obtained by addressing him at his Store, or me at Mount Fordham. His animals will be delivered in the same manner as mine. Importations have been in almost all cases made at the same time, and are of equal merit, excepting that I have more in number.
L. G. MORRIS.
March 16th, 1854. 29-37

DIRECTIONS FOR THE USE OF GUANO.—A full and minute description of the different crops and soils to which Peruvian Guano is adapted, with full directions for its application, a pamphlet for 90 pages, and can be sent through the mail. Price 25 cents.
12-47. R. L. ALLEN, 187 and 191 Water st.

GARDEN IMPLEMENTS.

HEDGE, LONG-HANDLE, AND SLIDING PRUNING SHEARS; Budding and Edging Knives; Pruning Hatchets, saws and knives; pruning, vine and flower scissors; bill and Milton hooks; lawn and garden rakes; garden scullers, hoes of great variety, shovels and spades; hand engines, which throw water forty feet or more, syringes and water pots; grafting chisels, tree scrapers, and caterpillar brushes; transplanting trowels, reels; band plow and cultivator, very useful to work between rows of vegetables, together with a large assortment of other implements too numerous to mention.
[24-7] R. L. ALLEN, 187 and 191 Water-st.

MORRIS FEMALE INSTITUTE.

THIS INSTITUTION IS SITUATED AT MORRISTOWN, N. J., about an hour and a half's ride from the city of New-York, on the Morris and Essex railroad; the cars leaving New-York several times a day. It has been ably patronized for the last six years. There will be a vacancy for a few more pupils in April.

Faithful teachers are provided for English branches usually required; also Drawing and Painting. French, Latin, and Spanish under a native teacher.

Vocal and instrumental music by an accomplished player, whose time and attention has been for years devoted exclusively to this object.

Further particulars, and circulars, may be obtained by applying to J. A. SEELY, Principal, or at the book-store of Messrs. C. Shepard & Co., 152 Fulton street, near Broadway, or at this office.

Persons wishing to send their daughters from home, would do well to visit this Institution before deciding. 27-47

NO. 1 SUPERPHOSPHATE OF LIME.—THIS VALUABLE fertilizer has been used for several years in England and other parts of Europe, and, next to Guano, holds the highest rank in popularity, and the extent to which it is used among farmers. Its introduction in this country has been more recent; but the progress it has made in the estimation of the public has not been less marked or successful than abroad. It is now extensively used throughout the Northern States, after a full trial and investigation of its merits; and it is rapidly becoming, like its predecessor, Guano, a favorite manure at the South and West.

It is composed of crushed or ground bones, decomposed by the addition of about one fifth their weight of sulphuric acid, diluted with water, to which is added a due proportion of guano and sulphate of ammonia. The latter is the active and one of the most efficient agents in the best Peruvian Guano.

It is suited to any soil in which there is not already a full supply of the phosphates, which is seldom the case. All crops are benefited by its application.

For sale in large or small quantities, in bags of 150 lbs. each. No charge for packages. All bags will be branded "C. B. De B." No. 1 Superphosphate of Lime.

PERUVIAN GUANO of best quality.

AGRICULTURAL and HORTICULTURAL IMPLEMENTS of all kinds.

FIELD and GARDEN SEEDS, of various sorts, fresh home grown and imported.

THE AMERICAN AGRICULTURIST—weekly, \$1 per volume—two volumes a year.

For sale at R. L. ALLEN'S Agricultural Warehouse and seed Store, 189 and 191 Water street, New-York. 25-47

MUSQUIT GRASS.

THE TRUE MUSQUIT GRASS, GROWN BY A CAREFUL Georgia Planter. This has proved the most sure and valuable grass for stock yet cultivated at the South, and is invaluable to the planter. For sale by RICHARD PETERS, Atlanta, Ga., also by R. L. ALLEN, 189 and 191 Water St., N. Y. 27-47

WILLARD FELT, NO. 191 PEARL STREET, (NEAR Maiden Lane.) Manufacturer of Blank Books, and Importer and Dealer in Paper and Stationery of every description. Particular attention paid to orders 26-77

GARDENER FOR THE GREEN-HOUSE AND GRAPE-HOUSE.—Wanted a Gardener as above, who is experienced in the management of the Green and Grape-House in the United States. None need apply except fully qualified. 23-47 A. B. ALLEN, 189 Water st.

AGRICULTURAL IMPLEMENTS.—THE SUBSCRIBER keeps constantly on hand, and offers for sale the following valuable implements:
Fan Mills of various kinds, for rice as well as wheat, rye, &c.
Grain Drills, a machine which every large grain planter should possess. They are of the best patterns, embracing most valuable improvements.
Smut Machines, Pilkington's, the most approved for general use.
Hay and Cotton Presses—Bullock's progressive power-presses, combining improvements which make them by far the best in use.
Grain mills, corn and cob crushers, a very large assortment of the best and latest improved kinds.
Horse Powers of all kinds, guaranteed the best in the United States. The embrace—1st. The Chain Power, of my own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, and economy. They are universally approved wherever they have been tried. 2d. The Bogardus power, for one to four horses. These are compact, and wholly of iron, and adapted to all kinds of work. 3d. Eddy's Circular Wrought Iron Power, large cog-wheels, one to six horses, a new and favorite power. 4th. Trimble's Iron-Sweep Power, for one to four horses. 5th. Warren's Iron-Sweep Power, for one to two horses.

R. L. ALLEN, 187 and 191 Water street.

STOCK.

IMPROVED STOCK OF ALL KINDS.—HAVING had great experience in breeding and rearing line stock for the past twenty years, I offer my services to my friends to procure it of the best and most reliable kinds. As much notice as convenient is at all times desirable previous to purchasing, as it takes time to make good selections. Early in August or September is the best time to purchase for the South.

Short Horn or Durham cattle, Devons, Herefords, Alderney or Jersey and Ayrshires. Long-wooled Sheep—the Cotswold, Oxford, Leicester, Bakewell, and Lincoln. Mutton Sheep—the Southdown. Fine-wooled Sheep—such as the Saxon, Spanish, and French Merino.

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, which are spurious.

1-47 A. B. ALLEN, Nos. 189 and 191 Water st.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master, and ask him to and the County and State. *Write these very plainly.*

Clubs may add to their number at the same rate per copy as was paid by the original members.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished with Harper's Magazine, one year for	\$4 00
" Putnam's do	4 00
" Knickerbocker do	4 00
" Eclectic do	6 00
" Little's Living Age do	6 50
" National Magazine do	3 50
" Dickens's Household Words	3 50

Address ALLEN & CO.,
189 Water street, New-York.

J. A. GRAY, Printer, 95 and 97 Cliff street, N.Y.

PUBLISHERS' ANNOUNCEMENT!

Twelfth Volume of

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B. The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume for the bound work.

COMPREHENSIVE IN ITS CHARACTER,
